CORRESPONDENCE.

THE SITE OF HOMER'S TROY.

6 Pelham Place, S.W.: March 27, 1874.

The discoveries of Dr. Schliemann at Hissarlik have excited so much discussion, that in addition to what has already been said on the subject, it may be well to bring forward the following *mathematical* disproof of his assertion that he has been working upon the site of Homeric Ilium.

Hissarlik has long been identified with the site of Novum Ilium, the village-city whose inhabitants claimed that it stood on the site of the ancient Ilium of Homer, and which was embellished and raised to the rank of city by Alexander the Great after his victory at the Granikos.

These pretensions were refuted, long ago, by Demetrius of Skepsis, quoted by Strabo as an authority "who was acquainted with these places, for he was a native," the main and insuperable objection to them being the distance of Novum Ilium from the shore of the Hellespont. This distance is now 2½ miles, but Strabo mentions that the alluvium or silt brought down and deposited by the Skamander had extended over a distance

of six stadia ($\frac{3}{4}$ of a mile) during the interval between the Trojan war and his time. Deducting from this fact the rate of the increase of the alluvium, we shall find the increase from the date of the war to the present day to have been 1½ mile. It follows, therefore, that what is now the lower part of the Trojan Plain was at the time of the war a Bay.

If, then, from the modern coast-line we measure inland a distance of 1½ mile, we shall reach what was then the head of this Bay, the ancient beach upon which the invaders ranged their galleys and formed their camp. Now to the distance thus measured we must add the depth of the camp itself; this, Aristarchos tells us, was five stadia ($\frac{3}{4}$ of a mile). Thus the whole distance from the modern coast-line to where the line of rampart in front of the camp was erected, is 2½ miles.

But we have already seen that 2½ miles is also the distance of the site of Novum Ilium (Hissarlik) from the present shore, so that if Homer's Ilium stood here, the Greek rampart must have been immediately beneath its walls, which we well know it was not. Therefore Novum Ilium did not stand on the site of Homer's Ilium.

We know, on the contrary, that there was a wide-spread Plain between the camp and the besieged city, the battle-field in which were fought the four pitched battles described in the Iliad, battles replete with complicated manoeuvres, both in chariots and on foot, and with alternate advances and retreats.

Further, we know that the Skamander flowed between the city and the camp; for Hektor wounded in the third battle is carried back to the ford of the river midway between the camp and the city; Priam crosses the river at the same ford when on his way from the city to the tent of Achilles; at the end of the second battle the victorious Trojans encamped in the Plain between the Grecian camp and the river.

These facts would seem to be amply sufficient to render the identification of Novum Ilium with the Ilium of Homer quite impossible; but many other arguments could be adduced, among them the fact that nowhere near the site of Novum Ilium are there to be found two springs or fountains anything like those which issued from the earth close to the wall of the Homeric city, and of which there is such a striking description in the twenty-second Iliad.

Where then was the Homeric city? If the Iliad be studied with careful reference to the topography of the Trojan Plain and the various movements of the contending armies, its precise site becomes an absolute certainty. The excavations and researches of Le Chevalier, Mauduit, Hahn and Nicolides have conclusively proved that site to be the high ground behind the village of Bounarbashi at the head of the Plain. Here were discovered and laid bare Pelasgic walls, identical in style with those of Tiryns and Mykenae, and other examples of the polygonal architecture of the heroic ages; here are two remarkable springs very like the "Fountains of Skamander;" here is illustrated every epithet of Ilium to be found in the Iliad.

It only needs a study of the works above-mentioned, and of the passages of the Iliad elucidated by them, to convince us that not all the "treasures of Priam" could bribe us to forsake the firm ground upon which we stand when we assert that Homeric Ilium was situate upon the "wind-swept" heights of Bounarbashi.

WENTWORTH HUTSHE.

A PASSAGE IN AESCHYLUS.

St. Leonard's: March 30, 1874.

I think M. François Lenormant has mistaken the meaning of a passage in the *Suppliques* of Aeschylus, and founded an argument on it which cannot be sustained. When the poet says, "A Cyprian likeness has been stamped on female forms by male artists," he does not refer to *costume* at all, but to the physical features of the daughters

of Danaus. The use of *χαρκτηρ* for the impression on coins is well known. The passage is of especial interest, because it is the earliest which gives positive evidence of the striking of coins by a hammer and a die. In an ethnological point of view, it also goes far to establish an important fact, that nearly five centuries B.C. the women of Cyprus were hardly distinguishable in feature and appearance from the women of Libya, and those of the Nile valley.

F. A. PALEY.

PUTTENHAM'S PARTHENIADS.

March 30, 1874.

Speaking of these, a paragraph in the *ACADEMY* of March 21 states that they "have been supposed to be lost," and querying the copy in Cotton MS. Vespas. E. viii. with "How then has Mr. Morfill identified this work with Puttenham's poem?"—replies: "By finding that its sixteenth set of verses contain the line[s] quoted by Puttenham in the following extract, &c." But not only were these poems reprinted by Mr. Haslewood, as stated in the paragraph, but their manuscript source was given, and they were identified by him as part of Puttenham's Partheniads by no fewer than thirteen quotations, including one not stated by Puttenham to be from a Partheniad, but curiously enough omitting a fourteenth, or almost the whole of the twelfth Partheniad, where, to avoid the chance of errors, the MS. copy requires to be compared with Puttenham's text. In Arber's reprint also of *The Arte of English Poesie*, p. 11 of the Introduction, the oneness of the Cotton MS. poems with "the Partheniades of our author," is distinctly stated, and their imperfect number and malpositions noticed.

Hence while it be a boon that they should be again reprinted, it cannot be said since 1811 that they have been supposed to be lost, and Mr. Morfill, whose name is mentioned, will be among the first to give credit to a former worker such as was Mr. Haslewood.

B. NICHOLSON.

THE DEMOLITION OF CITY CHURCHES.

II.

March 30, 1874.

Over the grave of the great Sir Christopher is the epitaph "Si queris monumentum circumspicere," and I think there can be little doubt that this refers not only to the great cathedral in which he reposes, but to the city which surrounds that noble church. Who, looking at this mighty city from any of the bridges which span its river, can fail to be struck with the fact that it is not mere accident which produced that marvellous group of towers and spires, all concentrating in the superb dome of St. Paul's; for, in order to give superior dignity to that masterpiece, it will be noticed that the churches which stand nearest to it are provided with thin and delicate spires which, by their attenuated outline, impart an appearance of grandeur and immensity more than it would otherwise command; so that the "Si queris monumentum, circumspicere," not only asks you to look at the cathedral, but to notice its matchless combination with the surrounding churches and buildings; and although the numerous lofty warehouses and railway stations have done much to mar the effect which Wren desired to produce, enough still remains to indicate the nobleness of the design.

I am glad to hear that two plans have been suggested for the partial preservation of the threatened churches, and one of these plans would still retain the general impression intended by Wren. It is to preserve the towers of the churches, but to destroy the other portions of them. I believe this plan was first suggested by Mr. Penrose, the architect to the Dean and Chapter of St. Paul's Cathedral. Of course it must be understood that this plan is only suggested by Mr. Penrose as a last resource.

Another proposition which has been suggested is to the effect that these churches should be pulled down and removed *piecemeal*, and rebuilt

in their present form in the various suburban districts which require them. Now it seems to me that there are two great objections to this plan. In the first place, my experience is that when an old building once gets pulled down, a thousand reasons for not rebuilding it are easily forthcoming. Your readers will recollect the fate of the beautiful church of Trinity College, Edinburgh, which was pulled down by the railway company on the strict understanding that it should be rebuilt; but, alas, what has become of this promise? Another objection to the plan of removing these churches is the fact that they were all built to suit certain sites, and would very probably lose their character if removed to other places. They are too essentially city churches, and would look out of place in Bayswater or Brompton; not that they would ever look as much out of place as some of the Gothic churches which we now build in those regions, and which are only suited to a Northamptonshire village.

Either of these proposals would be far preferable to the destruction of these buildings; but I cannot approve of either, or in fact of anything short of the retention of all the churches in their present sites. I am glad to see that the clergy of several of the threatened churches have set hard to work, and are restoring them so that there may be no excuse that they are in a state of decay; unfortunately, however, some of the restorations and embellishments are not in the best taste; and I must really protest against the attempts that are being made in some places to convert the interiors of these churches into what is called "freely treated Romanesque" or "round arched Gothic." These churches are all fine examples of English Renaissance style, and if an architect or a clergyman has to restore or decorate them, he should keep to that style, which is a far purer and more perfect one than the so-called "Romanesque" or "round arched Gothic" of the nineteenth century. I should also suggest that Italian organs do not look more Gothic by having their cornices knocked off and their pipes painted blue and red and powdered with gold stars and sprigs; and that when large Renaissance windows are filled with stained glass, the glass should not be in a style six centuries earlier than the windows themselves; and yet I am sorry to say the interiors of many of the finest Renaissance churches in London have been ruined by these attempts to convert them into a kind of bastard Romanesque.

In many of the City Churches, the western choirs and organs have been removed to the chancel, and where the church has sufficient length for this to be conveniently done it is advisable; but in some of the nearly square churches in the City, where this operation has been carried out, the effect is simply abominable.

Now let us glance at some of the more important of these doomed churches.

St. Benet, Paul's Wharf, in Great Thames Street, is one of Sir Christopher's earlier works, and is a very interesting little church. Its erection was commenced directly after the great fire. It consists of a single nave, and a tower of moderate height crowned with a dome, out of which rises a small lantern crowned with a spire. The whole church is built of brick with stone dressings; it has a singular Dutch look about it, and although plain, is a singularly picturesque and pretty little building, and shows what genius can do with very simple means and at small cost. Inigo Jones is buried in this church.

St. James, Garlick Hill, and St. Michel Royal, are chiefly interesting for the great beauty of their towers. In each case the tower is crowned by an open lantern of stone surrounded by a colonnade, but in one case the lantern is square, in the other octagonal. These lanterns are again crowned by others of smaller dimensions, which terminate in little domes. Both are charming pieces of design, and have a remarkably picturesque appearance from the river. St. James's

contains an organ by the celebrated F. Smith, dated 1697, and St. Michel's contains a well-carved altarpiece and a marble font; both are handsome churches, and are constructed of finely-squared Portland stone. St. Michel's was originally built or rebuilt by Whittington, and he was buried here; but his monument, together with the church, was entirely destroyed by the great fire. Both of these churches were erected from designs by Wren. The former of them was not completed till the year 1689, and both may be looked upon as good examples of Wren's more mature style.

St. Mary Abchurch is another very interesting church, also by Wren. Its general appearance greatly resembles that of St. Benet, Paul's Wharf, and like that building it is constructed of brick, with stone dressings; its tower is an example of Wren's happy combination of dome and spire, and like St. Benet's this may be looked upon as one of Sir Christopher's picturesque buildings. The interior of this church is decorated with fine carvings in wood by Grinling Gibbons, and the ceiling is painted by Thornhill; the font, pulpit, and one or two monuments, are worthy of notice.

St. Nicholas Cole-Abbey and St. Michel's Queenhythe are good examples of Wren's work, but have no very striking features; both have metal spires of good outline.

St. Edmund the King, Lombard Street, possesses one of the most highly ornamented fronts of any of the City churches. It was erected in the year 1690; and although it is said to be a work of Sir Christopher Wren, it is wilder and less chaste and simple than his works generally are. It is, however, a handsome church, and is interesting from the fact of its being so very unlike any other church in the City, or even in England; in fact, there is rather a German look about it.

Allhallows the Great, Thames Street, is in every respect the reverse of the former church; it is plain to severity, and could never have had an existence out of England. It was erected from a design by Wren in the year 1686. Unlike the other churches which we have described, this one consists of a nave and aisles, and it may be doubted whether Wren did not follow the outlines of the old Gothic church when rebuilding it after the fire. As the general arrangement of the building is far more Gothic than Renaissance, like a Gothic church, also, it possesses a square tower, with a simple parapet, and no kind of dome or spire. Internally this church contains some finely carved woodwork, especially a screen, the only one of the kind existing in any of the City churches.

St. Mary-at-Hill is the only one of the churches upon the list which is not the work of Wren. I am unable to discover the name of the architect. The exterior of this building is very ugly and uninteresting, and it has a square embattled tower of brick which is quite repulsive. The interior, however, is the cleverest treatment of a square church I have ever seen. From each wall project large square pilasters and detached Ionic columns, which bear up eight wide arches supporting the pendentives of a domical vault. The effect of the whole is singularly happy and well worthy of study.

St. Mary Aldermanbury, St. George Botolph Lane, and Allhallows Lombard Street, are all works by Wren, or were carried out under his direction. They are good substantial churches, plain and simple, but dignified in proportion, and thoroughly pleasing as to their general outline; and it cannot fail to strike every one who studies the subject that one of Wren's greatest gifts was the power of giving dignity to small buildings. Many of these churches which I have attempted to describe are only 60 feet long and about 40 feet wide, and not one of them is more than 90 feet long; and when it is taken into consideration that these churches are surrounded by high houses and lofty warehouses, it is remarkable how well they retain their position, and how large and dignified they look. This is probably owing to the extreme simplicity of their plans. Where a

modern architect would build a nave, aisles, chancel, and side porches, Wren built simply one large nave; and instead of dividing his building horizontally with aisles, roofs, and a receding clerestory, he carried up his walls to the greatest possible height and pierced them by a single row of large windows; with little ornament and less sculpture he obtained a look of richness by keeping the walls very flat, so that every object projecting from them did double duty—firstly by its own intrinsic elegance, and secondly by the sharply defined and cleanly cut shadow which it cast upon the wall. But no ornament was used without a reason; not a line, or a quoin, or a moulding, or a garland was wasted. Every single detail did its duty in improving the general effect of the whole building. In conclusion, I cannot help adding that, although Wren's churches are erected in the Renaissance style, they to my mind display far more of the real principles of Gothic architecture, far more of that love of truthful construction and appropriateness of ornament which actuated mediaeval builders, than is to be seen in most of the buildings erected since the so-called "Revival of Gothic Architecture." H. W. BREWEB.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, April 4,	3 p.m.	Crystal Palace Concert: <i>Hymn of Praise.</i>
	8 p.m.	<i>Messiah</i> at the Royal Albert Hall.
	"	First night of Mr. Albery's <i>Wig and Gown</i> at the Globe.
	"	First night of Mr. Reece's <i>May</i> at the Strand.
	"	<i>The School for Scandal</i> at the Prince of Wales's.
MONDAY, April 6,	2 p.m.	Royal Institution: Monthly General Meeting.
	3 p.m.	Opening of International Exhibition: Grand Vocal and Military Concert.
	8 p.m.	<i>The Clandestine Marriage</i> at the Gaiety.
TUESDAY, April 7,	8 p.m.	London Anthropological Society.
WEDNESDAY, April 8,	7 p.m.	London Institution: Professor H. Morley on "English Poets of the Nineteenth Century."
	8 p.m.	British Orchestral Society.
THURSDAY, April 9,	1 p.m.	Sale of the late Mr. E. W. Radcliffe's Pictures by Messrs. Christie, Manson & Woods.
FRIDAY, April 10,	7.30 p.m.	Sacred Harmonic Society, Exeter Hall: <i>Judas Maccabaeus.</i>

SCIENCE.

Etruscan Researches. By Isaac Taylor. (London: Macmillan & Co., 1874.)

First Notice.

ALL attempts at explaining the Etruscan Inscriptions have hitherto failed. In spite of great learning and ingenuity expended on the subject, both by Aryan and Semitic scholars, the Etruscan Sphinx still keeps her secret. A new attempt to solve her riddle has lately been made by Mr. Isaac Taylor, in his *Etruscan Researches*. As both the Semitic and Aryan keys have failed, he has tried a Turanian key. He has certainly turned his key once or twice, but the lock is not opened, and the reason why the key turned round at all was simply because it is very smooth and small, and has very few wards. Mr. Taylor speaks of about one hundred Turanian dialects, and thinks we may have recourse to any one of them in explaining Etruscan words. With such latitude, any short inscription, whether Latin or Phoenician, might be proved to be Turanian. Turanian has become a most mischievous element in the Science of Language, and as I am myself to a great ex-

tent responsible for that term, I feel it my duty to protest thus publicly against the use that has been made of it. When I wrote my *Letter to Bunsen on the Turanian Languages*, in 1853, my object was to protest against a then generally prevalent and, as I thought, mischievous dogma, which denied the possibility of any kind of relationship of languages, except that close genealogical relationship which holds the Aryan and Semitic families together. I endeavoured to show that languages might have had a common origin during their radical stage, and have attained to a far wider divergence in their agglutinative and amalgamative development than that which separates Sanskrit from English, Hebrew from Arabic. It is one thing to have shown that the Tunic, Mongolic, Turkic, Samoyedic, and Finnic languages form one real family of North-Turanian speech, to have pointed out that the deepest roots of that family may reach as far as Chinese, and to have indicated the possibility of a connexion between Chinese and some of the South Turanian languages, such as Siamese, Tibetan, Burmese, the Malay, and Dravidian tongues; it is quite another thing to throw all these languages together, to add to them the Caucasian dialects, the Bask and even Egyptian, and then to look in this chaos of words for similarities with one given language, viz., Etruscan. My essay was written in pre-Darwinian days, when scholars had eyes for specific differences only, and when any attempt to point out the possibility of development, even as a theory, even as a mere protest against linguistic dogmatism, was branded as unscientific. All this is now changed. The danger now comes from the opposite quarter; and however I may rejoice at the spreading of larger, more philosophical, or, if you like, more Darwinian views in the Science of Language up to a certain point, I should be false to my allegiance to Bopp and Pott and Grimm, were I not to protest against what is a dangerous though popular dogma now, as I protested against what was a dangerous though popular dogma then. There is ample room for development theories in the growth of language; in fact, there is no field in the whole of nature, not excepting the *Kalk-schwämme*, where a richer harvest waits for Darwinian reapers; but there are limits beyond which these theories must not go. In what sense a comparison of Aryan, Semitic, and Turanian roots is allowable, in what sense we may speak theoretically of a common origin of roots, I have endeavoured to show in my *Lectures on Darwin's Philosophy of Language*. Within the limits there traced, I adhere as firmly as ever to the principles laid down in my *Letter to Bunsen*. But these principles refer to prehistoric, not to historic periods of human speech; they refer to what is "*becoming*" not to what has "*become*;" they are intended, in fact, to explain the process by which languages became specialised, not to slur over the special characteristics of languages, after they have once been developed and fixed. Thus, to return to our subject, when the Achaemenian Cuneiform Inscriptions had to be deciphered, no scholar would have ventured to treat them as Aryan in general, or to explain one word as Sanskrit, another as Greek, another

as Latin, German or Celtic: they had to be explained as written in *one* language, specialised phonetically, grammatically, historically—viz., in Persian—and every word occurring in them had to appear in its proper Persian garb, or leave the room. Where we find in Sanskrit an *s*, these inscriptions must give an *h*; wherever we find in Sanskrit an *h*, these inscriptions must give a *d*, and so on. Thus, and thus only, could the decipherment of these inscriptions lay claim to a scientific character. Compared with Turanian, however, the Aryan family of languages is like a small lake by the side of an ocean; and it is easy to imagine what the result must be, if any ancient inscription is said to have been deciphered as *pan-turanian*. There is still one loophole that must be stopped. It might be said that the Etruscan language was very ancient, and that it represented the one undivided Turanian type of speech, before it was broken up into dialects. First of all, that division would have taken place many thousands of years before there was any idea of writing; secondly, Etruscan, during the interval, would have become specialised by exactly the same influence as the other Turanian dialects; thirdly, the whole conception of a primitive and perfect type, broken up into species, is, in this crude form, both philosophically and historically, untenable.

Not to be unjust, however, to Mr. Taylor, it ought to be stated that, in his interpretation of Etruscan words, he confines himself generally to two Turanian clusters of dialects, and that he gives his reasons for doing so. He thinks that there was in Etruria, as in all Europe, an aboriginal stratum of Finns; that these were followed by Aryan settlers; and that lastly the Etruscans, or the Rasenna, came from Central Asia—a race of Turkmans, whose language is said to be most accurately represented at present by the dialects of the Kot-Yenisei, and the Yenisei-Ostiakes, tribes which till fifty years ago claimed for themselves the designation of *Assan* or *Assena*, identified by Mr. Taylor with *Rasenna*. These two dialects are, according to the classification adopted in my *Letter on the Turanian Languages*, which is in the main followed by Mr. Taylor, Samoyedic, so that what Mr. Taylor really undertakes to do, is to interpret the Etruscan inscriptions by means of the languages of the Finns and Samoyedes.

This is, no doubt, a bold undertaking, and we are justified in asking, was Mr. Taylor well prepared for it? Had he, before attempting the most difficult task that a scholar can attempt—the deciphering of old inscriptions—made himself a thorough Finn and Samoyede scholar; or had he, at least, examined so far into the nature and history of these two languages as to be clear on two points:

1. Whether these languages contain any Aryan elements;

2. Whether, by taking a quantity of words at random, there may not be a number of fortuitous coincidences between Finnish, Aryan, and Semitic words.

The first point has been fully examined by scholars such as Ihre, Rask, Dietrich, Grimm, Munch, Lindström, Ahlqvist, Europæus, and Thomsen, and quite lately again by Donner; and it is a well-

established fact, that Finnish is full of Aryan words, some of them borrowed in comparatively modern times, others at a very early period. The early date of this second class has to be admitted for two reasons:—

1. Because many of these words, of Teutonic origin, exhibit a form more primitive than Norse and Gothic.

2. Because some of them found time to spread beyond Finnish and Lappish into other Altaic languages.

As to the second point, I had shown in my *Letter* that there are fortuitous coincidences between Turanian, Aryan, and Semitic words; and a very easy experiment would have served as a warning against trusting to ten or twelve even startling coincidences between Etruscan and Finnish words as evidence of a common origin of these two languages.

I have already expressed my opinion on the conclusions which Mr. Taylor has attempted to draw from the Etruscan numerals (*ACADEMY*, Jan. 3). If Mr. Taylor had read the warning words of Pott on this subject, he would probably have felt that the verdict of such a judge could not be easily set aside. That Nestor among comparative philologists, who is certainly not deficient in boldness, and who had made a profound study of the numerical systems in the Aryan, Semitic, and Turanian languages, declared, against both Stickel and Lorenz, his conviction that the so-called Etruscan numerals were neither Aryan nor Semitic, nor anything else but "the last echo of a world totally sunk into ruins." The coincidences pointed out by Mr. Taylor between Etruscan and Turanian numerals, even granting all his premisses, carry no conviction whatever to any one acquainted with the subject. Even granting that *Ki* in Etruscan meant two, and not five—which in the present state of the interpretation of the Alethnas inscription is very problematical—that would not prove that the Etruscan numerals are Turanian. There are much stronger coincidences between Turanian and Aryan numerals than any pointed out by Mr. Taylor in Etruscan; and yet these coincidences have been fully accounted for. Hundred in Finnish is *sata*, Lappish *chuötte*, Mordvinian *sada*, Tcherimissian *shydö*, Sirianian *so*, Votiakian *su*, Ostiakian *söt*, Vogulian *sat*, Hungarian *száz*. Is not this the same as the Sanskrit *sata*, Latin *centum*, Greek *ἑκατόν* (the *κ* being palatalised, not labialised), and, therefore, Old-Slav. *süto*, Lithuanian *szimta-s*, Gothic *hund*, Engl. *hundred*? Again, thousand in Hungarian is *ezer*, Vogulian *sater*, Ostiakian *táras*, Votiakian and Sirianian *šurs*, Turkish *hezâr*, Avarian *azargo*, Uidian *hazar*, Tchetch *ezir*, while in Sanskrit it is *sahasra*, in Zend *hazañra*, Persian *hazâr*, Afghan *zir*. In Finnish, thousand is *tuhát*, Lapp. *duhat*, Mordvin. *tózhän*, Tcherem. *tishem*, while in Lithuanian it is *tukstantis*, in Old-Slav. *tysashta*.

These and many other coincidences have been explained, partly as the result of early borrowing, partly as the result of independent growth; and although Dr. Donner, in his excellent work, *Vergleichendes Wörterbuch der Finnisch-Ugrischen Sprachen*, transfers several words, which had been placed in the first class, into the second, yet neither he nor

his predecessors would look upon any of them as evidence of a common origin of Aryan and Turanian speech. That origin, if it can ever be reached by any scientific method, lies far beyond the horizon of such ready-made words, it lies even beyond the stage that is represented by such fully developed roots as are contained in the Finnish *kuulen*, I hear, Lapp. *gulum*, Mordvinian *kulán*, Tcheremissian *kolam*, Sirianian *kyla*, Ostiakian *kudlem*, Vogulian *kulem*, Hungarian *hall*, as compared with the Aryan *KRU KLU* (again with palatalised, not with a labialised guttural), which we find in Sanskrit *śru*, Greek *κλύω*, Lat. *cluo*, Lith. *klausau*, Ir. *clú*, Old-Slav. *slova*, Goth. *hliu-ma*, Eng. *loud*.

Before we leave the Etruscan numerals, we may repeat a question that has been asked before, "Where is the certainty that these words are numerals?" *Prima facie* evidence in favour of such a view there is; but sufficient to erect upon it a lasting edifice—No.

MAX MÜLLER.

Manual of Mythology. Greek and Roman, Norse and Old German, Hindoo and Egyptian Mythology. By Alexander S. Murray. Second Edition. (London: Asher & Co., 1874.)

THE success of the first edition of this *Manual* having shown Mr. Murray that he had supplied a real want, he has exerted himself to make his work as complete and satisfactory as its limits allow. The difficulty of composing a good elementary book—great in every subject—is heightened in the present case by the peculiar condition of the science. It would be easy but unprofitable to give a mere digest of the mythological part of Smith's Dictionaries. On the other hand, the scientific treatment of mythology is in its infancy. Much has been written, but the line which a "Manual" must recognise as separating accepted truth from more or less probable conjecture has hardly yet been drawn by any competent authority. Mr. Murray is entitled to high praise for the judgment with which he has drawn this line. He has satisfied, in a high degree, the conflicting requirements of his task—an agreeable narrative, brevity, and scientific interest.

The first object which should be before the mind of the writer of an elementary work should be to save his readers from the wearisome process of unlearning, which takes so much of the beginner's time in most historical and philological subjects. An introduction to Mythology should contain, above all, an accurate picture of the mythological notions of the ancients as they were at one or more definite periods—not, as too often has been the method, an abstract of all the notions of the centuries roughly included in the term "antiquity." The periods chosen must be those which have the best claim to the title classical—those of the most brilliant development of art and literature. The student of mythology has an interest in collecting and analysing the bewildering maze of narrative which comes from local legend, or is due to the ingenuity of compilers; the beginner, or the general reader, desires to know the conceptions which entered into the belief of Homer, or of the Attic poets, or of the Augustan age; and to know each of these, if

not profoundly, at least accurately, as they were, in and for their own time. Further, the study of Mythology should be connected, much more than has hitherto been the case, with the study of ancient Art. The religious conceptions of the Greeks were dependent, to an extent which it is difficult for us fully to appreciate, on the visible forms which Painting and Sculpture brought before them; and the most brilliant period of Greece was distinguished by an intimate harmony between the pure human ideal, which governed their conception of deity, and the technical perfection with which that ideal was represented by their great artists. Hence the illustration of mythology from the remains of ancient art is not a mere matter of ornament, but goes to the heart of the whole subject. Mr. Murray has led the way in this direction by enriching his *Manual* with forty-five well-chosen and well-executed plates, and by their help he has given his work a completeness which the study of mythology cannot attain so long as it is confined to the field of literature.

If the first duty of the student of mythology is to discover and reproduce the past from the literature and the works of art which it has left behind, there is another part of the subject too important to be omitted in the most elementary treatise—that, namely, which treats mythological beliefs as the matter of science, and enquires into their origin and the laws of their growth. Mr. Murray approaches this side of his task with evident hesitation. He had to steer his way between the alternatives, on the one hand, of plunging into a new and wide subject; on the other, of ignoring discoveries of undoubted importance. The writers whom he chiefly follows—Welcker and Preller—made many valuable suggestions towards accounting for the growth of mythology; but we look in them in vain for a consistent scientific theory. Even when they look in the right direction—that of deriving mythological conceptions from the great phenomena of nature—they leave us with a sense of incompleteness. We feel that a little ingenuity would suffice to construct several equally good explanations of the same *data*. Now it is the merit of the famous but (we fear), as yet, little understood theory of Kuhn and Max Müller, to put an end to this uncertainty, by introducing a new element into the problem. Myths are derived from the phenomena of nature, they say, not directly, not merely by the sort of unconscious allegory which earlier theories supposed, but through the influence of words. The power and scientific precision of this method consists in the order of facts with which it deals—the facts of language. The likeness of narratives to each other, and their analogies with natural phenomena, must always be full of uncertainty; but the comparison of words has proved to be a solid basis for science. Hence Comparative Mythology, so long as it is an offshoot of the Science of Language, is capable of the same *ἀκρίβεια*; when it deserts language and seeks only for resemblance in the myths of different countries, or goes directly to the "story of day and night" as the universal key, it is no longer the new science, but falls back into the slippery ground of the old guesses.

The etymological explanation is applicable not only to the names and original conception of the deities, but also in many instances to their local connection, their distinctive emblems, and the like. Mr. Murray might perhaps have brought this out more distinctly. Thus Apollo Lycius, he rightly notices, meant simply "Apollo of light," and he might have shown how this explains the notion of Apollo, *λυκοκτόνος*, "the wolf-slayer," from the accidental likeness of *λύκος* and *λύκη*. Mr. Murray is met by another instance of this kind in the connexion of Poseidon with the horse, and gives different and (as it seems to us) conflicting explanations. "The swift springing movement" of the horse "compares finely with the advance of a foaming wave of the sea" (p. 50); and again, "a district well supplied with water was favourable to pasture and the rearing of horses, and in this way the horse came to be doubly his symbol, as god of the water of the sea and on the land" (p. 52). Both these explanations can hardly be true, and in them we seem to perceive the note of indefiniteness and inconclusiveness which contrasts so markedly with truly scientific results. What is wanted is not a mere analogy, such as might furnish a conceit to a later poet, but a word which would leave a mark in popular belief.

While the character and history of each god is ultimately derived (as we hold) from the facts of nature as expressed in language, it should not be forgotten that religious conceptions are modified by civilisation and reflection, so that the later systems may stand in a much less perceptible relation to the primitive germs of a mythology. Mr. Murray has not always given sufficient importance to this point of view. For example, in enumerating the attributes of Apollo, derived from his original nature as the sun-god, he describes him "as god of oracles, which reveal the secrets of the future, as the light of heaven dispels all darkness and destests nocturnal gloom." It is very doubtful whether the notion of Apollo as the sun was sufficiently prominent in the thought of the people at the time when oracles of Apollo sprang up and multiplied in Greece. In Homer, as we noticed, there are only slight traces of the solar character of the god; and on the other hand, the oracles are of still later growth. Moreover, the oldest oracles—that of Zeus at Dodona, that of Earth at Delphi—do not belong to the worship of Apollo. It seems rather that the oracles date from a time when that worship became the vehicle of new moral and religious ideas of deep significance; when Apollo was regarded as the deliverer, the purifier, the interpreter of the will of Zeus to men, the lawgiver and orderer of cities. The Apollo of Homer is none of these things; he is not even an especially Greek deity, but has his chief seats in the Troad, and in other parts of Asia Minor. It may be true, therefore, that the sun-god became in Greece the chief giver of oracles; but we must beware of the sort of flying leap which seeks to connect the two characters by a common notion—that of light—and neglects the intervening stages of a long religious history.

The growth of myths out of words may still be traced in Greek poetry, especially in

the ancient forms of speech which are embedded in the verses of Homer. When we read of the rain of Zeus, the thunder-delighting Zeus, the cloud-gathering or the dark-clouded Zeus, we have only to put the word "sky" or "heaven" in place of Zeus to restore life and meaning to all these phrases. But Zeus has another side which this key will not fit. He is also Zeus the counsellor, Zeus of the hearth, Zeus of guests, Zeus of good faith; he is the god that answers prayer, and takes a part in human affairs. In other words, Zeus as the name of the sky has passed into, and yet is not wholly identified with, Zeus as a person. There is the same double use of the name Ares. Sometimes it must be rendered battle, or the spirit of battle; men are slain by Ares when no personal interference of the god is thought of; or Ares enters their hearts, or gives force to their weapons. In other places Ares is a god who appears himself in the fray, or leaves it again and returns to Olympus. Hephaestus is not less distinctly a personal agent in the *Iliad*; but when men roast flesh it is said that they hold it "over Hephaestus," that is, over the fire. Of these two sides of the Homeric deities it is easy to see which is the older. Language comes in here to show that Zeus originally meant "sky;" that therefore the phrases about the rain or the thunder of Zeus are the germs of the longer and more human myths. With this half-transparent mythology of Zeus may be compared the belief in the Sun and the Moon (*Ἥλιος* and *Σελήνη*) as divine beings—a belief which is common to all periods of Greece, but which gave rise to little of the nature of mythical narrative. The reason is plain: the decay or disease of language, which is the essence of mythology, did not take place: *Helios* was the sun, and all that was said of him remained clear and sound to the last. Again, we find deities whose names have lost their primitive meaning, who have therefore become purely personal agents. Apollo may be reckoned in this number; the epithets that came originally from the notion of the Sun, such as bright (*φειβο*), far-shooting, are a mere trace of the original form of the belief; while in the classical periods Apollo and *Helios* are quite distinct. Athene has lost altogether her character as a part or phenomenon of nature, and has become spiritualised as the giver of wisdom. In these and all like cases the task of comparative Mythology is to get back from the Attic or Homeric forms of the myths to simple forms of speech like "the course of *Helios*" or "the rain of Zeus;" and to do so—to repeat once more the cardinal point of the science—not by asking what natural object is like the story or the attributes of the god, but by asking what natural object is meant by the name or epithet given to the god by the tradition of his worshippers.

The difficulty just noticed in the interpretation of the functions of Apollo is but one case of a problem which meets the student throughout the subject of mythology. Admitting that the beings with whom he has to deal are the names of natural objects turned into persons, and that the actions ascribed to them are only the expression in a forgotten language of the great facts of nature, the changes of day and night, sum-

mer and winter—admitting this, we must still recognise in the form of mythology the influence of human society and morals. When the victory of the Sun over the darkness is translated into the victory of Apollo or Indra over a monster, the materials of the story—the notions of "conqueror" and "monster"—are furnished from human observation. The mythological decay of language does not create facts of human society; it only combines these facts in the form which is suggested originally by the appearances of nature. Hence, when it is asserted that the strange or revolting character of certain Greek myths follows from a "mythological necessity," and does not depend on the character or the habitual ideas of the people, the defence can only be accepted within narrow limits. It is impossible to suppose that natural phenomena could suggest quite unknown horrors, nor is it likely that they would be expressed in language which from the first suggested repulsive ideas. It is much more likely that the stories were not horrible when first told. It does not follow that they represented an early stage of custom, but only that the childish imagination of primitive men was not shocked by combinations which were shocking to a more reflective age. It is not surprising that these stories, once established, should have survived to a time which could not possibly have given them birth. Morality and reflection, like the Prayers in the ninth book of the *Iliad*, follow halting and blind to repair the mischiefs which mythology has wrought among men. As the forms of the gods were purified by the artistic sentiment of the Greeks, and freed from the fantastic or monstrous elements which are conspicuous in some Asiatic religions, so the absurdities or atrocities of their history were gradually superseded or kept out of sight. The reconciliation, however, was far less complete than in the domain of art; the "old quarrel" of mythology and philosophy subsisted in one form or another as long as the civilisation which was based upon them.

In a future edition—of which Mr. Murray deserves to have many—he should give the interesting story told by Herodotus of the introduction of the worship of Pan at Athens. It is always well to take a good opportunity of presenting mythology, like other parts of the life of nations, as a moving and growing element, and of warning beginners against regarding it as complete or fixed at one place or time. A careful examination of Mr. Murray's book would perhaps discover other opportunities of avoiding this tendency, which may be said to be the besetting sin of all systematic treatment of historical matter.

D. B. MONRO.

Electricity and Magnetism. By Fleeming Jenkin, F.R.S.S., L. & E., Professor of Engineering in the University of Edinburgh. 8vo., 379 pp. Illustrated. (London: Longmans, Green & Co., 1873.)

THE science of Electricity has of late years undergone the most profound changes at the hands of Sir William Thomson and Professor Clerk Maxwell; we may therefore reasonably expect that a text-book on the subject will

present but few points of resemblance to the text-books of even twenty years ago. The change has been produced by an extended mathematical treatment of the science, mainly by the eminent mathematicians to whom we have just alluded. The electrical measurements commenced by Coulomb have been multiplied and rendered more accurate by the invention of new instruments; and exact ideas have been obtained regarding capacities, potentials, and quantities. A science does not often receive mathematical development from the fact of its being applied to some useful purpose, yet this has been the case with electricity. The gigantic system of electric telegraphy has to a great extent given rise to the prosecution of those researches which have given us precise notions regarding many electrical phenomena which had previously been ill-understood, or altogether uncomprehended.

Professor Jenkin's work differs altogether in style and arrangement from the usual run of text-books; compared with Lardner, or Ganot, or Deschanel, or De la Rive, we see at once, although the facts may remain the same, their grouping is altogether different. The first chapter, on "Electric Quantity," describes the more obvious phenomena of attraction and repulsion, and refers them to induction; the modes of producing electricity by heat, friction, chemical action, &c., are discussed, and the important word *potential* is defined. This term, which is perpetually used nowadays by electricians, cannot, unfortunately, be defined very tersely. It means "electrical condition,"

"That which determines the direction of the transfer" (of electricity from one conductor to another) "is the relative *potential* of the two conductors."

Thus electricity must always flow from a conductor at a higher potential to one at a lower potential. The potential of the earth is zero, hence the potential of any body is the difference of its potential from that of the earth, somewhat as we might speak of the temperature of a body compared with the absolute zero of temperature. The second chapter is entirely devoted to the consideration of Potential; and previously to an extended definition we are reminded that when electricity flows from a higher to a lower potential it does work, or requires work to be done; hence the following extended definition:—

"Difference of potentials is a difference of electrical condition in virtue of which work is done by positive electricity in moving from the point at a higher potential to react at a lower potential, and it is measured by the amount of work done by the unit quantity of positive electricity when thus transferred."

For these measurements we have definite units, such as grains and feet, just as we measure ordinary mechanical work produced by gravity or otherwise by foot-pounds. Many illustrations are given of the causes which produce difference of potential, and the modes of measuring the differences. The third chapter treats of "Current Electricity." The definition is rather cumbersome, and not quite as intelligible as it ought to be, but it is made clearer by the examples which are given to illustrate it. On p. 62 we find various rules for remembering the direction

in which a given pole of a magnet is deflected by an electric current. We consider the usual example of the man swimming in and with the current, as far preferable to the others. What, for instance, can possibly be more confusing than the following attempt to fix the idea in one's mind?—

"Or, let a current be flowing through a copper cork-screw, and let the magnet take up its natural position inside the coils of wire; then if the cork-screw be turned the way of the current it will screw from south to north through the compass needle considered as a cork."

This is without exception the most ingeniously complex "ready remembrancer" we have ever seen applied to the phenomena in question. The subject of electro-dynamic induction is discussed in this chapter. The fourth chapter treats of *Resistance*, and describes Ohm's Law, without, however, formulating it very fully. Then we have an important account of electrostatic measurements; then several chapters on magnetism and magnetic measurements. The terms used to designate the various units of measurement appear unnecessarily fanciful. We do not know whether such terms are in general use among practical electricians, but we have not before seen them in a text book. We refer to such terms as *megavolt*, *megafarad*, and *megohm*. A table on p. 162 gives the value of these units in relation to Resistance, Current, Quantity, Electromotive Force, and Capacity. Interesting chapters are devoted to an account of Electrometers and Galvanometers, including those devised by Sir William Thomson. A good deal of the latter part of the book is devoted to an account of Electric Telegraphy, upon which subject Professor Jenkin is a considerable authority.

The work will be found of great use to practical electricians, and to those who have made some progress in the study of electricity, and who are working in a physical laboratory. It is, we think, too complex for a school book, and can only be used in conjunction with a more elementary work. The series of works to which this belongs was issued by Messrs. Longmans, with a view to its "general use in schools, and for the self-instruction of working men." Perhaps in countries in which education is more widely diffused and of a higher standard than in England, such a book as this could be read by working men and used in schools; but in this country we may safely assert that the book could not be used as a text book even in the highest forms in schools, and we question whether our best educated artisans could follow much of it. It is true that there is not much trigonometry in it, but portions of the subject receive very detailed mathematical treatment. The work may be useful for advanced special science classes in large schools and universities, and for students in institutions like the School of Mines. It contains a good deal of original method and arrangement, but we do not think this has always conducted to greater clearness and intelligibility. It is no doubt, however, more logical and philosophical than the majority of elementary treatises, and for the soundness of the work Professor Jenkin's name is sufficient. G. F. RODWELL.

A History of British Quadrupeds, including the Cetacea. By Thomas Bell. Second Edition. Revised by the Author, R. F. Toms, and Edward Alston. London: Van Voorst, 1874.—It is not our usual habit to notice the second editions of well-known works; but in the present instance we may be held excused, first, on the ground that thirty-seven years have passed since the first edition appeared; and, secondly, because the work has been very materially altered, and, it may be added, improved. The descriptions of the domestic animals, as those of the dog, goat, sheep, horse, ass, hog, and guinea-pig, have been omitted in the present edition, partly because these species cannot be properly regarded as belonging to our fauna; and, secondly, because the space at command was too limited to give any satisfactory account of their history and varieties. We are rather of opinion, however, that a short account should have been given of typical specimens of each of these animals. Omitting these, sixty-seven species of British mammals were treated of in the first edition; of these seven have been rejected as inaccurate, whilst, on the other hand, thirteen new species have been introduced, of which one (*Sorex pygmaeus*) is a land animal, two are seals, and the rest are all cetaceans. The accounts given seem to us well written and fairly abreast of recent works. We notice, however, some omissions. Thus the subject of the chewing of the cud by the hare, discussed some time ago by Professor Owen, is not alluded to. Again, the hair of the mole is said to lie in either direction because it is inserted perpendicularly into the skin; but Quekett long ago showed that the real reason is that each hair is composed of two parts like a flail, the outermost half adapting itself to the direction in which the animal is moving.

The work as a whole contains a fund of interesting information with which every English gentleman, whether living in town or country, should be familiar.

We need scarcely add that the drawings, as in all Mr. Van Voorst's publications, are exquisitely done, and add greatly to the value of the work.

La Fécula y las Plantas Farináceas del Nuevo Mundo. Por A. Ernst. Tomado del Almanaque para Todos para el año de 1874. Puerto-Cabello, 1873. 8vo, pp. 18.—Dr. Ernst is a hardworking German savant who has settled in Venezuela, and in this little tract has given a proof of thoroughness and industry. "Starch," he truly remarks, "merits without doubt the first place amongst the numberless useful and precious substances yielded by the vegetable kingdom for the service of man, as one of the most indispensable foods for the human body." After a concise explanation of the composition of starch and its alimentary uses, we have what the author modestly terms a brief *résumé* of the principal native and cultivated vegetables of the New World, which contain a sufficient quantity to serve as food for its inhabitants. This list contains the names of a hundred plants, many of them annotated. Large as is this list, Dr. Ernst is of opinion that many farinaceous plants have still escaped, but its extent is "a conclusive proof of the innate sagacity of man in discovering in the most heterogeneous and sometimes noxious plants the precious food that constitutes 'our daily bread,' and of which the great Florentine poet says:—

"Dà oggi a noi cotidiana manna,
Senza la qual per questo aspro deserto
A retro va, chi più di gir s'affanna."

In the New World even more than in the Old science may be of immense service to mankind by pointing out the uses and capabilities of the gifts which Nature has bestowed with so liberal a hand."

The Treasury of Languages: A Rudimentary Dictionary of Universal Philology. (Hall & Co., 1874.) The title of this book is extremely unfortunate, as it gives but a faint idea of the real nature of its contents. The work is really an alphabetic list of all the known languages and

dialects of the world, past and present, each language being classified in accordance with the conclusions of the latest researches. In all important cases the chief characteristics of the language are noted, and the best authorities upon it given. Terms like *Agglutinative* and *Inflectional* are explained, though we fail to see the propriety of introducing the *Nibelungen Lied* into such a dictionary. A short preface has been compiled from Dr. Latham on the geographical distribution of speech. The work, we have no doubt, will be useful to the linguistic student, as well as to the largely-increasing public which takes an interest in the results of scientific philology. The names of the contributors guarantee the accuracy of the book, and it is rare to find mistakes like the meaning assigned to the "root-word" of *Amharic*, which the Dean of Canterbury has unfortunately not thought himself at liberty to correct. *Amhara*, "the leaders," really comes from *mareha*, "to guide." The completeness of the Dictionary leaves nothing to be desired; indeed on this head our only complaint can be that it is unfair to insert so doubtful a term as *Palæo-Georgian*, and yet omit *Elamite* and *Susianian*.

In a letter to Professor Corazzini, originally published at Verona in the *Rivista filologico-letteraria*, and now reprinted under the title, *Di alcuni Luoghi difficili della Divina Commedia*, Signor Salomone-Marino, of Palermo, has endeavoured to show that traces of the Sicilian dialect are to be found in that poem. The argument is that Dante, as he himself tells us, laid all the dialects of Italy under contribution for his vocabulary, and thus there is an antecedent probability that he should have used the Sicilian dialect, which only requires corroboration from the poem to make it a certainty. The first passage that he adduces is that in *Inf.* v. 66, about Achilles, of whom it is said—

"Che con Amore al fine combatteo."

Here *con Amore* is usually explained as equivalent to *per Amore*, and some of the less trustworthy MSS. of the poem have introduced *per* into the text. But Signor Salomone-Marino points out that in modern Sicilian the verb *cummuttiri* (= Ital. *combattere*), signifies "to be engaged upon, occupied with, devoted to," and this meaning suits the passage better, and may also serve to explain the use of the word in *Par.* v. 84, where it is said of a lamb, that

"semplice e lascivo
Seco medesimo a suo piacer combatte."

He traces this meaning in some classical writers in the Sicilian dialect; but, though he makes out a strong case, it would certainly be stronger if he could show that it is found nearer to Dante's age, for it has somewhat the look of a late derivative meaning. Among other passages, which he discusses, is the *acqua tinta* of *Inferno*, vi. 10, where he argues (somewhat hypercritically, as it appears to us) that *tinta* cannot mean "dark," on the ground that the darkness would not be traceable in Hell, and says that it bears the Sicilian meaning of "putrid, corrupt." Similarly he points out that *dispetto*, which Dante uses for *dispetto*, and *compagna* for *compagnia*, are Sicilian forms. These discussions are valuable and interesting, and much may yet be done towards the elucidation of Dante by a careful study of the local dialects of Italy; but when Signor Salomone-Marino deduces from this an argument to corroborate those brought together by Signor L. Vigo in his *Dante e la Sicilia*, to prove that the great poet visited that island, he is standing on less safe ground. The Italian students of Dante on the Riviera, between Nice and Genoa, find various expressions used by Dante, which have become obsolete elsewhere, still existing in their local dialect; yet, though the poet was acquainted with this part of Italy, for he speaks of the Corniche route of that time—*tra Lerici e Turbia* (*Purg.* iii. 49)—it is not attempted to show that he borrowed words from the language then spoken in this district; for the more probable explanation is, that words or usages, which then

had a wider range, in the course of time, according to the analogy of what we find in other languages, became restricted to a more limited area. What is here remarked with regard to the Riviera, may also be applied to Sicily.

A Dictionary and Glossary of the Kor-ân. By John Penrice, B.A. (London: Henry S. King & Co., 1873). It is a pity that a glossary such as this, which appears to have many of the qualities which combine to form a handy help to beginners, should be marred by a suspicion of plagiarism. In the preface, the author refers to the dictionaries of Freytag and Johnson—the former teeming with egregious blunders, the latter a mere vocabulary—without mentioning his obligations to Lane's *Arabic Lexicon*, the greatest contribution to the knowledge of the Semitic East which the learned world has yet received. We would not insult Major Penrice's reason by even suggesting the possibility of his having omitted to refer to Lane's work; such an omission would have been the act of a maniac. That the publication of this great lexicon is not yet completed furnishes no excuse; for, as an eminent French savant has said, every article in Lane's *Thesaurus* (as it may well be called), is a distinct monograph, complete and precious in itself. The present incompleteness of the *Lexicon*, therefore, ought only to cause Major Penrice considerable regret at the contrast which would necessarily be presented between the first half of his *Glossary* and the second. It is difficult to discover a third course besides mania and plagiarism; but we are unwilling to push the conclusion; let us hope such a third course may be found. It must be added that some singular coincidences in quotations from the Kor-ân seem to indicate that Major Penrice may not have been altogether unacquainted with Lane's *Lexicon*. This drawback necessarily detracts from the value of the work as a trustworthy guide; yet the book is likely to answer its purpose in smoothing a beginner's road in reading the Kor-ân. EDITOR.

NOTES AND NEWS.

M. HÉBERT, the well-known Professor of Geology at the Sorbonne, and editor of the *Annales des Sciences Géologiques*, is now conducting a geological excursion to Havre, Fécamp, Etretat, and Rouen. The party started from the St. Lazare station at half-past six, on the morning of March 30, and was to return to Paris on April 4.

THE annual soirée of the Royal Society, which will be held in their new apartments at Burlington House, is fixed for Wednesday, April 22. Heretofore the invariable practice of the Society has been to hold their soirées on a Saturday.

THE Wisconsin Academy of Science, Arts, and Letters was established in 1870, and the first volume of the *Transactions*, which has lately arrived in England, contains a Report by the President on the work done in Wisconsin in different departments of science previous to the establishment of the Academy. The *Transactions* contain four papers on the Social and Political Sciences, ten on the Natural Sciences, and three on the Arts, in which last department is a paper on the Rural Population of England as classified in Domesday Book.

THE last day for receiving certificates of candidates for election into the Royal Society was Thursday the 5th ult., and the complete list now consists of fifty-two names. The day fixed for the election of the fifteen to be selected by the Council is June 4.

THE Royal Academy of Turin, which holds in Italy the same position which the French Institute holds in France, has offered a prize for the best essay on the Philosophy of Antonio Rosmini. The essays may be written in Italian, Latin, or French, and must be sent not later than December 31, 1875, to the Secretary of the Academy, Gaspare Gorresio. The successful essay will be

printed in the *Transactions* of the Academy, and the writer will receive a gold medal of the value of 2,000 lire.

WE recently mentioned (ACADEMY, No. 91, p. 125) some of the singular facts connected with the rapid spread of the parasitic fungus *Puccinia Malvacearum*. M. Durien de Maisonneuve has presented to the Linnean Society of Bordeaux a detailed account of its wanderings from its native country of Chili. It was first observed in the neighbourhood of Bordeaux in April, 1873, on *Malva sylvestris*; in August it appeared for the first time on the same plant in the botanic gardens of that town, and spread with wonderful rapidity through the whole district, extending to other plants of the same natural order, as *Althaea rosea*, *Malva nicaensis*, *arborea* and *rotundifolia*, and *Lavatera Olbia* and *mauritanica*; but singularly enough was not found on *Althaea officinalis*, the species on which Bertero discovered it in Chili. The species of the nearly related families *Sida* and *Hibiscus* remained quite exempt from the pest. In England it was detected in the summer of 1873 nearly simultaneously in many widely dispersed localities, as Exeter, Salisbury, Chichester, Shere in Surrey, Eastbourne, Pevensy, Sandown in the Isle of Wight, and Lynn. In Germany it was first discovered in October at Rastatt, but confined to *Malva sylvestris*, plants of *M. neglecta* growing close by remaining untouched, but it subsequently attacked this species as well as *Althaea rosea*.

AMONG the latest translations of English authors and publications into Dutch, we notice Bain's *Mind and Body*, by a Rotterdam physician, Tyndall's *Forms of Water*, and Darwin's *Descent of Man*. All these form the first part of a new "Scientific Library," the undertaking of a young publishing firm.

ACCORDING to the report by Dr. W. Mees, of Gröningen, on the chemical properties of the ethereal oil of the leaves of the *Eucalyptus globulus*, this Australian representative of the Myrtaceae is being extensively cultivated in the countries of Southern Europe. The Italian Government have begun to plant the tree systematically in the long-neglected and unhealthy districts surrounding the walls of Rome. The introduction of the *Eucalyptus* into Europe is the more important from the valuable properties inherent in it, which promise to render it a perfect substitute for quinine in its action on febrile conditions.

THE *Eucalyptus* has also been introduced, according to the *Nation*, into California, where, near the town of Hayward, the Surveyor-General of the state is said to have raised a plantation of 130,000 trees, some of which measure 50 feet in height and a foot in diameter. It is stated that the tree will not grow where the thermometer falls as low as 37° Fahr.

It was announced at a recent meeting of the Académie des Sciences, that the methods adopted in the department of the Hérault for flooding the vineyards with water strongly infiltrated with guano, has proved perfectly successful in destroying the Phylloxera, and arresting all traces of disease produced by its presence. It is reported that by the use of these guano floodings the most severely attacked plants have been restored to a healthy condition in a very short period, and have exhibited their normal vigour and productiveness. Various experiments are at present being tried in the department to ascertain the simplest and most efficacious method of employing the guano; and also to test the practicability of the schemes that have been proposed for destroying the insect by the abstraction of the oxygen from the surrounding medium; but this process, although it may be feasible in theory, is beset with almost insurmountable practical difficulties when it has to be applied to widely extended areas.

MR. W. J. HENWOOD's *Observations on the Detrital Tin-ore of Cornwall*, lately printed pri-

vately at Truro, contains some curious statistics of the enormous increase in the export of China stone and China clay which has taken place within the last twenty or thirty years. The manufacturers of porcelain, both on the Continent and in the United Kingdom, procure most of their material, which consists of a slightly coherent talcose granite, from Cornwall. In 1800 over eleven hundred tons of China stone, and over 1,700 tons of China clay, were exported; in 1838 these amounts had risen to over seven thousand tons of the former, and over twenty thousand tons of the latter. In 1870, 32,500 tons of China stone, and 110,520 tons of China clay were exported.

MR. F. W. H. HUGHES, C.E., contributes a valuable paper on "Coal in India" to the Records of the Geological Survey of India, in which he states that "even that land of monstrosities and natural wonders, the United States of America, can exhibit nothing to compare with the gigantic seams of the Hengir and Damudá coalfields." A table is added of areas in square miles over which coal rocks may be presumed to extend, from which it appears that in India there are 35,000, in the United States 500,000, in China 400,000, in Australia 240,000, in Russia 150,000, and in British America 18,000 square miles against the 12,000 square miles of Great Britain.

THE *Nation* states that a resolution has been passed by the House of Representatives, providing for the printing and binding of a report, by Professor Leo Lesquereux, on the Cretaceous Flora of the West. This is one of the final series of reports, made by Professor Hayden, of his geological and other explorations in the West during the past eight years; and, like the others, promises to be a very important contribution to American science. Of the same series a volume on the Extinct Vertebrata of the West, by Professor Leidy, was published some months ago, forming a well-printed quarto of about 360 pages, with 37 plates representing many species of mammals, reptiles, and fishes. Another volume is that upon the Acrididae, or destructive locusts of America, by Professor Cyrus Thomas. A volume, by Professor Cope, covering somewhat the same ground as that of Professor Leidy, is in an advanced state of preparation.

WE hear from Paris of an invention by Dr. Ozanam for photographing the beats of the heart. The apparatus by which this process is effected consists of a thin bag of india-rubber, connected with a short glass tube, into which sufficient mercury must be injected to fill the bag entirely, and to rise along part of the tube. When the bag is laid over the heart, each cardiac pulsation will be indicated by a corresponding movement of the mercury in the tube, and by the aid of a suitable photographic apparatus, provided with moveable slips of sensitive paper, the number, regularity, and force of the pulsations may be registered with perfect accuracy.

IN *Iron* we read that the encouragement given to ingenuity in the United States by the issue of cheap patents is so great, that invention proceeds at the rate of 20,000 new combinations *per annum*. A happy time may arrive when all the mechanical permutations have been used up, and invention, like history, will have to repeat itself or cease to exist.

SIR WILLIAM THOMSON stated recently to the Royal Society of Edinburgh that the needles of mariner's compasses, as at present employed, are much too large. To obviate the deviation in iron-clad ships, a cylinder of iron placed on either side of the compass, and parallel to the needle, has been proposed. Sir William suggests a needle of one-fourteenth of the length of that in the Admiralty compass now in use.

Iron gives the following account of the smallest engine in the world, which is now in the possession of Mr. John Penn, of Greenwich. It will stand on a threepenny-piece, as its base-plate

measures only three-eighths of an inch by three-tenths. Some of the parts are so small that it requires a magnifying glass to see their form; the whole weight of the model is less than a three-penny-piece. It works admirably up to twenty or thirty thousand revolutions per minute.

In spite of the panegyrics that have been bestowed on our alphabet, our twenty-five letters fail altogether when they have to be employed to express the sounds of so-called barbarous languages. Even when used for writing English, French, or German, they can do no more, and are not intended to do more, than indicate the real sound. If we want to photograph living language, we must have recourse to such contrivances as Mr. Bell's *Visible Speech*, and even that fails when we have to deal with the infinitesimal varieties of local, family, and individual pronunciation. But there is another curious fact, viz., that our signs for vowels and consonants are perfectly useless for writing the words of such primitive languages as Chinese or Egyptian, because in those languages the mere representation of the sound of words is insufficient. In them hieroglyphic or ideographic writing is not an accident, but a necessity. Between ideographic and purely phonetic writing, syllabic alphabets occupy a middle position, alphabets that do not employ separate sounds for vowels and consonants, but use signs which express vowels and consonants together. They have signs for ba, bi, bu, not for b, a, i, and u. These alphabets, too, find their justification in the nature of the so-called agglutinative languages, and it is very strange that not only an African tribe, speaking the Vei language at Great Cape Mount, Western Africa, having been taught the Arabic letters, but American tribes also, after becoming acquainted with our letters, deliberately discarded them, and invented a syllabic alphabet, as more expeditious; in fact, as more adequate to the wants of their language. The Bishop of Rupert's Land, in his evidence before the House of Commons' Committee on the Hudson's Bay Company (1857, p. 236), when speaking of the Crees, said: "They are chiefly taught on this system. . . what we call the syllabic character. On this plan they can learn sufficient to go away and read their little books for the winter." The whole Bible has been printed in this character in the Cree language by the British and Foreign Bible Society. There is a *Dictionary of the Cree Language*, by the Rev. E. A. Watkins.

It is now urged by some Missionaries, who have long worked among the Ojibwas, and who have prepared a revised translation of the New Testament in the Ojibwa language, that their translation, in order to make it more generally useful, should likewise be printed in a syllabic alphabet. Certainly the spelling of Ojibwa words with our letters is most perplexing. The name of the Supreme Being is spelled *Keche Munedoo, Gitche Manitou, and Kijimanito*; the Spirit is *Ojehog and Ojijag*; a ruler, *Haukimah, Oyamu, and Ogemacu*. If these perplexities can be avoided by the use of syllabic character, and, still more, if the Ojibwas can really learn the few syllabic signs that are wanted for writing their dialect more quickly than our alphabet, the Missionary Societies will no doubt attend to these arguments, and have the new revised translation of the New Testament, the work of the Rev. A. F. O'Meara, D.D., of Port Hope, Canada, printed in that form in which it will prove most extensively useful.

M. E. DESJARDINS has an interesting article, in the *Revue des Deux Mondes* for March 15, on the discoveries of French Egyptology, as represented in the labours of M. Mariette. The earlier part of the career of this distinguished savant was a long and arduous struggle against difficulties which would have crushed the energies of most other men. Born at Boulogne in 1821, he devoted the spare time that he could snatch from the employments of a schoolmaster to the study of the hieroglyphic inscriptions. In 1850 he was sent

to Egypt to procure certain MSS., supposed to be possessed by the Coptic convents there; but the sight of two or three strange sphinxes in the pleasure-gardens of Count Zizania at Alexandria, and some French friends at Cairo, induced him to turn aside from the object of his mission, and use the money at his disposal in excavating the sandy wastes of Sakkarah, from which the sphinxes had been brought. Sakkarah stands on the left bank of the Nile, and formed part of the great necropolis of ancient Memphis. A happy intuition told M. Mariette that here must lie buried the Serapeum, the sepulchre of the sacred bulls, and the key of Egyptian chronology. He at once set to work and unearthed sphinx after sphinx in a never-ending avenue which once led up to the vast building where rested the bones of Apis, from the days of Ramses the Great down to the age of the Ptolemies. After numberless disappointments and anxieties, ophthalmia and robbery, secret and open opposition, want of money, and forcible suspension of his labours, the great work was accomplished, the Serapeum was opened, and its treasures sent to Paris, while a grant from the French Government and a new Viceroy changed the explorer from a barely-tolerated foreigner into a guest of the Khedive's court. The exploration of the Serapeum has been followed by that of other sites, the results of which have created a revolution in Egyptian archaeology. The two most important discoveries, perhaps, have been that of a pre-historic temple at the foot of the great sphinx, old even in the time of the pyramids, and mounting back beyond the foundation of the monarchy, and that of Tanis or Avaris, the capital of the shepherd kings, and almost the sole existing monument of their domination. M. Desjardins concludes his article with a sketch of the religious system of the ancient Egyptians, as M. Mariette's discoveries have revealed it to us. It is founded on a pantheism of nature. The various gods were either local deities or personifications of natural things. The universe itself was the Supreme Being, which might be regarded either in its totality or in its multifarious manifestations. Everything is born to die and dies to live, and in this pantheism, as M. Desjardins observes, consisted the monotheism of the early population of the Nile valley. It is to be wished that the somewhat vain-glorious patriotism of the article had been rather less obtrusive, although its subject may perhaps be pleaded in justification.

On March 26 died at Filehne, at the age of 84, Dr. Lazarus, father of the distinguished Professor Lazarus, and himself a man of great learning, and known as one of the best Talmudists and Hebraists of his time.

MEETINGS OF SOCIETIES.

ROYAL INSTITUTION (Thursday, March 26th).

ONE of the most important objects of the *Challenger* expedition being an exact determination of the temperature of the different strata of water filling the great ocean, and this determination having now been completed as regards the North and South Atlantic Oceans, Dr. Carpenter gave a general statement of its results.

The series of investigations carried on by Dr. Carpenter in 1868, and three following years, had led him to the following conclusions, in opposition to the theory of a uniform deep-sea temperature of 39° F.

1. That there is a *general interchange* of water between the polar and equatorial areas, wherever permitted by the disposition of the land; the whole of the deeper stratum moving slowly from each pole towards the equator, and the superficial stratum moving slowly from the equator towards either pole. This double movement is sustained by the constant excess in weight of the polar column above that of the equatorial column.

2. That the temperature of the deeper parts of the North Atlantic basin progressively falls from 40°

at about 900 fathoms, to 35½° to 36½° Fahr. at the bottom; so that the whole of the lower stratum, often exceeding 2,000 fathoms in thickness, consists of water which has either itself come from the Arctic basin, or has been cooled down by a large admixture of Arctic water.

3. That the temperature of the deeper stratum of the South Atlantic would be lower than that of the corresponding stratum in the North Atlantic, on account of its much freer communication with the (South) polar basin; and that the influence of the Antarctic flow might probably extend to the north of the equator.

4. That in consequence of the meeting of the two polar underflows in the equatorial area, and the continual draughting off of the warm upper stratum towards either pole, the cold stratum would rise nearer the surface in the equatorial than in the temperate parts of either ocean.

Dr. Carpenter had further maintained that the amelioration of the climate of the western side of the British Isles, of the Orkney, Shetland, and Faroe Islands; of Iceland, Norway, and Spitzbergen, is due to this slow polar indraught, acting on a stratum of water which, even as far north as the Faroe Islands, has a thickness of several hundred fathoms, and that this could not be rightly attributed to the influence of the Gulf Stream (restricting that term to the proper Florida current), which dies out after passing the banks of Newfoundland, where it meets the arctic current. All these views had been confirmed by the *Challenger* investigations.

ANTIQUARIES (Thursday, March 26th).

MR. FRESHFIELD read a paper on the history of the parishes of St. Christopher le Stocks, St. Margaret Lothbury, and St. Bartholomew the Little, the materials for which were derived from the vestry minute books, churchwardens' accounts, and registers. These books, which were laid on the table for the inspection of the fellows, mostly range from the year 1558 to the middle of the eighteenth century. Many of them were in very ruinous condition, but have been skilfully repaired. Mr. Freshfield illustrated his remarks by many extracts from these records, of which the following facts are specimens. The lists of vestments in the church of St. Christopher (the site of the Bank of England) include a full suit for the use of the boy bishop; and copes, tunics, and other "popish" garments evidently remained in use till the fourth year of Queen Elizabeth, when they were discarded merely from the fact of their being worn out. In 1488 twelve tables were hung up in the same church, having written on them the ten commandments, and prayers to the Virgin, St. Christopher, and other saints. At the Reformation the tables containing these prayers were taken down, but the ten commandments remained. In 1521 and 1523 daily mass was said at 7 a.m. in winter, and 6 a.m. in summer; but two masses were not allowed to be said at the same time. In St. Bartholomew's it seems that daily prayer was said at a still earlier hour, at 5 a.m., as late as 1582. In fact, in some churches the bells are rung to this day at that hour, though there has been no early service for two centuries. The Free Church Association will not be pleased to hear that pew rents were exacted as long ago as 1543 at St. Christopher's, under penalty of open admonition in the vestry, and a lawsuit in case of repeated refusals to pay.

In one parish with a population of 600, ninety-two persons died during the great plague, but notwithstanding the danger of infection, and the royal injunctions to the contrary, persons dying of that disease were continually buried, not only in the churchyard, but even in the church itself, probably for the sake of obtaining the burial fees. The churchwardens' accounts of St. Bartholomew's contain a curious story of two poor Turks who received charity from the clergyman on the plea of their conversion to Christianity; but subsequently it was discovered that they were Greeks

and consequently had always been Christians, and so the churchwardens disallowed the clergyman's expenditure on them. The minute books of St. Margaret's give the details of repeated disputes between the clergy and the parishioners, who complain of the parson's absence, while the parson demands higher pay. Great credit is due to the churchwardens and others who have interested themselves in the preservation of these records, and it is much to be lamented that such conduct is not more common.

The Rev. W. H. Egerton presented to the Society a plaster cast of the skull of John Talbot, Earl of Shrewsbury, who was killed in the attempt to relieve Chatillon in 1453, and whose grave at Whitechurch has recently been opened. Canon Robertson presented to the Society photographs of the two sides of a charter of Eadred, granting Reculver to the priory of Christ Church, Canterbury. This charter professes to be written by Dunstan "propris digitorum articulis," and was itself exhibited at the last meeting of the Society.

FINE ART.

The Archaeology of Rome. (Vol. I., Parts I. and II.) By John Henry Parker, C.B. (Oxford: J. Parker & Co.; London: J. Murray.)

THE first instalment of the long-promised work by Mr. J. H. Parker on the *Archaeology of Rome*—one volume in two parts, the second consisting of photographic plates with explanatory text—must be hailed with the highest satisfaction as, from the strictly archaeological point of view, the most important contribution hitherto supplied by any one writer to that immense body of literature illustrative of the same ever-attractive subject. We have here the result of study and research energetically and conscientiously pursued during many years, and not unfrequently associated with works of excavation *in situ*, of which the learned writer was himself both superintendent and originator. In these pages we find also gratifying proof of the new advantages secured for the future student of classic monuments, thanks to the liberal principles and vigorous action of the new Government, in that city rescued from sacerdotal despotism, and raised to due rank as capital of the United Italian kingdom. Through better organisation and more consistent ordering of the *scavi* set on foot by that Government than in the case of such works as were carried out by pontifical employés, Roman antiquity has been brought into such light, and its accessible wealth so augmented within the last three years, that the inquirer may now grasp and apprehend to a degree impossible in the days when Graevius and Gronovius, or when (in much later times), Canina, Gell, Nibby, Platner, and Bunsen were compiling volumes on the same inexhaustible theme. Mr. Parker, who was a principal founder of the British Archaeological Society at Rome before the late political changes, and has directed all works undertaken by that society for antiquarian research since its origin, will beyond doubt be henceforth cited among authorities as one who has created a new epoch for the activities directed to the estimation and illustration of monumental Rome. Unlike others (of the old school) who have preceded him in this oft-resumed task, he has not contented himself with laying

down theories respecting the character and origin of classic ruins in the retirement of his study, but has arrived at his conclusions through careful observation, critical comparison, and sifting of evidence from analogies; those conclusions in many instances differing from what his predecessors adopted, and sometimes overthrowing (more or less absolutely) the fabric of traditions long admitted by *savants* and copied into guide-books. Throughout these volumes he insists, and with just emphasis, on the importance of the evidence afforded by construction, which enables the experienced to determine from ruinous stonework or crumbling masonry the approximate date of an ancient building, as the geologist may determine from scientific observation the periods to which the stratifications of our habitable globe are severally referable. In this line of argument Mr. Parker has, I believe, accomplished more than any other writer for elucidating the sphere of antiquities contemplated in his volumes. Adopting the method of his predecessors, Rickman and Willis, he acknowledges his obligations to them with candour, observing that:—

"The chronological succession of the construction of walls, and the architectural details connected with them, form the foundations of the modern science of archaeology, the system of Rickman (who was the first to reduce chaos into order) as perfected by Professor Willis."

He also supplies a complete catena of other evidences, the testimony of eye-witnesses to the condition of Rome's monuments in successive ages, from Varro and Livy to the mediaeval chroniclers and Italian *cinquecentisti*; and the many vicissitudes through which the "Eternal City" has passed, so far as events have affected its classic monuments, are here presented to us in an interesting and highly instructive abstract. Space would fail me for the attempt to follow out all the investigations reported, or to gauge the value of all the arguments advanced in this double volume of a work destined for much larger development; the contents of Part I. being divided into three chapters, each in several sections and with ample appendices:—"The Primitive Fortifications," "The Walls and Gates," "The Modes of Construction employed in ancient Roman Buildings," &c. Especial importance and an interest likely to attract all readers distinguish the section relating to the Mamertine Prisons, and describing the manner in which the writer himself accomplished the discovery of five additional chambers (all subterranean), unquestionably belonging to the same antique prisons as the two consecrated dungeons below the church of *S. Giuseppe* on the Forum, where legend states that St. Peter and St. Paul were confined during the last period of their lives. Below a massive elevation in lithoid tufa, crossed at intervals by wide constructive arches, at the eastern slope of the Capitoline hill—ruins which Canina and others after him set down as the Forum of Julius Caesar—Mr. Parker entered and explored those mysterious chambers, in great part filled with soil and débris, not, indeed, all unexplored previously, but by some identified, as (quite convincingly) by him in their connection with the long known and

devoutly visited "Prison of S. Peter."* The stone masonry in which those other prisons are built is similar, though the vaulted roofs are of brick, referable to the Imperial period, each chamber being forty feet in length and fourteen in width. A long, low, narrow passage, turned into a drain by the blocking up of an old drain under it, built in stonework of Etruscan character, and with a semi-hexagonal vaulting, leads from these dismal and long-forgotten prison-rooms to the lower of the dungeons under *S. Giuseppe*, where it ends at an iron door, never (perhaps for ages) turned on its rusty hinges till Mr. Parker effected his object after vain endeavours in 1865 and the year following, thus completing the discovery which he felt assured would ultimately reward him. It is probable that the passage was used for dragging out the bodies of those put to death in the prisons, and thence to be thrown into the Tiber. Thus is explained away (thanks to Mr. Parker's researches) the difficulty of admitting a literal sense in the line of Juvenal—

"Viderunt uno contentam carcere Roman."

Another interesting discovery, made also by Mr. Parker in 1866, is here reported: while exploring along the steep right bank of the Tiber, at a point within the Transiberine quarter of the city, he suddenly came upon three immense stone corbels, carved into gigantic lions' heads, each about three feet square, the two outer ones pierced with wide cavities, the central one indented on each side, but not bored through; the rude style of sculpture (as to which I can corroborate from memory Mr. Parker's statement) being antique Etruscan. These corbels probably served for fastening the chains thrown across the entrance to the Tiber Port at the northern boundary of the city; and we may suppose that poles were extended between them for other chains, to which barges were fastened by cables when at anchor in the often rapidly flowing stream.

Not less interesting in a different sphere is the other treasure-trove due also to this energetic explorer—a Madonna picture, which he refers to some Greek painter of the sixth century, over one of the arches of an arcade-gallery, carried along the inner side of the walls of Aurelian for the use of the sentry or soldiers engaged in defending those fortifications. Mr. Parker supposes this picture, which is not far from the Appian Gate, to have adorned an oratory here fitted up for the soldiers of Belisarius during the Gothic war and sieges. If so ancient, it must (I should say) have been entirely retouched a few centuries later. Countenance and sentiment are pleasing, but not beautiful.

Among other notices of antiquity brought to light at comparatively recent date, I may mention the section drawn up with accuracy and critical discernment, descriptive of the

* Long before the explorations successfully undertaken by Mr. Parker, I had descended into the outermost of these dark chambers and observed the antique character of the building, without being able to penetrate further. That chamber was then used as a safe for butcher's meat.

numerous buildings of different character, walls and towers, in the fortifications ascribable to the kings, constructions of Julius Caesar, and others referable to periods under the Empire, discovered, in a strangely confused aggregate, under the church of S. Anastasius near the north-western angle of the Palatine hill. All these antiquities are now subterranean and for the most part wrapt in profound darkness.

The fully worked up history of the Roman fortifications, commenced in a long "Introduction," and completed in the section "Walls and Gates," exemplifies Mr. Parker's power of exhaustive treatment, and thorough mastery of his subject. He clearly establishes, as I believe no other writer had done before him, the fact that the ancient city had not only those walls of the kings which became useless long before the Augustan age, but another system of defences, *moenia*, consisting more of earthworks than masonry, of which Aurelian availed himself for a much wider cincture, restored (perhaps amplified) by Honorius, and which (commonly called the "Honorian walls") formed the defences of Rome throughout the Middle Ages, as under the later emperors, and till the present day. A difficult and disputed passage in Vopiscus (*in Aureliano*, c. xxxix.), usually read: "He so enlarged the walls of the city of Rome that their circumference contained nearly fifty miles (*quingenta prope millia murorum*"), may be strictly reconciled with realities by reading after "*murorum*" *pedum*, i.e. "50,000 feet." Mr. Parker shows that the measurement of Aurelian's walls, including those now totally destroyed along the eastern bank of the Tiber, is exactly 50,300 feet. He also proves—and we must be grateful to him for the satisfactory solution of a problem in this instance—the correctness of Pliny's statement (*H. N.* l. iii. c. 9) respecting the sum of distances from the "*milliarium aureum*" on the Forum to the several gates opening in the cincture of Rome's walls as extant in the first century of our era. Pliny makes the amount 30,765 *passus* (the pace of 4 feet 10½ inches English); and this approximately corresponds to the aggregate of distances from the same centre to the actual gates in the walls still erect, as Mr. Parker has taken pains precisely to ascertain—i.e. 30,140 *passus*.

One may demur to admitting this writer's theory that the beautiful ruins, partly hidden (till a recent improvement was carried out) by the front of a small church, and known as the Portico of Octavia, are in fact no portico, but the triumphal gate through which victorious leaders entered the city for the celebration of public triumphs—according to Mr. Parker, no other than "the Porta Triumphalis, now the portico of the church of S. Angelo in Pescheria." I may point out disapprovingly the novel interpretation of the term *pomoerium* (from *post-murum*, according to classic authorities), as derived from *pomarium*, an "orchard," and consequently meaning, when applied to the sacred space that could not be built over, along the line of the urban walls, "trenches," from earliest time (Mr. Parker assumes) "so called probably because they were chiefly orchards." One may regret that a writer with such claims to our consideration and

reliance should utterly ignore the conclusions of Niebuhr, and indeed of many earlier writers, Vico among the Italians, who have shown the fallacy of the old traditions about Romulus and Numa, &c. Why should Mr. Parker, so well qualified to judge and decide within his special sphere, go out of his way in the attempt to establish that the internal proofs of high antiquity in Rome's classical ruins should also be admitted as proofs of an historic element in the tissue of her popular legends, which, as embodying patriotic feelings and idealising half-imaginary personages, may still be listened to with pleasure, but certainly no more accepted, after all that thought and research have achieved for the elucidating of the past and evolving of truth out of fiction, as veracious history?

The extraordinary differences of level in the soil on which stand the ancient and the modern buildings of Rome, form one of the problems that have long occupied, indeed baffled, archaeologists. Mr. Parker advances the broad and general theory, which has at least the merit of being original, that the antique edifices, whose ruins now rise before us as if standing at the bottom of pits, or partly buried in earth more or less cleared away around them, were built in the deep hollows, moats or fosses, originally formed for defence either of the Romulean city, or others of pre-historic origin, occupying heights now comprised among the classic Seven Hills. In certain instances we may suppose this to have been the case, but the application of such a theory to the extent which Mr. Parker seems to assert for it, is (I cannot but believe) utterly inadmissible, deficient in historic proof, and inconsistent with realities before us at the present day. It cannot apply to the aggregate of ruins on the Forum Romanum, nor to those (almost lost, save one great exception) on the Forum of Trajan, or to the now entirely invisible and buried remnants of the theatre, temple, portico, and curia founded by Pompeius.

Those who have known and studied the scenes and objects described in these pages will find genuine pleasure in accompanying Mr. Parker, in thought and memory, over the enchanted ground on which light is thrown by the erudition and widely-comprehensive knowledge of the Past which flow from his well-stored mind. To myself the enjoyment in the work before me is so great, that it is but little diminished by the circumstance of inability to agree with certain of his conclusions. I cannot, for instance, believe that the subterranean chambers built in ancient brickwork, and through which flows a clear spring, near the northern declivities of the Palatine, reopened a few years ago (also for the first time critically described by Mr. Parker), can indeed be, as he assumes, either the cavern of the Lupercal metamorphosed by structures of the Imperial period, or the site where, as he supposes, the underground altar to Consus was erected from earliest time. The depth under the level, not only of the declivities, but even the basement of the Palatine, on the slope of which hill that cavern is said to have opened, and the absence of all characteristics likely to distinguish a scene appropriated to sacred festivities in those

dark and narrow (though lofty) chambers, seem to me irreconcilable with such notions respecting their origin. Nor can I believe that the ruined mansion with several halls and corridors, and a marble-paved hypæthral court, on which open three chambers adorned with exquisite wall-paintings (the finest hitherto discovered among relics of such antique art at Rome)—these ruins being situated on the north-western terrace-height of the Palatine—can be (as Mr. Parker argues) the palace of Augustus. We know that the residence (formerly that of Hortensius) in which that emperor spent the earlier period of his reign, and where he is said to have slept in the same chamber during forty years, was simple and modest, suited to the habits of a private citizen. But that mansion, as rebuilt after a fire by the Senate and people, as its halls expanded around the Imperial master in his later years, became a very different, and was necessarily a spacious residence, seeing that, in his capacity of Pontifex Maximus, he had to receive under its roofs on stated days the full sacerdotal colleges. On the same premises the master of the Roman world founded the Palatine library, a temple of Vesta, and the superb fane of the Palatine Apollo, containing a veritable museum of Greek sculpture, and surrounded by the pillared portico of a sacred enclosure or peribolus. Find the ruins of the Augustan Palace, and we may reasonably look for those adjacent to it—if they exist, assuredly never extensive or conspicuous—of the library, the Vesta temple, and, above all, the glorious fane dedicated to the Sun-god.

Undertaking to criticise, I am sorry to have to point out palpable errors which may, however, be corrected in future editions of Mr. Parker's work. I allude to an occasional carelessness and looseness in quoting classic writers, and an arbitrary wresting of their meaning into apparent accordance with the writer's views. We have to thank him for an erudite and exhaustive account of the history, character, uses, and extant remains of an imposing edifice, one of the oldest and most noteworthy, but hitherto least known or explored, among Roman antiquities: the Tabularium on the Capitol, now open to the public, and in part appropriated as a museum for fragmentary remains of classic architecture. This is fully described in the text, and admirably illustrated in the photographic plates before me. Mr. Parker assumes that, besides the uses of a Record Office and Treasury (*aerarium*), it also served as a Curia or Senate House; that in one of its largest halls on an upper storey the Conscript Fathers met for their discussions. The exact site of the Curia Hostilia, which was burnt down at the tumultuous funeral of Clodius, b.c. 51, is unknown, though supposed to have been on the Forum, where certainly stood the later Curia, commenced by Julius Caesar and finished by Augustus, who dedicated it to the "Divus Julius" himself. Its interior was adorned with paintings by Greek masters; its vestibule was consecrated to Minerva, being, indeed, a "templum," where stood the altar and image of Victory, to which every senator offered incense before passing into the august assembly.

Ruins of this, in the finest brickwork, with constructive arches, and of considerable extent, are recognised by other archaeologists (opposed to Mr. Parker) below the south-eastern angle of the Palatine, and in the rear of the graceful columns pertaining to the Dioscuri temple. That later curia is said to have been restored by Diocletian after a destructive fire occurring in the reign of Carinus, A.D. 283.

"That the senaculum, or senate-house" (Mr. Parker states, quoting from classic authority) "was in part of this great public building (the Tabularium), is evident from the following passage in *Livy*, in the year 578 of Rome, B.C. 175: 'The censors paved the Clivus of the Capitol (from the Forum) and the arcade (*porticus*) from the temple of Saturn, and the senate-house in the Capitol, and the court above it.'"

Let us turn to the original of this passage in the historian (l. xli. c. 26), after citing which I need not add one word of comment, either on Mr. Parker's version or on the deduction thence drawn by him:—"Censores—clivum Capitolinum silice sternendum curaverunt, et porticum ab aede Saturni in Capitolium ad coenaculum, ac super id curiam—lapide straverunt."

Again, referring to the origin of that structure, still majestic in decay, on the Capitoline Hill, Mr. Parker states:—

"This (the Tabularium) is the identical building mentioned by Terentius Varro as considered in his time to be one of the three buildings that remained of the original city or *arx* of the Sabines, before the union with the Romans; "

also to the same reference, elsewhere (v. descriptive text to plate VII., "Capitolium"):—

"this (the Temple of Concord), with the Temple of Saturn, as it then stood, and the Tabularium, form the three buildings which Terentius Varro states were in his time considered to have belonged to the city of the Sabines, which show that they were of very early and rude construction."

Let us consult the original passage in Varro (*De Lingua Latina*, l. v.), obscure and confused as it certainly is, on which Mr. Parker founds the theory he seems to consider inassailable:—

"Hunc antea montem Saturniam appellatum est ab eo late Saturniam terram, ut etiam Ennius appellat: antiquum oppidum in hac fuisse Saturnia scribitur. Ejus vestigia etiam nunc manent tria, quod Saturni fanum in faucibus, quod Saturnia porta quam Junius scribit ibi, quam nunc vocant Pandanam, quod post aedem Saturni in aedificiorum legibus privatis parietes Postici Muri sunt scripti."

One may alike object to the manner in which that same building, the Tabularium, is throughout assumed to be the "Capitolium" in ancient use, and so styled in ancient parlance. The term is, in fact, most vaguely employed by Latin writers, sometimes as implying the Tarpeian ark, sometimes the entire Capitoline hill, but more frequently, and I believe definitively, as designating the great temple of Jupiter on that height. Thus in the very passage Mr. Parker gives from Tacitus, descriptive of the attack on the Tabularium, the struggle between the troops of Vitellius and Vespasian, the effects of the fire then kindled, either by the besieged or the assailants, are dwelt on with eloquent regret by the historian, seeing that they led to the total ruin of Rome's most sacred, famous, and

revered sanctuary—the "Capitolium:" i.e. the temple of the supreme Jove.

Still more objectionable is the sense here put on a passage from Dion Cassius, in the argument Mr. Parker sustains for supporting his theory as to the house of Augustus and the above-mentioned ruins on the Palatine, where he believes that it should be located. The translation here given is the following:—

"The people planted laurels before his house on the Palatine; they called his house a palace, and decreed that the Caesar should always live on the Palatine, and that he dwell in the Praetorium (that is the *arx*, citadel, or keep), which he chose out of all the hills because Romulus lived there. He accepted some splendour, because it was right that the Emperor should inhabit such a house as would deserve the name of a palace."

Besides the arbitrary rendering in a parenthesis, not distinguishable from the translated text, of Praetorium as "*arx*, citadel," &c. (the original being *στρατήγιον*, and Praetorium, according to lexicographers, signifying the house of a governor—a general's tent—any princely mansion—in the Latin Vulgate the judgment-hall of Pontius Pilate), there are so many defects in this version that one must refer to the original Greek for correcting all, and for ascertaining, as seems to me apparent, that not one of the points insisted on by Mr. Parker, as bearing on his subject and supporting his argument, is contained in Dion's words. I crave, therefore, the insertion of the passage beginning, as above, "they called his house," &c., in that original, leaving the reader to judge for himself:—

Καλεῖται δὲ τὰ βασιλῆα πύλατιον, οὐχ ὅτι καὶ ἔδοξε ποτε οὕτως αὐτὰ ὀνομάζεσθαι, ἀλλ' ὅτι ἐν τῇ παλατίῳ ὁ Καῖσαρ ῥέει, καὶ ἐκτὶ τὸ στρατήγιον εἶχε, καὶ τινα καὶ πρὸς τὴν τοῦ Ῥωμύλου προνοίκεισιν φήμην ἢ οἰκία αὐτοῦ ἀπὸ τοῦ παντὸς ὄρους ἔλαβεν. καὶ διὰ τοῦτο κῆν ἀλλοθὶ πονὸς αὐτοκράτωρ καταλύει, τὴν τοῦ πύλατιον ἐπέκλησιν ἢ καταγωγὴν αὐτοῦ ἴσχει (l. i. iii. 16).

The above is rendered into the following somewhat quaint English by Manning ("*History of Dion Cassius*, abridged by Xiphilin"):—

"Now the Emperor's house is called the palace, not that it had the name by virtue of any decree, but because Caesar established his residence at the palace, or place where the courts of justice were held. For the house of Romulus was called palace, because the place where it was built was called so before; but since, though the Emperor removes his dwelling, wherever he lives his house is called the Palace." (*)

I discharge a painful duty in pointing out errors that detract from the value of an otherwise most valuable work. They are fortunately remediable, and, though blemishes, do not neutralise the charm which must be felt by earnest students in this production of an earnest mind—stamped, as I may say it is on every page, with the impress of a vigorous intellect and manly enthusiasm, devoting large capacities and means with unwearied ardour to an intellectual interest, an elevated, indeed elevating pursuit.

A word more as to the plates accompanying the present, and to accompany the

* I need not point out the imperfections of this version, but is it not more faithful than that given above, notwithstanding the curious confounding of "Palatine," the name of the hill, with the conventional term for an imperial residence?

forthcoming volumes: they promise, in the complete series, to supply the fullest, most accurate and trustworthy pictorial presentment of Roman antiquities yet compiled or made public. As to literary style and colouring, &c., they are in every respect suitable to the themes here treated—terse and lucid, spontaneous and unaffected. Without studying the picturesque, or ever allowing to himself the emotional, Mr. Parker writes like one who, absorbed in his subject, forgets himself whilst rising superior to the littleness of straining after effect, and therefore taking the stronger hold on his reader's attention. C. I. HEMANS.

PICTURES OF THE CONTINENTAL SCHOOLS AT THE FRENCH GALLERY.

THIS is the twenty-first return of the eclectic little show which, among Englishmen unacquainted with the main currents of Continental art, has always enjoyed a reputation somewhat above its deserts, but which nevertheless always contains some elements of interest. One or two Meissonniers in places of honour, one or two Gérômes, one or two Frères—these have consistently been the staple attractions of the Spring exhibitions in Pall Mall; and, subordinate to these, we have been accustomed to find specimens of the pastoral school of Breton, interspersed among specimens of the boudoir school of Stevens and of the half-domestic, half-academic, wholly false school of Merle and Bouguereau, and among landscapes representing generally the second-rate rather than the first-rate contemporary hands of France. Then, after the Frenchmen (among whom, as more Parisian than the Parisians, I count Stevens), we have been made familiar with some of the most prominent living names of Belgium and Holland—with Gallait in history, Israëls in peasant subjects, Bisschop and others in portrait, Clays and Mesdag in landscape; with *genre* painters either rising or risen of Germany, Spain, and Italy; and occasionally with an example from the outlying schools of Scandinavia, Russia, or Hungary.

This year it is much the same tale as usual. Among the Frenchmen Frère is wanting, and there are not so many examples as usual of others who work his vein,—M. Ch. Moreau, not one of the most refined of these exponents of humble life and cottage sentiment, standing indeed in comparative isolation with his *Granny's Pet* (7). But the exhibition does not want its Meissonniers; of which one, *The Guard Room* (63), differs little from other animated and costumed soldier-scenes by the same master in the same vein; but the other, *The Sign-Painter* (60), is more noteworthy. The sign is Bacchus astride of his vat; the painter working at it in the inn-yard is a jovial itinerant, wearing the breeches, gaiters, and three-cornered hat of the last century, and for the rest stripped to his shirt-sleeves; he turns to laugh over his own workmanship with a guest of the house, who swaggers and plays the critic with a half-drunk supercilious gravity. The piece is somewhat above the usual dimensions of a Meissonnier; but into the most sparkling of his miniature work he never put more minute expressiveness of design and humorous gesture. The weakened eyes and flushed faces of the dissipated pair are carried as far as realism can carry them; but everything else is carried so far too, and there is so much character in the attitudes and in every crease of the clothes, and so pleasant a harmony in the colouring, that nothing obtrudes itself or displeases. Indeed, I do not know any colouring of this artist happier than that of the woodwork, tiles and shutters, the odd casks and hoops of the inn-yard—warm browns and russets rising to a climax in the bacchic roses of the painted god, and of the countenances of his painter

and critic. The indispensable Gérôme is represented by one of his most careful Oriental pieces, the small picture of *Botzaris* (44). The warrior is seated on an inlaid throne before a recess panelled with Persian tiles; the head is powerful enough in design and expression; but the point of the piece lies in the stuffs and accessories, the background of blue and white tiles, the crimson drapery of the figure and the rugs at his feet. What is the peculiar quality of austerity, of joylessness, in M. Gérôme's art, which makes it disagreeable to look at, even when it represents the most brilliant objects, and represents them, as here, with a commanding justice and an undeniable subtlety of colour and tone? The contradiction, the cold effect, cannot be merely due to thinness and hardness of surface; it is something which I have always found as hard to explain as to escape. Passing to the pastoral school, we find M. Jules Breton in his new manner, which, in the endeavour to be something better than the old, seems to me to be something not so good. The style, the pathos, which gave distinction to his figures of labouring women and children in pictures of the class of the well-known *Gleaners*, the gentle harmony that subsisted between the colour of his figures and of his landscape, these are gone in work he has lately done on a larger scale and on principles of firmer realisation. The *Breton Peasant Woman* of last year's Salon (No. 139 in the exhibition under notice) shows a careful study of an interesting model, with much character delicately expressed in the eyes and mouth; but in the treatment of her dress with its cold browns, and the filling in of the background with its cold greens, there is nothing to make the picture agreeable. M. Billet, a disciple of the former manner of M. Jules Breton, recalls his master very pleasantly in the large picture of *Grass Cutters* (111). For the school of boudoir interiors and sofa coquetry, which used to fill too large a place in this gallery in the persons of M. Toulmouche, M. Goupil, and other talents not of the first order—we are glad to see that this year it looks less prominent upon the walls. And M. A. Stevens, the real master of all those who cultivate this field both in France and Belgium, is represented by an exceedingly subtle piece of decorative interior colour (*An Idle Hour*, No. 12): the greens of a sofa-cover and of a tall plant brought into quite original relations with the blues of the wall-hangings, the grey of the lady's gown, and a strip of red drugget underneath. The *Jewel Cabinet* (155) of M. Verhas may be selected as a carefully studied example in a similar vein. And here perhaps is the place to notice another order of *genre* painting, of which M. Vibert is the most distinguished representative. M. Vibert is accustomed to paint groups of small figures, generally in foreign or historical costume, with an expressive draughtsmanship which some of his admirers compare to that of Meissonnier, and at the same time with a severity of feeling and method by which others think that he rivals Gérôme. Certainly he is a precise draughtsman and a severe worker on the miniature scale, with a keen sense of character, and a keen if somewhat coarse sense of colour. Of his three contributions in this place, the *Theological Difficulty* will be the most popular with the English public: it represents with plenty of humour the repletion and the petulance of two robed ecclesiastics, who have dined, debated, and quarrelled, and who now sulk with their arm-chairs turned back to back, and an opened tome flung face downwards on the floor between them. Not very far removed from this is the manner of M. Berne-Bellecour, who a year or two ago came much into notice with studies of war episodes. His large picture of *Rent Day* (50)—a Frenchman's treatment of the well-known subject of Wilkie—is full of bright and clever workmanship; but the little studies of soldiers have more true quality, and still more the humorous study of a Roman livery-servant (38), tired out with a trudge across the Campagna, and

sitting hot and disconsolate by the wayside in his shirt-sleeves and without his wig. With M. Bouguereau, M. Merle, and M. James Bertaud, each represented by an equally characteristic example of rapid accomplishment and artificial grace, we need not concern ourselves; but an academic hand of somewhat higher powers, M. Hébert, will attract notice with his *Madonna and Child*. M. Hébert, in the fine naked figure standing among irises, lately exhibited by the MM. Goupil at Paris, has shown that he is in no decline of power; but this religious piece, of which the low tones and somewhat luscious outlines disagree signally with the archaic expedient of the aureoles laid on in bright gold, must be acknowledged a somewhat unfortunate experiment. With this we take leave of the figure painters of France. French landscape is represented by several small but unusually good examples. The solemn and harmonious coast scene of Troyon (135) is perhaps the most remarkable; and after this, a Daubigny of quite exceptional tranquillity and refinement (52), and the brilliant little sunset of Diaz (87).

Among the Belgian and Flemish groups, the public that loves pretentious vigour and melodramatic history will miss the handiwork of Gallait. The *Fisherman's Family* of M. Israels (159) is too much in his regular vein to call for special observation. The schools of Germany are not in any numerical force; though Bavarian art sends us a refined example in the *Who Comes?* of F. A. Kaulbach—a damsel and dog on a hillside, in the attitude of expectancy not unalarmed but very firm, a slight contraction of the eyebrows being visible both in the girl and her brute companion. Knaus is a distinguished name to which the portrait group of two children—somewhat hot in colour, and broken and *chiffonné* in arrangement—does not do justice. Several Italian names—those of MM. Boldini, Capobianchi, Palmaroli, and others—appear attached to works of a more or less sparkling talent in the vein of French *genre*. The Spanish names of Fortuny and Madrazo, generally in such favour at this exhibition, do not appear. Whether M. Ribera is a Spaniard or an Italian I do not know; but one of the cleverest things on the walls is his picture (No. 33) of *Italian Acrobats*—a troupe in stage silks, and paint through which their faces show blue, tramping ill-wrapped on an inclement day through the snowy streets. Of works that represent the remote and Northern schools, by far the most remarkable is the *Port of Warholm*, by A. Wahlberg (148). This is a vigorous scenic disposition, coarse enough in handling but subtle as well as striking in the result, of effects with which an Englishman is unfamiliar: it is an imperfect northern night, and the moonlight breaks through clouds of a strange smoky purple, and pours a flood of strange smoky yellow light upon the harbour, with its dark ships and boats and houses; while the colours of daylight, both blue sky and red clouds, hold their own along the horizon in spite of night and moon. SIDNEY COLVIN.

MR. NEWTON'S THIRD LECTURE ON MR. WOOD'S DISCOVERIES AT EPHESUS.

ROYAL INSTITUTION (March 28).

MR. NEWTON'S third and concluding lecture on Ephesus gave a summary of Mr. Wood's operations there since 1863, when he began his search for the Temple of Diana, depending almost entirely on his private resources. Between 1863 and 1867 Mr. Wood excavated the Odeum, where he found four interesting letters from the Emperor Antoninus Pius to the people of Ephesus, by which Mr. Waddington has been enabled to fix the chronology of his memoir on the rhetor Aristides. He also explored the Great Theatre, where he found seven blocks of marble, on which were a number of decrees of the people of Ephesus of the fourth century B.C., and of historical interest. These stones were recognised as having belonged to the cella of the Temple of Diana, burnt by

Herostratus, because in several of them it is ordered that the decree be inscribed "in the temple of Artemis." In the theatre was also found the long inscription containing the dedication by Salutaris, referred to in the previous lectures. The line of procession from the Temple of Diana to the theatre, as marked out in this inscription, first suggested to Mr. Wood the possibility of finding the temple by tracing out the ancient roads which issued out of the city from two of its gates, presumed to be respectively the Magnesian and Koresian Gates named in the inscription. Outside the Magnesian Gate Mr. Wood found the remains of the portico built by Damianus, in the second century A.D., to protect the processions in bad weather. An ancient way, flanked by Roman tombs, was traced for some distance by the side of this portico. The road leading out of the Koresian Gate was similarly traced, in the hope that the two roads might be found to converge towards the temple. After a time all trace of the two roads was lost, but sinking holes in the plain between the city and the mosque, Mr. Wood had the good fortune to stumble on the angle of the peribolos wall which surrounded the temenos of the temple, and doubtless determined the limits of the asylum. This was proved by an inscription in duplicate inserted in the wall, which stated that the Emperor Augustus, out of the revenues of the goddess, had surrounded the temple of Artemis with a wall. After this discovery, the search for the site of the temple was, of course, concentrated within the area defined by the direction of the two sides of the peribolos as far as they could be traced. This search was continued through the season of 1870. In February, 1871, the site of the temple was finally established by the discovery of the base of a column in position, and a large area of marble pavement, at a depth varying from eighteen to twenty-one feet.

From this time onwards the excavations have been vigorously carried on, and were brought to a close in February of this year, after the whole site of the temple had been laid bare. The lecturer then gave a short summary of the statements of the ancients about the temple, with the view of showing how far they were corroborated by Mr. Wood's discoveries. The building of the first temple probably began about B.C. 580. Chersiphron and his son Metagenes were its first architects; it was finished by Demetrios and Paeonios, about B.C. 460. By the advice of Theodoros of Samos the foundations were laid on fleeces of wool, under which was strewn a layer of charcoal. This was done to prevent the damp rising. After the first temple had been burnt by Herostratus, a second was built, which was in course of construction when Alexander the Great invaded Asia. We know from Vitruvius that this temple was of the Ionic order, and that it was dipteral and octastyle. Pliny states that the extreme length of the temple (*universum templum*) was 425 ft. by 225 ft. breadth, and that it had 127 columns, of which 36 were sculptured in relief. The lecturer then explained the process by which Mr. Wood had, by the study of the remains *in situ*, reconstructed the plan of the temple, obtaining a total length of 418 ft. by 230 ft., measured on the lowest step of the platform on which the temple stood. He makes the intercolumniation 17 ft. 1 in. The diameter of the columns at their bases being six feet, Mr. Wood finds that Pliny's height, 60 ft., for the columns, gives rather too slender a proportion. Of the several members which compose the order, such as cornice, frieze, architrave, columns with their bases and capitals, sufficient remains were found to determine the relative proportions of these members, except in the case of the frieze, no portion of which has been recognised in the ruins. Several drums of columns sculptured with figures in relief were found, showing what Pliny meant by the *caelatae columnae*; and it is curious that these sculptures in relief are rudely indicated in the representation of the temple on a coin of Ephesus of the Imperial period.

The architecture was coloured, and gold appears to have been inlaid in some of the mouldings. In the pavement were found the mortices in which were inserted the standards of a metallic grating which separated the pronaos from the peristyle. In the foundations were found a number of fragments of sculpture very similar in style to those discovered by Mr. Newton on the Sacred Way at Branchidae; these are doubtless remains of the first temple. Lastly, on taking up the foundations of the pavement, the original layer of charcoal laid down about a.c. 580 was discovered in several places. The lecturer then briefly enumerated the celebrated paintings and other works of art formerly dedicated in the temple, and drew attention to the statues of wounded Amazons, of which several replicas exist in museums, and which have been thought with probability to be replicas of the celebrated statues in bronze by Phidias and some of his distinguished contemporaries which were dedicated in the first temple. The lecturer concluded by drawing attention to the great merits of Mr. Wood, who by extraordinary sagacity and perseverance, and in spite of very great difficulties, had brought this remarkable enterprise to a successful result.

ART SALES.

AN important sale of pictures of the English School took place, as already announced, at the Hôtel Drouot on the 20th ult. The following prices were realised: Constable, *View beyond Richmond*, 27,000 fr.; Cotman, *The Market-boat*, 3,600 fr.; *Dutch Boats in a Calm*, 3,000 fr.; J. Crome, *The Old Oak*, 9,000 fr.; *Environs of Norwich*, 3,750 fr.; J. B. Crome, *Moonlight*, 11,700 fr.; *Village on the Yare*, 5,750 fr.; *Banks of the Yare*, 3,700 fr.; Fraser, *The Fisherman's Rest*, 4,250 fr.; Frith, *Goodnight, Baby!* 3,400 fr.; Inskip, *Landscape*, 1,850 fr.; Ladbrooke, *Heaths of Mousehold*, 19,000 fr.; Nasmyth, *Landscape in Surrey*, 15,000 fr.; *The Cottage*, 3,020 fr.; Romney, *Portrait of Alexander Cruden* (sketch), 500 fr.; Stark, *Pont de l'Évêque*, 3,350 fr.; *Norfolk Coast near Yarmouth*, 6,200 fr.; Turner, *View in Scotland*, 6,600 fr.; Vincent, *Landscape and Animals*, 1,120 fr.; *Landscape*, 2,080 fr.; *Plains near Norfolk*, 2,620 fr.; *Banks of the Yare*, 1,000 fr.; Wilson, *Solitude*, 2,000 fr.; Turner, *Rescue of Shipwrecked Mariners* (water colour), 3,000 fr. The whole collection fetched 149,615 francs net.

THE interesting collection of china, consisting principally of examples of the old English manufactures, formed by Lady Frances Russell, was sold by Messrs. Sotheby, Wilkinson, and Hodge, in Wellington-street, on Monday and Tuesday week. There were numerous groups and figures of Chelsea and Bow. Among the latter were four figures representing the *Seasons*, which sold for 46l.; a pair of Chelsea vases, 45l.; a pair of figures representing a sailor and his sweetheart, 46l.; a group of the *Musical Party*, 52l.; four Derby figures of the *Seasons*, 52l.; and a figure representing *Sir John Falstaff*, from the same factory, 35l. Among the examples of old Worcester, a teapot sold for 20l., and a pair of oblong baskets 27l. 10s. An old Dresden cabaret, 30l., and a pair of old Dresden vases, 98l. A small Sèvres cup and saucer, with panels painted with subjects after Fraudenburg, 78l.

THE valuable and extensive collection of porcelain, &c., of the late Hon. Francis Forbes, was sold on Wednesday, Thursday, and Friday in last week, by Messrs. Christie, Manson, and Woods. The collection was rich in specimens of fine old Dresden, Vienna, and Marcolini services; Berlin, Fürstenburg, Frankenthal, Oriental, and other porcelain; snuffboxes of gold, agate, and enamel; watches, old German clocks, silver figures, carved and gilt decorative furniture, ormolu work, &c. Of the miniatures, one of Princess Maria Clementina Sobieski, wife of Prince James Stuart, son of James II., oval enamel, set in gold clasp, sold for

79l. Another, of a lady in a green dress, signed "I. H. 1620," in enamelled locket frame, 56l.; another, of Prince James Stuart, signed "S. P.," 10 guineas. An old repeater watch, by Whiteaves, in double gold case, in a red leather case, inscribed "Horologium Taddei Kosciuszko viri immortalis Pignus amicitiae Georgii Washington, MDCCCLXXXIII," 17 guineas. A pair of groups of Dresden figures, "Asia and Africa," sold for 108l.; and a magnificent old centre piece, formed as a basket on four legs, pierced and encrusted with figures, birds, and flowers, on oval shaped plinth, painted with plants and mounted with metal gilt, with four Chinese figures riding on birds, *en suite*; a group of swans, four groups of figures, and a group of hen and chickens, all *en suite*, 913l. An early Dresden tankard, with Chinese figures in gold, and flowers in relief in colours, mounted with chased silver gilt, with an eagle on lid, 41l. A pair of teapots, formed as birds, 29l. The total of the three days' sale was 2,666l.

THE sale of the Evrard collection which has just taken place at Brussels, fetched, says the *Moniteur Belge*, 450,000 francs the first day. An *Hungarian Equipage in a Marsh*, by Schreyer, sold for 15,500 fr.; *A Bull*, by Troyon, 13,000 fr.; *The Smoker*, Roybet, 10,000 fr.; *Gulliver at Liliput*, 20,000 fr.; *View of the Environs of Paris*, Rousseau, 10,000 fr.; *Peace and War*, Gallait, 21,000 fr.; *Sunset on the Beach at Villerville*, Daubigny, 15,500 fr.

THE following were the highest prices realised at the sale of the late Mr. Crayen's collection by Messrs. Christie, Manson & Woods, the three day's sale of which ended yesterday:—*Landscape and Sheep*, by T. Creswick, R.A., and T. S. Cooper, R.A., 420l.; *Storm on the Coast*, by E. Gill, 158l. 11s.; *Out of the Sun*, by T. S. Cooper, R.A., 211l. 1s.; *A Lane in Surrey*, by F. W. Hulme, 190l. 10s.; *Sunset*, by R. W. Leader, 168l.; *Woodcutters*, by J. Linnell, 106l.; *Fête Champêtre*, by F. Goodall, 194l. 5s.; *Welsh Birchwood*, by R. W. Leader, 262l. 10s.; *Amy Robart and Leicester*, by E. M. Ward, R.A., 189l.; *Over the Hill*, by J. Linnell, sen., 871l. 10s.; *The Coming Storm*, by T. S. Cooper, R.A., 420l.; *Rembrandt's Studio*, by Sir J. Gilbert, A.R.A., 525l.; *The Naturalist*, by Madrazo, 194l. 5s.; *Virtues*, by L. Perrault, 231l.; *Going to Market*, by Verboekhoven, 190l. 10s.; *Maiden's Prayer*, by L. Perrault, 267l. 15s.; *Improvisatore*, by Phillippeau, 189l.; *Forgiveness*, by L. Perrault, 241l.; *Bo-peep*, by L. Perrault, 215l.; *The Fruit Fair*, by J. B. Burgess, 273l.; *A Welsh River*, by R. W. Leader, 257l. 5s.; *The Boudoir*, by L. Perrault, 215l. 5s.; *Watching the Crab*, by H. Merle, 201l. 12s.; *The Mendicant*, by H. Merle, 577l. 10s.; *Shipwreck*, by C. Weber, 181l. 5s.; *Coming out of Church*, by Madrazo, 157l. 10s.; *The Widow's Hope*, by Perrault, 116l. 10s.; *The Baby Brother*, by L. Perrault, 315l.; *A Pompeian Interior*, 178l. 10s. The sale consisted of 368 lots, and the total amount realised was 19,969l.

NOTES AND NEWS.

IN a letter addressed to the Athenian journal *Nea Hellas*, Dr. Schliemann informs the Athenians that he is going to leave them. He had offered to build a museum at Athens at his own expense, to deposit there all the antiquities which he had discovered, on condition that Government would allow him to excavate at Mycenae and Olympia, the proceeds of the excavations to become equally the property of the nation, and to be deposited in the Schliemann Museum. Parliament accepted his offer, but the Government has declined to sanction it, and Dr. Schliemann now announces that he will leave Greece for ever.

WE are glad to hear that *Spring*, a picture lately completed by Mr. Frank Dicey, is about to be engraved. The lightly draped figure of Spring moves buoyantly in the centre of an English meadow landscape, lit by a brilliant gleam

of April sunshine. The sentiment of the design is graceful and poetic, the river-grass and bordering willows of the background are rendered with delightful freshness and delicacy, and the tone is in perfect keeping throughout. Mr. Dicey seems to be making substantial progress. In another picture, also recently finished, a conversation portrait of three children engaged in building a house of cards, he shows good feeling for grouping his subjects and a genuine sense of the value of refined harmonies of colour. But these are qualities which Mr. Dicey's work (which generally seems somewhat wanting in strength and solid acquirement) never lacks, and in a third picture we find them redeeming the eternal commonplaces of an incipient love affair. The young gentleman who has gone out shooting, in drab and knickerbockers, finds the topmost bar of a stile in his path occupied by the young lady. The gun is laid aside, and a sentimental conversation has commenced, which appears likely to take a more serious turn. The foliage background is bright and pretty, Mr. Dicey has handled his subject with taste and tact, and has imparted to the actors an air of good breeding and elegance.

MR. H. S. MARKS, A.R.A., will send three pictures to the Royal Academy—all of them humorous, of course, but with humour and other more distinctly artistic qualities mixed in very different proportions. The largest work, and the one most likely, we suppose, to succeed with the great public at Burlington House, is called *Labour and Capital*. It is a Middle Age setting of a story common enough in our own day: a deputation waits upon an employer and solicits an increase of pay. Here the employer is a noble who is building his castle; the architect stands by with the plans, and the spokesman of the deputation pleads earnestly in words and eloquently by gesture. The pleading is in his face; the determination, apparently, in the faces of those who have put forward, to urge their cause, the most civil of their number. And the cause will clearly be gained. One sees that, in all these resolute attitudes, and also in the patience and *bonhomie* of the noble. He is a man who can afford to lose, and he knows it, and is at his ease. The workman-type does not seem to have altered much, though here and there is an old-world face, the likeness to which has faded out of our actual generation. Of course each man is a character, and has been a separate subject of well-considered study. But the subject is after all too grim in its associations—however pleasantly and picturesquely it may be treated here—for the work to be wholly satisfactory and delightful to us. We shall remember with the most unmingled pleasure that green undulating landscape at the back of the builders; a glimpse of quiet unspoiled English country, dotted here and there with gabled roof of homestead. The same quality of landscape art is indicated in a smaller picture, called *A Page of Rabelais*. Here is a green country lane, with pleasant ways, green trees, and irregular palings, and a young ecclesiastic walks along, and his thought is deep in the printed page. He is very quietly amused, and the seclusion, with the freshness and the brightness of the scene, fit his pleasure well. But perhaps the most characteristic picture—in our eyes the most complete and successful—is the last, which represents a mercer's shop of the time of Edward IV. There are present two persons, shopkeeper and customer, and the customer (a young woman not quite insensible to the charm of dress), is undecided which of two head-dresses she shall choose and take away. A flowered fabric also lies on the counter for choice, and cloths of Ypres—exquisite blues that are well nigh greens; greens that are well nigh blues—lie upon a shelf, and all are tempting; and on a panel behind the persuasive mercer, who will sell at last the dearest of his wares, is a painting of a man and a woman, an apple and a tree; and that, of course, is the Temptation, which is ever renewed.

It has recently been discovered that an artist may create quite as much interest in his picture by sending it in to the Academy on the morning of the eventful day on which his studio is to be infested with a mixed multitude of admiring friends and covert critics, as by subjecting it to the usual routine of exhibition on the easel. At least, such is the conclusion to which an incident occurring in the preparations for this year's exhibition would naturally lead one. Amongst the objects which are to confound the indiscriminating public in the rooms of the Royal Academy is a picture by an artist of known ability, who, wintering abroad, left directions for the customary opening of his studio and viewing of his year's work. The individual, however, on whom devolved the high privilege of conveying the production to its fated—and sometimes fatal—nails on the coveted walls of Burlington House, insisted, perhaps with a view to the economising of labour, upon effecting the transport on the very morning of the day on which the jury were to inspect the body previously to returning verdict. When the visitors arrived, the picture was—gone. But *quand nous n'avons pas ce que nous aimons, il faut aimer ce que nous avons*. The portfolios and the earlier pictures were inspected, with the result of the complete mystification of the less artistic part of the viewers, who could not make up their minds whether they had, or had not, seen the picture for which they came; whilst those who did understand the real state of the case declared their resolution that their first look on entering the Academy rooms should be given to the missing picture—a not unimportant condition in the case of those who make a point of persistently gazing at every picture in succession, so that their appreciative and critical powers, such as they are, become somewhat weakened by the time they arrive at the end.

As supplementary to the International Exhibition, it is proposed to form a loan Ethnological Collection, to be placed in the top gallery of the Albert Hall. A committee has been formed for that purpose consisting of Mr. H. Cole, Sir Vincent Eyre, Sir Bartle Frere, Mr. Ferguson, Mr. Vaux, Mr. Forbes Watson and others; and the Church Missionary Society, the India Office, the Asiatic Society, and the United Service Museum have offered contributions from their rich collections.

THE South Kensington Museum have just placed in their Ceramic Gallery a collection of above one hundred Staffordshire figures, purchased of Mrs. Halliburton for the sum of 320*l*. Desirable as they may be in a ceramic museum where the manufacture is represented in all its gradations, we can hardly think them well placed in a Fine Art collection. There is neither beauty nor teaching in their figures, with some exceptions modelled by inferior artists, and executed by still more inferior potters; and their proper place, we should say, is the cottage chimney pieces from which they were taken, and for the adornment of which they were originally designed.

THE *Lombardia* of the 2nd inst. announces the discovery, in a wall of the municipal school-room in the Via di Sant'Orsola, of a valuable painting, the presumed work of a pupil of Bernadino Luini. Steps have been taken by the city for the preservation of this work of art. The school building was formerly a Franciscan convent, founded in 1404 and suppressed in 1782. The chapel annexed has lately been demolished, and converted into an oven for the use of the soldiers.

THE new French school which has been planted in Rome as a sort of shoot from the school at Athens, and which at first sight looked like a growth of the national hostility to Prussia and a challenge to the Prussian Institute on the Capitol, stands on excellent terms with the latter, as we learn from a private source. The head of the new school is M. A. Dumont, one of the ablest of the rising French archaeologists, and the students selected up to now are: one for palaeography, one

for classical, and one for Christian archaeology, one for history, and one for the art of the middle ages and Renaissance. With a Minister of Public Instruction on Fine Arts a similar experiment might be made by this country. It could not be tried without such an official, and, as matters are now managed here, otherwise than by setting in motion a vast system of machinery which, after all, might not be justified by the result. It will be interesting to watch the French scheme developing itself.

M. REYSSON suggests in the *Revue des Deux Mondes* that a collection of plaster casts of all the master-pieces of antiquity scattered throughout Europe should be added to the Museum of Sculptures at the Louvre. It is remarked hereupon that the great difficulty would be to free these master-pieces from the noses, hands, feet, and heads which the "restorers" have fastened upon them. The Museum of Berlin possesses, according to *Figaro*, incomparable atrocities in this kind.

In the Report of the Director of the National Gallery which was laid before Parliament last week, it was stated that, owing to the great number of applicants for permission to copy Landseer's works, it has been found necessary to pass a resolution that no more than two students should be allowed to copy or study from any one of his pictures in the Gallery at the same time. The number of visitors last year at Trafalgar Square amounted to 836,194, and at South Kensington to 859,037, making a total of 1,695,231. The daily average at Trafalgar Square was 4,410.

THE question asked most frequently in Paris society last week was, according to the *Figaro*, "Have you been to the rue Chaptal to see the pictures destined for the Exhibition?" Hébert's famous *Virgin and Child*, before mentioned in the ACADEMY, was the chief subject of interest; but four paintings by Gérôme, one representing Frederick the Great at Potsdam on his return from hunting, a charming Meissonnier, a great sensational war subject by Detaille, and several other works by the best artists of France, were pronounced well worth the trouble of an early acquaintance before their public exhibition.

THE exhibition at Rheims, organised by the Society of the "Amis des Arts," is now open, and is criticised by M. G. Lafenestre in the *Chronique*. Parodying the words of a fine lady of the Court of Louis XIV., who remarked, on seeing the Loire for the first time, "C'est un fort beau fleuve pour un fleuve de province;" he tells us that the Rheims exhibition is "very good for a provincial exhibition."

Rouen comes next: its exhibition will open on May 14. We may remind English artists that foreigners are invited to contribute.

THE STAGE.

REHEARSALS.

THERE are probably several points of present stage practice in which we should improve by faithful reference to the better ways of an earlier generation than our own; but in the matter of rehearsals—respecting which, one may offer a few remarks—there is more to be learnt by reference to the ways of the French stage than by any revival of the traditions of what are called the "palmy days" of the English drama. And for this there are at least a couple of reasons. First, it is probable that at no time in England was there bestowed upon rehearsals quite the amount of care that is now given to them in France; secondly, whatever may have been the care bestowed in the days of Garrick or Mrs. Siddons, our knowledge of the same comes only through our knowledge of the greater actors,—that is, of actors of genius. Now, actors of genius are precisely those who need to give the least care, and who give in truth the most—one of the proofs of genius being the capa-

city for taking pains. Whether or no the rank and file of the stage took trouble at rehearsals, we may be sure the leaders did; and it is their trouble that we can know about. But that which it is more important to know, is, how far care in rehearsals is practised by the ordinary men and women of the day in France, and how far the care has been justified, nay, rewarded, by success.

Speaking roughly, English actors do their rehearsing in public: French actors, in private. Practically, here in London, a first-night audience is privileged to attend a rehearsal, and not a performance. Of course there have been repetitions beforehand: no one would be so simple as to suppose that there had not: but the insufficiency of those repetitions is constantly made evident. Now there is heard the voice of the prompter: not loud enough or often enough to indicate that the actor has not learnt most of his part, but if heard at all, *this* at least is indicated—that the actor has not learnt his part till he is master of it, (fancy dropped notes or wrong notes in a recital by Hallé!) and that having failed to do this, his attention is now and again distracted; so that it is impossible for him to live in the character: in a word, he is not so much representing his part as feeling his way towards the representation of it. Then there are minor mishaps, which interfere with the success of the evening, though they may not altogether spoil it. Of these, are long waits while the carpenters bungle with scenery; and the non-appearance of some *dramatis persona* who, according to the dialogue, has long been in sight. Loquacious Launcelot Gobbo is suddenly dumb, save for an awkward interlude of coughing, while old Gobbo, who, sand-blind, should be slowly groping on the stage, is running at break-neck pace down the dressing-room staircase: the patience of the call-boy being exhausted before that of the audience. But the first imperfection—that of the actor who requires occasional prompting—is the most serious one we have named already; and it is not seldom present. And when it is absent, there is present something that is generally as fatal to artistic excellence—a want of *ensemble*: a want of the appearance of habit and of naturalness.

And here it is that we strike the point of comparison between English practice and the practice of the French. Granting that our actors know their words, their exits and their entrances, they are without the ease which comes of continual repetition, continual familiarity; and their rehearsals have not been presided over by one who in endeavouring to get *ensemble* (as every stage manager does) has not forgotten that *ensemble* is, after all, made up of nothing but harmonious details. The presence on the stage during the period of rehearsal, of a thoroughly trained and cultivated artist, who gives a word here and a word there—what have we as a substitute for that? Twenty years ago, we had this very thing, to some extent, at the Princess's, if all the stories that one hears of Mr. Charles Kean be true; and we are very far from saying that there are not now attached to at least two or three of the theatres of London, stage-managers who can do something more than manage the mere mechanical come-and-go of the performers: men, indeed, whose taste and judgment have done much for the completeness of our pleasure. But probably there is no one in England—not even Mr. Calvert, in the North, or Mr. Tom Taylor—who can bring, or has been able to bring, that union of the greatest practical experience with the keenest and most delicate artistic discrimination which is wanted to make a perfect rehearsal, and therefore a perfect performance. For now the manager who is manager only, is at a loss, and now the author who is chiefly author is at a loss. It would be unreasonable to expect that many actors should have the modesty of Mohun, who, when Nat Lee was reading to him one of his tragedies, exclaimed in despair, "Unless I could play the character as beautifully as you read it, it were vain to try it at all." The common feeling is that actors and actresses are unwilling to take the

suggestions of authors. There is some truth in this, no doubt; but not very much. The best test of the real quality of an actor is his readiness to take such counsel as is worth having. But then it must be remembered in fairness that an inexperienced author will probably give much counsel that is *not* worth having; and it is probably in part owing to this, and in part owing to the fact that only rarely does a manager concern himself minutely with the artistic details of a representation, that a London theatre is something of a republic in these matters—an orchestra in which each musician plays at his own sweet will.

Perhaps it would be hardly just to compare the method of rehearsal adopted at the Théâtre Français with that of our London theatres; because, until State aid shall smooth the path to the attainment of artistic excellence, the conditions will remain unequal. At the Théâtre Français, the most competent of managers directs the most competent and complete body of actors, in the performance of literary works which are the production of the most artistic writers of an artistic people. At the London theatres—but we will not insist upon the comparison. But there is no reason why whatever completeness is attained in Paris at the Gymnase should not be steadily sought for and eventually attained in London. For there is no subsidy at the Gymnase, and no hurry in London. When a piece runs a couple of hundred nights, there is surely time enough in which to prepare another. And if we had Monsieur Montigny's equal, we should probably have actors willing to listen to him. But at present I do not think his method of conducting a rehearsal is practised in London. His method is almost universal in Paris, but the care which he gives to it is his own. I was present once at a rehearsal in his theatre. He was instructing one of the first of French *comédiennes* in her part. And one of the first of French *comédiennes*—it was Mdlle. Blanche Pierson—did not flout; nay, did not even raise her eyebrows in sign of polite surprise, at that which unartistic persons would have called his fidgetiness. She listened to him with absorbed attention, and followed him with all possible exactness; though it was not a pleasant thing, in the hearing of a score of people, for one distinguished person to repeat a phrase more than a dozen times at the bidding of another. And the point of my reminiscence—which many a London manager and London actress will be able to confirm and to surpass, but which I nevertheless commend to them—is this, that it was no general conception of the character that was then under discussion, and not even the behaviour of that character at a critical moment of the play, but a mere question of intonation, the inflection of the voice in a single phrase of a passage not specially notable; and when I say this, the reader who is playgoer only, and not actor or critic at all, will have some idea of the pains bestowed upon rehearsals by a leading Paris manager and a leading French actress. To this it may be objected that there is something of servility in this conduct of an actress who is supposed to be clever—that it savours of Thackeray's Arabella Fotheringay and of the old man of genius who gave her everything but her beauty. But this is not so, for malleability is among the best qualities of an actress (at all events authors with ideas of their own are accustomed to think so), and it has added greatly to the success, artistic and personal and commercial, of more than one English lady who has within the last few years made the stage her profession. And of course it is well understood that when a player listens to an author, an author may listen to a player too. Dryden took counsel of Betterton. And we may be sure that, in the main, Mdlle. Pierson was not the less individual because she listened to Montigny.

Under the actual conditions of the provincial theatre, it is impossible to bestow upon rehearsals that amount of attention which is not at all impossible in London. The constant change in the bill of the play forbids it, and the acting must be rough

in consequence. What is one to do with six new parts in a single week? Yet that has actually been known. A star performer, desiring to appear in half-a-dozen characters in a week's engagement, has before now made it necessary for the members of the regular company to learn a new part every day, and the same day to rehearse it, and the same day to act it. What with "study" in the small hours of the morning, and one long rehearsal from twelve till four of the clock, and last, a performance in the evening from seven to eleven, the actors were worn out. But London actors are more fortunate than they, for they know no such insuperable gulf as is fixed between the overworked provincial player and the attainment of excellence.

FREDERICK WEDMORE.

MISS LEIGHTON, a pupil of Mr. Ryder's, made her first appearance on any stage at the Queen's Theatre, last Saturday, as Julia in *The Hunchback*. We were in another place that evening, but we hear of several bouquets having been thrown at the lady, and we read in the *Times* that the *début* was a successful one. The *Observer*, on the other hand, does not seem quite so sure of this. It states, oracularly, that Miss Leighton "may make an actress some day." So may the reader.

The Prayer in the Storm, an old Adelphi melodrama of one forgets how many years ago, and derived originally from a theatre of the Boulevard, was revived at the Adelphi a few nights since. Those who demand probability at the theatre will go away dissatisfied, from seeing it; but those who want the excitement of adventure will stay, and go, contented. The sort of thing which Desdemona must have heard at the feet of Othello (but which Shakspeare did not report), is now to be matched in breathlessness of interest by the adventures enacted at the Adelphi. And there is some scope for acting. Miss Geneviève Ward, in a part made famous by Madame Celeste, has made a first appearance which has been confessedly successful. She has some breadth of style, some freedom of manner and movement; in a word, she is competent to the performance of a part which, while it is important, is none the easier for not being quite natural. Mr. J. Fernandez, Mr. Brittain Wright, Miss Cicely Nott, and others, make up a cast which is not unfitted for the interpretation of a piece which bids fair once more to be popular. The scenic arrangements are good.

ON Monday evening they produced at the Globe a little piece, in one act, called *Our Bitterest Foe*. It is a piece of serious interest, and is written gracefully, by Mr. Herbert. It deals with the loves of a Frenchman and a Prussian for one woman, in the time of the war. The Prussian owes much to the French girl, and pays it by allowing her at last to go free with the lover of her choice. An idea that is not new has been pleasantly treated, nor does the piece lose anything by the acting, which is in the hands of only three persons—Mr. Emery, Mr. Montague, and Miss Carlotta Addison.

THE story of M. Octave Feuillet's *Sphinx*, now acted at the Théâtre Français, deserves to be told upon its own account, though public attention in Paris is concentrated upon the question of Mdlle. Croizette's death-scene at the end, and everybody is discussing whether that belongs by right to the art of the theatre or the science of the hospital. The title of the piece—*Le Sphinx*—is itself enigmatical. It does not refer to any sphinx-like personage, as one would of course suppose, but only to a sphinx-headed finger-ring, which contains such poison as Mr. Browning writes of in his *Laboratory*. The piece opens in Touraine, where Blanche de Chelles, a young married woman, whose husband is at sea, is living under the guardianship of her husband's father, but surrounded in truth by admirers who would fain be lovers too. Why does she hold this court of hers in a country house, when Paris would seem to be the proper place? Because, coquette though she

is, she is capable of serious attachments, and she counts much on an old friendship with one Berthe de Savigny: one who is more than friend—an adopted sister—whom she has succeeded in marrying to the aide-de-camp of her father, the Admiral. De Savigny is a grave man, and is not too well satisfied to see a friendship between his wife and one of the light manners of Madame de Chelles. He seeks an interview with the coquette, so that there may be an explanation of his views; and, getting it, he learns more than he bargained for—the coquetry of Mdlle. de Chelles is bestowed on the rest; the love is reserved for himself. She gives him letters to read—letters that she has written, but would not send, and at last it is hardly plain to her whether he disbelieves her love for him, or only affects to do so. More strictly perhaps in accordance with the dramatist's purpose than in accordance with nature, Berthe de Savigny becomes suddenly jealous. Her husband reassures her; he kneels at her feet; and a very French impulse, half good, half bad, prompts Blanche to run away, like Edith Dombey, with a man she does not care for, but, in this case, more out of love than hate for those who will be left behind. By this means Berthe will be reassured, and Berthe's husband—loved of both—put at rest. But one would have thought the same purpose might have been attained by running away with nobody: neither Lord Astley, whom she detests, nor De Savigny whom she loves—by a prosaic fidelity to her own husband, in fine. But she and M. Octave Feuillet have thought differently, and Blanche is about to depart with Lord Astley. Berthe insists upon her husband stopping her, but at what cost can he stop her? At the cost, only, of avowing his own love. Well, then, Blanche will not go after all; but Berthe has seen the embrace by which was purchased, so to speak, the fugitive's determination to remain. Presently, Berthe having held her peace, the two women meet, and from neither is anything hidden. Berthe submits an *ultimatum* to her rival—either the rival must go away for ever, or she will show to the Admiral (who is the guardian of the husband's honour) the letters in which a fatal avowal is made; and the Admiral, who had not been forgiving to his own first wife who had been false to him, will certainly not be forgiving to the woman who is false to his son. But "No," she says, drawing back after all. And courage and strength fail her. She faints. "Water!" Here is the glass; and here in Blanche's ring the poison which will end all. It is dropped into the water, and Blanche hesitates. She ends by drinking it herself. The most striking thing in the drama is the character of Blanche, and its performance by Mdlle. Croizette. The pleasant and redeeming thing is the character of Berthe, and its performance by Mdlle. Sarah Bernhardt.

MUSIC.

ROYAL ITALIAN OPERA—MDLLE. HEILBRON.

MR. GYE's operatic season at Covent Garden was inaugurated on Tuesday last. During the recess the house has been entirely redecorated, and its appearance is now not only brilliant but extremely tasteful. It is the usual custom to commence an operatic season with some well-known, if not well-worn work, nor was this custom departed from on the present occasion—the piece selected for the opening night being Verdi's *Traviata*. It is not necessary to speak in detail of an opera so well known and so popular as the present. Founded, as our readers will remember, on Dumas' *La Dame aux Camélias*, it is a favourite alike with *débutantes* and with the opera-going public—with the former as affording good opportunities of vocal and histrionic display, and with the latter as full of pretty and ear-catching melodies. When the tunes of an opera have become the common property of street-organs its claims to popularity can hardly be disputed.

The performance on Tuesday introduced to us a new Violetta—a Mdlle. Heilbron, from the Théâtre Italien in Paris, whose name had not been announced in Mr. Gye's prospectus. It was therefore chiefly on her that the interest of the performance centred, and it was evident at an early period of the evening that her success was secured. Of prepossessing personal appearance, the lady possesses a light soprano voice, enabling her to reach the high C and D flat without apparent difficulty, and of considerable flexibility. Her intonation was not absolutely perfect in some of the more florid parts of her music; but for this, as well as for a certain tendency to force her voice in forte passages, every allowance should be made for a first appearance upon a stage with which she was unfamiliar. Her *mezza voce* singing is admirable. But it is as an actress that we are inclined, so far as could be judged from a single performance, to form even a higher estimate of her than as a vocalist. She is quite at home with "stage business," and her by-play and command of facial expression are excellent without being overdone. Nothing could be more satisfactory than her delivery of the great scena which closes the first act. The pathos of the slow movement, "Ah forse è lui" was well realised, and the assumption of an evidently forced gaiety at the "Sempre libera" could hardly have been better expressed. Mdlle. Heilbron was called forward at the fall of the curtain. The favourable impression produced by the first act was strengthened rather than impaired by the later portions of the opera. In the duet with Germont, in the finale to the second act, and in the somewhat repulsive death-scene with which the opera closes, the new comer showed herself alike equal to the situation. Mr. Gye may be congratulated on a very useful addition to the ranks of his *prime donne*.

The remainder of the cast calls for no special notice, as it presented no feature of novelty. Alfredo was well played and carefully sung by Signor Nicolini, and the part of Germont (the "heavy father") was in the hands of that excellent artist Signor Cotogni, the subsidiary characters being played by Madame Anese, Mdlle. Corsi, Signori Tagliafico, Manfredi, Fallar, Raguer, and Rossi. Both band and chorus, under the direction of Signor Vianesi, were excellent, and the *mise-en-scène*, though the opera presents less opportunity than many others for spectacular display, was characterised by the completeness and artistic taste to which for so many years we have been accustomed at Covent Garden. The *Traviata* is announced for repetition this evening, when Mdlle. Heilbron will make her second appearance.

At the last Crystal Palace Concert Beethoven's "Septett," played by all the strings, took the place of the usual symphony. On the occasion of the recent performance of Schubert's Octett in the same manner, we expressed our views as to this kind of transformation of chamber into orchestral music, and gave reasons for maintaining that under no circumstances could the alteration be regarded as an improvement. It is needless to go into the subject again; but it is no more than just to say that Beethoven's work, being more intrinsically orchestral in character than Schubert's, suffered less from the strengthening of the string parts. Still, even here, there were many passages which certainly did not sound as the composer intended them; and therefore, while fully acknowledging the splendid performance by Mr. Manns's orchestra, we see no reason to modify our previously expressed opinion that such performances are, from an art point of view, an entire mistake. As usual at these concerts, some novelties were produced. On this occasion there were two. Reinecke's overture, "An Adventure of Handel's," which concluded the concert, is chiefly interesting from its clever orchestration, and the ingenious use made in it of the well-known melody commonly called the "Harmonious Blacksmith," often (though wrongly)

attributed to Handel. The other novelty was a more important work—Litolff's "Concerto-Symphonie" No. 3 (on Dutch national airs) for piano and orchestra. The work is very showy and brilliant, but of little real musical value. The subjects, excepting those of the scherzo, are commonplace, occasionally almost tawdry, though credit must be given to the composer for ingenious treatment and clever and effective instrumentation. The pianoforte part, which is in places of considerable difficulty, was admirably played by Mr. Oscar Beringer, who has been more than once previously heard at these concerts. To a finished technique Mr. Beringer unites a powerful yet singing quality of tone, and a mastery of the *bravura* style, which entitle him to a high position as a pianist. The vocalists were Madame Noriny and Mr. Santley. The lady, who appeared for the first time here, possesses a very powerful voice and considerable taste, but is far too much addicted to the singer's most pernicious failing—a constant *tremolo*. One can hardly, however, pronounce a decided opinion on anyone from a first appearance. Beethoven's overture to *Coriolan*, which opened the concert, was, it is hardly necessary to say, superbly played by the band. To-day a concert will be given, consisting for the most part of sacred music.

THE present series of the Monday Popular Concerts was brought to a brilliant and successful close last Monday evening. As usual at the Director's benefit, a larger number of works was brought forward than is generally the case, and most of Mr. Chappell's "staff" who are at present in London were pressed into the service. A brief enumeration of the works performed is all for which space can be spared. Mozart's popular string quintett in G minor was the opening piece, played by Messrs. Joachim, Ries, Straus, Zerbini, and Piatti. The last-named gentleman gave two movements from a sonata by Veracini; Mr. Charles Hallé and Madame Norman-Néruda played the variations in D minor from Mozart's sonata for piano and violin in F; and Mr. Hallé contributed as his solo Schubert's well-known Impromptu in B flat. The second part commenced with an interesting novelty, in the shape of Brahms's four-handed Variations in E flat on a theme by Schumann, to which full justice was done by Miss Agnes Zimmermann and Mr. Franklin Taylor. Herr Joachim performed three of Brahms's "Hungarian Dances," in his own arrangement for piano and violin, and in reply to a unanimous encore gave another of the same series. The concert concluded with Bach's Concerto in D minor, for two violins (Madame Norman-Néruda and Herr Joachim) with double-quartett accompaniment. Mr. Santley sang Handel's "Nasce al bosco," and the rest of the vocal music consisted of part-songs by the "Swedish Ladies' Vocal Quartett" (Mdlles. Hilda Wideberg, Amy Berg, Madame Maria Petterssohn, and Mdlle. Wilhelmina Soderlund), who gave some Swedish songs with exquisite finish of *ensemble*—this being, it should be mentioned, their first appearance in London. The hall was crowded by a more than usually demonstrative audience.

Mr. Chappell deserves the warmest thanks of the musical public for the spirit and enterprise he has shown during the past season. No fewer than twenty-two works have been produced (either at the Monday or the Saturday concerts) for the first time. Of these there have been three by Schumann, two each by Bach, Veracini, Rubinstein, and Brahms, and one each by Chopin, Bennett, Saint-Saëns, Schubert, Molique, Onslow, Rheinberger, Raff, Beethoven, Haydn, and Tartini. May the success of the present season encourage Mr. Chappell to further researches in similar directions next winter. There still remains a whole mine of wealth in the field of chamber compositions, which has been but very partially explored.

EBENEZER PROUT.

IN consequence of Good Friday falling in the present week, and the necessity, therefore, of our going to press much earlier than usual, it is impossible for us to notice in detail, as was our intention, Mr. Barnby's excellent series of concerts held during the week in the Albert Hall, as mentioned in our Notes of last week. Three consecutive performances of Bach's sublime *Passion according to Matthew* have been given; and the fact that such an experiment should have even been thought of redounds greatly to the credit of Mr. Barnby; for it must not be forgotten that the appreciation now accorded to this work, and the public favour in which it is held, are chiefly, if not entirely, due to the perseverance with which, year after year, he has brought it forward, and thus enabled concert-goers to become familiar with its beauties.

BACH's *Passion* has also been given during the week both in St. Paul's Cathedral and Westminster Abbey; in the former on Tuesday evening, and in the latter on Wednesday afternoon.

AT the Crystal Palace concert this afternoon, Brahms's "Song of Destiny," which was produced a fortnight since, as noticed in the ACADEMY, is to be repeated by special desire. A second opportunity of hearing this remarkable work will be most welcome.

THE posthumous works of the recently deceased composer, Henry Hugh Pierson, will probably be published by the firm of Schuberth and Co., in Leipzig.

WAGNER has issued invitations to the distinguished artists who are to take part in the grand performances at Bayreuth next year, to meet in that town during the summer in order to study their parts in the "Nibelungen-Trilogy." Herren Niemann and Betz—who, we understand, are respectively to take the parts of Siegmund and Wotan—intend to go for this purpose from Berlin.

A MONUMENT is to be erected to Robert Schumann at Leipzig.

ACCORDING to the Vienna papers, a tenor singer has recently presented himself to the physicians of that city who, by means of some abnormal formation of the vocal organs, is able to sing two notes at once!

LAST week the German Opera Company at Rotterdam produced, for the first time in Holland, a "grand opera in five acts," entitled *Diana von Solange*. It is a public secret on the continent that the music to this opera was composed by "E.H.z.S."—to wit, the reigning Duke of Saxe-Coburg-Gotha. The august composer was expected to be present at the first performance of his work, which has been highly spoken of in continental artistic circles.

THE production of several new operas is reported from the Continent. Among these are Kretzschmer's *Die Folkunger* at Dresden, *Agnes von Hohenstaufen* (by Fr. Marburg), at Freiburg in Baden, and Ponchielli's *I Lituani* at La Scala in Milan, all of which are said to have been successful.

A MUSICAL Conservatoire has been founded in the city of Mexico, and was opened on February 28 last.

WAGNER's *Rienzi* was produced for the first time at Venice on the 15th ult.

POSTSCRIPT.

MESSRS. LONGMANS have in the press *Roman Imperial Photographs*, being a selection of forty enlarged photographs from Roman medallions and coins, arranged by J. E. Lee, F.S.A., F.G.S. Also *Roman Imperial Profiles*, being a series of 140 lithographic profiles of Roman emperors, empresses, and Caesars, enlarged from Roman coins and medallions, by the same author. The same publishers announce *The French Revolution and First Empire*, an historical sketch by W. O'Connor Morris, as nearly ready.

SATURDAY, APRIL 11, 1874.

It is particularly requested that all letters respecting subscriptions, the delivery of copies, and other business matters, be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Rolls of the Court of Attachments of the Royal Forest of Waltham, in the County of Essex. Printed by order of the Epping Forest Commissioners.

THE Epping Forest Commissioners, in the course of their inquiry, have found it necessary to publish the Rolls of the Court of Attachments, or Verderers' Court, a Court whose duty it was to hear all offences relating to vert and venison, that is, damage to the soil and food, and damage to the beasts of the forests. These rolls are, we believe, almost a unique publication; we are not aware of any other Forest Court Rolls having been published, and hence these have a peculiar value of their own, for they show what was the actual practical working of those Forest Laws, of which we hear so much and know so little. With the exception of the Charter of the Forest, and the other statutes on Forestal matters, Manwood's *Forest Laws*, and that small part of the 44th Institute that treats of Forest Courts, we have very little information of what those laws were of which we find so many and so frequent complaints in our history. These rolls furnish the justification of the complaints, and from them we learn that the Forest Laws were quite as bad as they are usually represented.

Unfortunately, these rolls only go back to 1713; the older records of the Court appear to have been lost, and therefore we have only the Forest Courts in their decay; but when we see how the law was administered under the House of Hanover, we can imagine the administration under the House of Plantagenet. It would seem that the forest now known as Epping, was originally called Waltham Forest. It was for forest purposes divided into eleven walks, over each of which there was a master and under keeper. In addition to these local officers, there were also rangers to look after the venison throughout the forest, and woodwards to look after the vert. At the Forest Courts all the officers' names were called over, and those not present were fined. Those who appeared stated anything that had happened to the deer or to the wood since the previous Court; and the verderers, who acted as judges, decided what should be done in each case. As an example, we give some of the presentments as to venison at the first Court:—

"Epping Walk.—One Buck found shott, by whome knows not.
New Lodge. . . One Sorell killed by Hounds, and one Prickett shott, by whome knows not.
Chingford. . . One Hind killed by a shott, but whome knows not.
One Doe killed by a Hound; one Hind-calf killed by a Dog, but whome knows not.

Woodford. . . . Noe presentments.
Sub-rangers. . . One Haggard killed by Lady Petre's Hounds."

The following will illustrate the presentments as to vert:—

"The Under-Woodwards present James Reynolds for lopping a horn-beam in East Heynault Walk to the value of 3d.

Nythaël Waking of Coly Row, for haeving some wood on his cart to the value of 12d.

John Miller, a slid of greenwood to the value of 4d.

John Tephay, for a load of oven wood to the value of 2s. 6d.

Eliza Clifford, found with some greenwood."

Thus it will be seen that the rule was that every deer that was either killed or found dead, every load of wood, or even of sticks that an old woman might take was brought under the notice of the verderers, and the offender fined or reprimanded at their discretion.

No person was entitled to have a gun in the Forest without a licence from the Chief Justice in Eyre entitling him to shoot upon the Forest; and these licences had to be enrolled at the Verderers' Court before they had any validity. Numerous examples of these licences are found on the rolls. One to Colonel Churchill will show what they were like:—

"A Lysence signed by L^d Abingdon directed to ye officers & ministers of his Maj^{ty} Forests for Col Charles Churchill at seasonable times wth comp^{ts} & serv^{ts} to hunt hawk shoot kill and carry away all manner of Beasts & Fowle of florest Chase Park & Warren within ye limitts of ye s^d florest without lett or molestation (Red and fallow deer only excepted) for his desport & recreation only. He always first acquainting ye Keeper of ye Walk when he intends to hunt hawk & shoot therewith. Provided he use ye Lysence hereby given wth y^t moderation as is fitting dureing my L^d's will & pleasure Given und^r ye hand & seal of ye Chief Justice & Justice in Eyre ye 11th of March in ye 12th yeare of Queen Anne 1712. ABINGDOM."

For enrolling these licences the verderers charged a fee of three dozen of wine. In 1723 we find the following order passed:—

"Ordered y^t every person y^t has the permission of a Lysence to shoot hunt &c in ye florest of Waltham before he be permitted to enter ye same shall pay to ye officers at ye Court when the same shall be entred 3 dozⁿ of wine."

In order to keep the keepers up to their duty, the Court generally gave them any gun they took from persons poaching, "for their care and paines in the due execution of their office."

"The information of Henry Thompson Under Keeper of New Lodge Walk taken upon oath the 20th day of March 1720 saith that ab^t New Yeares day last past he mett Thomas Pearse in a feild adjoining to the Forest within ye s^d florest with greyhounds and spaniels and a gun with him which gun was taken away at that time by the said Henry Thompson and further saith that on fryday the 17th day of March instant he mett one Thomas Millett in Sewardstown grounds wth Mr. Pan's greyhounds and spaniels courseing or looking for a hare and Mr. Pan was not wth him.

Jurat Anno et die
supradict coram
Tho Webster.

It is ordered by the verderers of this Court present that Henry Thompson haveing done his duty in takeing away Thomas Pearse's gun have the said gun for his care and paines in takeing away ye s^d gun according to the duty of a keeper."

It also appears that the King's share of the penalty paid by persons for stealing deer was frequently given to the keepers to excite them to greater diligence.

Not only were unqualified persons not allowed to have guns, but also they were not allowed to keep dogs unless they had been properly expeditated, and we find that at fixed times the keepers were sent round the Forest to see that all dogs were duly mutilated; thus, in 1725, we find this entry:—

"It is ordered by the verderers y^t all the keepers goe round the severall walks to law all dogs according to ye florest laws y^t are kept by vnqualified persons and y^t ye Beadle doe attend them to see the same put in execution."

Occasionally the keepers seem to have made a raid upon some public house or place where they suspected dogs or guns were illegally kept; thus, we find them

"Seizing in ye dwelling-house and stable of John Pullham an alehouse keeper in Ilford within ye Liberty of the said florest 2 gunns 2 greyhounds and severall Beagles and spaniels he being a person noe way qualified or lycensed to keep the same but on ye contrary harbours and encourages divers persons who in a poaching manner shoot and destroy the game of ye said florest."

If any nets or snares were taken by the keepers, these were considered too destructive engines for the keepers to have possession of, and were ordered to be destroyed at once; thus we find in 1718 an order that "ye Toyle brought to this Court by Samuel Heybourne be burnt or cutt in pieces during the sitting thereof." But the duties of the keepers did not only extend to searching for guns and dogs, they also searched houses and premises to see if they could find any wood cut down and carried away from the Forest. In 1717 there seems to have been a grand search, and we find the following results:—

"John Barington found in his yard and House round Wood to ye value of 0. 6s. 0."

Ed Hand & Fra Richetts y^t on ye 9^o May found in ther yards one Load of Livery Wood took out of ye Forest value 0. 10. 0."

Peter Sheering of Chigwell Row 9^o May found in his yard a load of spray Wood which he took before ye day value 0. 5s. 0."

Another duty of the keepers was to prevent uncommon animals being turned out on the Forest. The uncommon animals seem to have been any that would annoy the deer; among them seem to have been geese, for we find it ordered that—

"Ye Beadle of the Forest give notice to ye poor people adjoining to ye forest to keep their geese near to their Houses and not to let them ramble upon the Forest otherwise to shoot them."

To assist the keepers in looking after the Forest, in every parish officers known as Reeves were appointed, whose duties will be seen from the oath that the Verderers' Court administered to them upon their appointment:—

"You shall swear that you will well and truly execute ye office of a Reeve in ye parish of — in ye forest of Waltham you shall drive and assist ye florest^r in driveing ye florest as often as ye Laws direct or you are thereunto required You your selfe shall not Surcharge nor see or suffer any pson to Surcharge or putt any Vncomonable cattle Vpon ye said florest But you shall be of good behaviour your selfe towards her Maj^{ty} Wild Beasts and ye vert of ye same florest

you shall not conceal ye offence of any pson whatsoever either in vert or Venison that shall be done within your charge But shall present ye same at ye next Court of Attachments or Swainemote which shall first happen to be holden for ye same florest And you shall to ye Vttermost of your power maintain and keep ye assize of ye florest and in all things ye Queens right defend concerning ye same soe long as you shall be Reeve there so help you God."

The reeves marked all the cattle turned out upon the forest; each reeve had a mark for his parish, and marked the beasts belonging to it. He was entitled to a fee for all beasts he marked; any cattle not marked found upon the forest were impounded by the reeves. This seizure of cattle gave rise to frequent disputes. Thus in 1718 we find the beadle of the Forest presenting Edward Jones, of Heatford, for assaulting him and pulling him off from his horse, and taking "his, y^e said Jones', horse out of y^e pound." There were fixed days upon which all the cattle were to be marked—May 1 and 2, July 10 and 11, September 2 and 3, November 7 and 8.

At the time the deer were breeding it was necessary that all the cattle should be removed from the Forest; and for a month in the summer, that is, a fortnight before and a fortnight after Old Midsummer Day all the cattle were removed from the Forest. This was called the "fence month." On the day fixed for it to begin, the officers of the Forest assembled and drove the Forest, that is, caused all the cattle to be turned off.

In 1721 we find an order, signed by Sir Robert Walpole, ordering certain repairs to be done in Greenwich Park, the expense of which was to be defrayed by the sale of underling and dead-topped trees from Epping Forest. Among these repairs were the planting of two hundred elms, three hundred and fifty chestnuts, and thirty-four Scotch firs. Most likely some of the fine old Scotch firs still standing in Greenwich Park belong to those then planted.

At times the stock of game and deer in the Forest got lower than it ought, and when this was the case the Chief Justice in Eyre issued his warrant forbidding any from being killed until the stock had increased. The following restraint, signed by Lord Tankerville, was issued in 1721:—

"Whereas it has been represented to me that the stock of Red and fallow deer within His Maj^y Forest of Waltham is soe very low and scarce that if the said Forest be not spared they shall never be able to run again. Therefor to prevent a totall ruin and destruction of the said Deer & Game & as the best & most expedient way for the increase & preservation of those few deer & Game that are still within the s^d Forest I have thought fitt and doe hereby order and appoint that a generall restraint of His Maj^y Deer & Game shall be & continue for 3 years next ensuing the date hereof."

Another subject of jurisdiction of the verderer was the number of ale-houses in the Forest; no Forest officer without the verderer's leave could keep an ale-house, and this leave they seem to have been very chary in giving. Indeed, their authority seems in the matters in which they had jurisdiction to have been very nearly absolute. The Swainmote Court to which appeals lay from them seems to have never been held, and the only controlling authority was the

Chief Justice in Eyre, who could do as he liked within the Forest; the ordinary rules of law do not seem to have applied; they were governed by their own courts, not by the ordinary courts of the land; and the Forest officers seem only to have been responsible to the Forest courts. Property was held subservient to the Forest rights. The forestal rights of the Crown were to be maintained at all price, regardless of the injury that their maintenance might inflict upon individuals or their property. From what we see of their operation in these volumes during the eighteenth century, we can easily believe any amount of oppression having been done under their authority in the thirteenth century. The remark of Mr. Allen was equally true one hundred years ago as it was eight—that a forest was an oasis of despotism in the midst of the Common Law.

J. W. WILLIS BUND.

Mary and Charles Lamb: Poems, Letters, and Remains. Now first Collected, with Reminiscences and Notes. By W. Carew Hazlitt. (Chatto & Windus, 1874.)

It cannot be said that this volume disappoints any reasonable expectations raised by the title-page: it contains a collection of poems, letters, and remains, which has not been made before, if that be a sufficient reason why this particular collection should be made and published now. It is true that more than one collection of the like character might be made; indeed there is no limit to the number of volumes in which the lovers of Lamb might be compelled to search for information about him if every editor of an essential portion of his correspondence were to select at random from familiar or inaccessible sources a different set of parallel passages, illustrative notes, and companion fragments. But such outbursts of literary enterprise are not an unmixed evil while the publication of a final, exact and complete edition of the letters of both brother and sister is still delayed, and Mr. Hazlitt might even have established a claim upon our gratitude if he had brought together, as a supplement to the very interesting letters of Mary Lamb to Miss Stoddart (afterwards wife of William Hazlitt, the essayist), all such letters or *notelets* of Charles Lamb as are not to be found in either of Talfourd's series, nor in the one volume of the *Complete Correspondence and Works of Charles Lamb, &c.*, published by Moxon in 1868, under the editorship of Mr. G. A. Sala. So far as he has done this, the work is at least provisionally useful, and if occasionally an old friend, like the letter to Mr. Patmore about Dash, makes its appearance without any reason in particular, one is not seriously disposed to complain of the editorial inadvertence that reminds us of the expression of Lamb's humane anxiety for the welfare of the dog's adopted family: "Goes he muzzled or *aperto ore*? Are his intellects sound, or does he wander a little in his conversation? . . . Try him with hot water. If he won't lick it up, it is a sign he doesn't like it. Does his tail wag horizontally or perpendicularly? That has decided the fate of many dogs in Enfield. Is his general deportment cheerful? I mean when he is

pleased—for otherwise there is no judging. You can't be too careful. Has he bit any of the children yet? If he has, have them shot and keep him for curiosity, to see if it was the hydrophobia," &c. The letter is given at length by Talfourd, though Mr. Hazlitt refers to P. G. Patmore's *My Friends and Acquaintances* as the authority for it.

There is not much to be said in favour of the original part of the volume. Mr. Hazlitt complains that former biographers, especially Talfourd and Barry Cornwall, were wanting in cordial sympathy for their subject, and dishonestly glossed over real traits which they stupidly supposed to be discreditable; and his indignation against them seems to overflow into a curious disposition to put the most unfavourable construction possible on whatever is ambiguous or uncertain in Lamb's life and character. On most points he is clearly wrong; on some inexcusably so; for instance, he places the one attack of insanity from which Charles Lamb is known to have suffered "in the winter of 1796-7," and connects it with the tragic event that determined the course of his life. It is, however, in a letter to Coleridge, in the spring of 1796, that the passage occurs to which all biographers refer:—"The six weeks that finished last year and began this, your very humble servant spent very agreeably in a madhouse at Hoxton." A few months later he recurs to the subject, and tells Coleridge not to dream of having tasted all the grandeur and wildness of fancy till he has gone mad; but to the same correspondent, in giving an account of the calamity (Miss Lamb, in a fit of insanity, stabbed her invalid mother), he observes that his own mind remained strangely calm and collected. "I felt," he adds, "that I had something else to do than to regret;" it is scarcely possible to avoid agreeing with Talfourd that the entire preservation of so delicately balanced an intellect may have been due to the constant presence of an intense sense of moral responsibility for the care and happiness of his sister. In spite of Mr. Procter's direct denial of the truth of the report, Mr. Hazlitt is inclined to believe, on the strength of Mr. S. C. Hall's *Recollections of Literary Persons*, that Lamb was placed under restraint shortly before his death. A reference to his published correspondence would have sufficed to prove both that Mr. Hall was mistaken, and how his mistake may very naturally have arisen.

In 1829 Lamb and his sister "cast off the cares of housekeeping" in the "gambogish" cottage at Chase-side, Enfield, where they had settled some two years before, to escape from the incessant interruptions of visitors in Islington ("a plaguy suburban midspace, fitted to catch idlers from town or country"), and began life anew as "confiding ravens," at board and lodging with Dame W(estwood) and her husband, the latter (old T—W—) known to fame as the haberdasher who retired from business upon the competency of 40l. a year and one anecdote. In the spring of 1833 Lamb removed finally from Enfield to Edmonton, where he died, before all his less intimate acquaintances had become familiarised with the change, for one of the last letters he wrote, to a Mr. Childs, is dated "Monday,

a common link. A, B and C make a party. A dies, B not only loses A, but all A's part in C. C loses A's part in B, and so the alphabet sickens by subtraction of interchangeables."

Of course, Lamb's biographers were not a necessary part of his later life in the sense in which these friendships, strengthened by common memories even more than by similar tastes, were a part of his earlier manhood; but it is clear that he liked them both quite well enough to feel sure that they were not stupid so far as he was concerned, writing to them always as the mood of the moment prompted, and only leaving it open to conjecture that perhaps he might not have cared enough about them to write on any other terms. The best proof of the "entire cordiality" between Elia and his juvenile admirers is to be found in the frank *brusquerie* of some of his phrases; for instance, in a letter to Procter, beginning "Dear Lad," after acknowledging, in delicately appreciative terms, the present of a miniature of Pope, he ends, "Why did you give it me? I do not like you enough to give you anything so good." The genius of amiability is wanted to give such a confession the flattering effect that we cannot doubt its having duly produced on the recipient.

The part or aspect of Lamb's life which Mr. Hazlitt accuses preceding biographers of having glossed over or distorted is that side which he (in this agreeing with them) is inclined to call *ungentle*. It is true that the descent and habits of the Lambs were more akin to those of the lower section of the middle class than was usual amongst men of letters at the beginning of this century. Elia was born in 1775, and one great attraction of his early reminiscences is that they take us back to a date when the gulf between the kitchen and the parlour was narrower than at present; but their interest is by no means merely archaeological; the materials out of which he built the life that his fancy could rest upon with content had perhaps a quaintness, a pleasing primitive simplicity that has since been lost; but we can scarcely imagine a set of social conditions so empty and uncongenial as to yield no elements of beauty under his whimsically affectionate handling. Dwelling on the homeliness of the surroundings he not only tolerated but enjoyed, serves to heighten our impression of the range of his susceptibilities; no doubt the flow of Coleridge's eloquence was most entrancing on the wooden benches of the Salutation and Cat; and the fact that in after years Lamb entertained his guests with "gin and mutton," rather than more aristocratic fare, did not prevent Talfourd from comparing his "Wednesdays" with the dinners at Holland House, as the only other social circle that could rival his in brilliancy. Another point in which Mr. Hazlitt is over hasty to disparage his hero is in accusing him of fickleness, and especially of neglecting Coleridge in his later years; their intercourse was less constant as both grew older, and Lamb's private troubles heavier, but it never changed its character; as indeed appears from one of a series of letters or notes to Allsop, now first reprinted from an American magazine. A postscript to a note about 1829 runs: "How

you frightened me! Never write again, 'Coleridge is dead,' at the end of a line, and lamely come in with 'to his friend's' at the beginning of another. Love is quicker, and fear from love, than the transition ocular from line to line." It is a more venial misrepresentation to make Lamb (when his sonnet "The Gipsy's Malison" was declined by an editor) do anything so prosaic as propose to write for *posterity*; according to his own account he exclaimed, "Hang the age, I will write for *antiquity*!" a characteristic example of the effect to be got by confusing two trains of thought, or rather neatly substituting one for the other midway in a brief sentence.

Gilray's caricature of Coleridge, Southey, Lamb and Lloyd is referred to more than once as reprinted in this volume, where, however, we seek it in vain. Lamb was represented as a frog, Lloyd as a toad, but it is generally reported as an instance of Godwin's want of tact and courtesy, that he asked Lamb in their first interview which of the two he was; but as those who were best able to know give different accounts of the way the question was put, all that seems certain is, that Godwin made some reference to the caricature, which was natural enough at the time, but is not of much interest or importance now. We do not gather that Lamb was in any way disturbed by the attack, but there can be little doubt that it suggested a passage in one of the stories which he contributed to his sister's book, *Mrs. Leicester's School*, published ten years later (in 1808), a curious instance of the permanence of all his impressions, including the slightest. In "The Witch Aunt," the little girl who tells the story is made to say in self-criticism, "Doubtless a frog or a toad is not uglier in itself than a squirrel or a pretty green lizard; but we want understanding to see it." A sentiment which the sage governess approves, with slightly humorous reservation. Besides the letters already alluded to, the volume contains Mary Lamb's poems for children, the sturdy quaintness of which should save them from oblivion; vignettes of different houses inhabited or frequented by Lamb; fac-simile title-page of his early works (a peculiarly useless kind of illustration), and a fac-simile of the first pages of the essay on Roast Pig. Better editing would perhaps have produced a volume too small to be saleable.

EDITH SIMCOX.

Essays in Modern Military Biography. By Colonel Charles Cornwallis Chesney, Royal Engineers. (London: Longmans, Green & Co., 1874.)

We learn from the first page of the volume whose title is given above, that its contents are chiefly reprinted from the *Edinburgh Review*.

To review a series of papers which are themselves more or less criticisms on other works is not a very easy task at any time, and the author has made it still more difficult by giving, in the form of a preface, a concise summary of the lessons which he has tried to inculcate by his essays, which is itself a perfect though brief review of his work.

The British army may be deficient in many respects, as it undoubtedly is in numbers, to its continental rivals, but it can boast in Colonel Chesney a military critic who has certainly no superior, perhaps no equal, in Europe since the death of the late Colonel Charras. To weigh in a just balance the causes which lead to success or defeat in warfare is possibly more difficult than in the kindred game of politics, especially where the writer's own fatherland is concerned. The natural leanings of patriotism are easier to overcome in recounting the results of an exchange of protocols than of cannon-shots. It is difficult for an ordinary mind to imagine a temperament so perfectly imbued with the critical spirit as to be able to take an absolutely impartial view of his country's battles. To exalt the prowess of a beaten enemy is but another form of self-gratulation. To award a fair share of glory to the ally by whose aid the battle was won is not so easy. No higher praise can be given to Colonel Chesney's history of the three days' campaign of 1815 than to chronicle the fact that, though it did not in any way detract from the prowess of the British soldier, it extorted universal approval from foreign military writers, Prussian as well as French.

In these slighter sketches we find the same freedom from prepossession, and the same effort after truth, combined with sound judgment, and clear simple language, which have made the lectures on Waterloo a textbook to the military student both on the Continent and in the author's own country.

The first two essays, which occupy about a fourth of the volume, are perhaps the most interesting to the general as to the military reader. Both are reviews of memoirs of personal experiences during the later wars of the first Napoleon, by men who took an active part in them. One, a Frenchman and an aristocrat, later on the Duc de Fezensac, after spending eight months in the ranks of an infantry regiment, rose rapidly through the commissioned grades, partly by courage and ability shown on constant service in the field, but more by powerful protection, till he surrendered his sword at Dresden in 1814, a general of brigade, after ten years passed in campaigning all over Europe. The other, General von Brandt, though he afterwards rose to distinction in the Prussian service, quitted the French army as a simple captain. His story is a curious exemplification of the motley crowd of nationalities that followed the eagles of Napoleon. A scion of a noble Prussian family which had emigrated to the territory acquired by the Hohenzollerns at the partition of Poland, Von Brandt first saw life under the colours as an ensign in a provisional battalion raised in East Prussia after Jena. But before he had an opportunity of active service, the province to which his father had emigrated ceased to be Prussian, and with hundreds of thousands of other pure Germans he found himself, as an inhabitant of the new Grand Duchy of Warsaw, a subject of France in all but the name. Disappointed in an attempt to obtain re-employment in the Prussian army, he was unexpectedly nominated to a commission in the newly raised Legion of the Vistula, which afterwards earned a reputation second to none among

the legions of France. In its ranks he saw much active service in Spain under Suchet, the only successful lieutenant of Napoleon in that country. We then find him one of the fortunate survivors of the fatal retreat from Moscow; and the next year a wounded prisoner in the hands of the Russians at Leipzig, after which he was permitted to return to the service of his own country. Beside the light which is thrown upon the military history of the time by these memoirs, Colonel Chesney, in words which we cannot help quoting, draws attention to the reasons which Von Brandt gives for the easy acquiescence of the Poles in their transfer from Prussia to France, reasons which might profitably be taken to heart by the present masters of Alsace-Lorraine, and the persecutors of recalcitrant Polish bishops, as well as by those nearer home at whom Colonel Chesney seems to hint:—

“Focus of Napoleonic intrigue, debateable land between the aggressive Frank and unyielding Muscovite, Poland had had for years to bear much of the pressure of war without its excitement or its glories; and now, as forming the base from which the grand army was to move to its greatest enterprise, the burden lay doubly heavy upon her. Yet no one complained of the government, or threw the odium of crushed trade and exhausted means on French domination. No one expressed a wish to have the Prussian rule restored in Posen. . . . The grand-ducal government was national and popular, because it was felt to sympathise with its subjects. This is strange testimony to gather from a Prussian pen; but it is more striking still, and may bring a lesson to other rulers than the counsellors of the Hohenzollern, to find from such unbiassed authority that the reasons of this strange and complete acquiescence of the Poles in the revolution which had overthrown their late masters, lay in the intense dislike entertained towards the Prussian officials, with their cold, rigid measurement of Polish inferiority, their zeal for forcing improvements, and education of a strictly North German type upon a country unprepared to receive them; in short, what Brandt, seeking for a single word, calls *Borussomania*, which had led his countrymen, during their years of possession, to strive to bring the whole of the institutions of their conquest into the exact mould of their own. It was not what Prussia had desired to do for Poland, but the manner of her doing it, which had made her Government so obnoxious, that, amid the standing exactions caused by protracted preparations for war, none regretted the change of rulers.”

From the records of the personal experiences of the two writers whose memoirs he has abridged, different as they were in thought, country and education, Colonel Chesney deduces the same conclusion, that the overthrow of Napoleon's power was as much due to internal as to external causes. In a word, want of sound discipline was then, as in 1870, the cankerworm which sapped the vitality of the French army. Moreover, Colonel Chesney considers it proved

“that the present habit of depreciating the French military character, and ascribing German successes to innate superiority, though carried to extravagance, is more reasonable than the belief in French invincibility which was as commonly entertained in the earlier days of the first Empire.”

An admirable essay on Lord Cornwallis and the Indian services, showing how he successfully combated corruption, the hydra which threatened to destroy our Oriental

empire while yet in its cradle; a curious and interesting memoir of a Carolina loyalist in the revolutionary war; a brief biography of Gordon, of Gordon's Battery, the Bayard of the British army, if ever man deserved the title; and an account of the Taiping rebellion, and its extinction by the “ever-victorious army” under “Chinese” Gordon, occupy the middle of Colonel Chesney's book. But we must pass them without remark to fill the rest of the brief space allotted us with a short notice of the four concluding essays, which, under the titles of “Memoirs of Generals Grant and Lee,” “The Story of a Northern Raider,” and “The Navy of the Union,” give in a couple of hundred pages a history of the War of Secession which leaves little to be desired. It was, we believe, General von Moltke who said, or is reported to have said, in reply to a query as to the military lesson to be gained from the struggle of North and South, that “nothing could be learned from the mutual slaughter of undisciplined mobs under civilian generals,” or words to that effect. From this taunt Colonel Chesney vindicates at least the generals on both sides, and shows, moreover, that while want of discipline was to the last a grave fault in the army of the South, that of the North had in the last two campaigns attained a solidity which, though never reaching the European standard, contributed much to its final triumph. He takes, however, the opportunity of pointing out, from the experience of the battle of Bull's Run, and from that of the Army of the Loire ten years later, how little dependence is to be placed on untrained troops, especially after their first attack has proved unsuccessful. Let us not deceive ourselves:

“What is true of Frenchmen, Swiss, and our own kith and kin in America, would hardly be falsified if misfortune fell on ourselves.”

To General Grant's discovery early in the war that, after an indecisive action between half-trained troops, the commander who first attacks is sure to win, are attributed many of his early successes, and to his persistence in similar tactics against the hardy veterans of Lee, much of the appalling slaughter suffered by the Northern army in the closing campaigns of the war. His final success was due to his abandonment of this bull-dog fashion of fighting, and also to the unfortunate political reasons which prevented his opponent from quitting Richmond until too late. Altogether Colonel Chesney places Grant among modern generals in a much higher rank than any but Northern writers are disposed to allow, while for the pre-eminence of his antagonist, General Lee, both as a man and a commander, he endorses all that can be said by his warmest admirers.

The essay on “The Navy of the Union” shows that sufficient credit is never given to that branch of the service in bringing about the successful result of the war. Nevertheless, marvellous as were the energy and resources brought to bear by the North in the creation of a navy, it cost years of preparation and millions of expenditure before they could effectually blockade the Southern ports and sweep the flag of rebellion from the seas, thoroughly as it was eventually done. The Americans then boasted that no European fleet equalled their own in fighting power.

Nine years have not elapsed since the close of the war, yet we now find them acknowledging officially, that not only are most of their ports at the mercy of a powerful navy like our own, but that even despised Spain, had she chosen to fight, and been able to find an admiral, might last year have laid New York in ruins, and inflicted on the United States a humiliation not to be wiped out by the possession of twenty Cubas. Is it necessary to draw a moral from this?

O. ST. JOHN.

A Summer in Spain. By Mrs. Ramsay, Author of *A Translation of Dante's Divine Commedia*. (London: Tinsley Brothers, 1874.)

SPAIN has for very many years been a favourite field for excursionists and book-makers from other parts of Europe. Enumeration of the volumes of European travel published from time to time during the past century might well result in amazement at the number dedicated to this country of lofty associations. One cause is manifest. The spirit of chivalry and romance pervades all Spanish history, and throws light on even its darkest periods; and though intrigue is the main staple of her most popular plays and fictions, yet it is of such a cosmopolitan and comprehensive kind as to become a real boon to literary aspirants in quest of stirring plots and dramatic incidents. Some may reasonably argue that the Dons and Duennas, the Alkalds and Alguazils, have had their day, at least on the stage. But may it not be truthfully returned that our Thalia is not the very Muse of our ancestors; nor does our approved modern *répertoire* afford proof that her taste is unimpeachable. Besides, we have in London witnessed a very recent revival of Beaumarchais; and Mr. Irving is delighting his audiences at this hour with a Spanish portrait.

But Spain, in the abstract, has not lost her attractions to the outer world. Even in the present days of anarchy and revolution, the British traveller takes advantage of her railways and coaches to visit and explore the scenes of ancient *prestige* and interest. Madrid, Seville, Cordova, Granada, Toledo, and other and equally well-known cities, are described anew and anew; and the same old palaces, monuments, and pictures are reproduced and rediscussed, in 1874, with a *verve* and freshness quite surprising. More than fifty years ago Mr. Robert Semple had published his *Second Journey in Spain*, going over much the same ground as the lady whose book heads this notice. And about the same time appeared the translation, in five volumes, of *A View of Spain*, by M. de Laborde, member of a Paris banking-house which had, as we are informed in the *Annual Register* (1809), published his *Voyage Pittoresque de l'Espagne*, much in the hard practical fashion of our own age, “as a commercial speculation.” So on from year to year, the subject has been found inexhaustible.

Mrs. Ramsay's *Summer in Spain* is the narrative of a six months' tour in both autumn and summer of 1872. Leaving Biarritz, and crossing the Bidassoa in May, she proceeded through Zumarraga to Burgos, thence by Valladolid and Avila to

Madrid. From the capital two excursions were made in the month of June—one southwards to Toledo, and one by *diligence* as well as rail to Segovia. The next move was on July 1 to Granada, and in this city, Cordova, and Seville, the summer was fairly expended. Seville was left for Cadiz on September 30; and thence Algesiras and Gibraltar were inspected, and a visit was paid to Tangiers on the opposite coast. Malaga, Valencia, Tortosa, Tarragona, Barcelona, and a few more places, complete the record of a peregrination accomplished chiefly by rail and steamer, but to some small extent in a *diligence*.

The landing at Tangiers is a good specimen of the author's style, and Mrs. Ramsay is doubtless not the only lady, or gentleman either, on whom a realization of the Emperor of Morocco would produce a startling effect, as of something quite unexpected, if at all susceptible of credit. She is describing a pull on shore in an Arab boat:—

"We soon got under the lee of the long low point that does duty for a breakwater; and now, as it grew shallow, wild-looking Arabs rushed into the water, seized us, and carried us to shore. We felt as if we were being carried off by pirates; but they were very careful, and put us down safely on the slippery stones. A splendid, white-turbaned Moor, strongly resembling Solymán the Magnificent, stepped forward, and in perfectly good English announced himself as Muhammed, the interpreter of the Victoria Hotel. But first we must go to the Custom House. 'What Custom House?' said I, bewildered, not expecting that disagreeable feature of civilisation in the land of Ham. 'The Emperor of Morocco's,' was the overwhelming reply. Now, the Emperor of Morocco had always appeared to me a semi-fabulous potentate. I knew he existed; yet, ever since childhood, he had occupied the same place in my imagination as Jack the Giant-killer, the Great Mogul, ogres in general, and such like. So now it was startling to find he had a custom-house, like ordinary mortal sovereigns."

Mrs. Ramsay is enthusiastic on the Alhambra, describing it as "the one thing on earth in which disappointment is impossible—the Great Wonder of the World." Its size and perfect preservation seemed to her especially remarkable:—

"We had expected to see an exquisite little ruin; instead of which, here was a very large palace in excellent repair. In a week it could be made habitable, and perfectly comfortable; and as to size, besides the great Hall of Ambassadors, there is the Court of Myrtles, a hundred and fifty feet long; and the Court of Lions, more than a hundred; and yet they look small compared with the whole. The restorations are now most skilfully made; the greatest attention being paid to correctness in the Arabic inscriptions. This was not formerly the case."

Upon the whole, this is a pleasantly-written book, chatty, and well-suited to good-humoured and not over critical tourists, who might not unreasonably prefer it for occasional reference, to Murray as a settled study. For some people the Guide-Book is of too stereotyped a character, and independent personal narrative has greater attraction. Irrespectively of the Alhambra, to which many pages are devoted, there are several objects which arouse the writer's admiration; among them the palace of Abdar-Rahman, or Azzahra (p. 240). Without presuming to dispute the theory that the name of this

magnificent structure (orange-blossom) indicates that there were oranges in Spain in the days of the Khalifs, we apprehend that the original Arabic word has rather a generic than particular signification; and Freytag, commencing his analysis of "Zahrat" with "Planta ejusque flos," concludes with "Inde pulchritudo, nitor, splendor mundi." Hence, moreover, the Oriental name of Venus.

F. J. GOLDSMID.

Calendar of State Papers and Manuscripts relating to English Affairs existing in the Archives and Collections of Venice, and in other Libraries of Northern Italy. Vol. IV. 1527–1533. Edited by Rawdon Brown. Published by the authority of the Lords Commissioners of Her Majesty's Treasury, under the direction of the Master of the Rolls. (London: Longmans & Co. and Trübner & Co., Paternoster Row, 1871.)

MR. RAWDON BROWN's fifth volume of Venetian Documents has already made its appearance, and we shall take an early opportunity of noticing it. Meanwhile we shall offer a few remarks upon the fourth, which has been published more than two years, and has not attracted as much attention as it deserves. These volumes of Venetian Despatches are second in interest to none in the series of publications issued by the Master of the Rolls—unless, indeed, an exception be made in favour of the enormous collection of Letters and Papers derived from so many different sources which has now for ten or twelve years past been progressing under the editorship of Mr. Brewer. Comparisons are proverbially invidious; but if Mr. Rawdon Brown's volumes do not come up in interest to Mr. Brewer's, it has to be remembered that the editor of the Venetian Papers is working single-handed upon a distinct portion of a mine, nearly the whole of which is open to Mr. Brewer's investigations, and that this latter editor has a large staff of assistants, and lives in the midst of books of reference. In one respect, however, the Venetian Despatches possess an advantage which is wholly wanting in other State Papers written by the principal agents in the transactions described. In diplomatic letters of this kind, the reader has to judge for himself how far he may believe the writer; but in descriptions of English affairs by a Venetian ambassador at the English court, it may generally be taken for granted that there is no intention to deceive. The interests of the ambassador and the Court from which he comes are nearly identical. He will not be endeavouring to mislead his employers; and his descriptions will have all the value which naturally attaches to the narrative of an unprejudiced witness, excepting, of course, so far as the transactions carried on are between the Court from which he comes and that to which he is accredited.

Now, as regards the period to which this volume refers, Venice plays only a subordinate part in the great event which was fraught with such momentous consequences to England; and yet the additional information given us as to the details of the case for the divorce of Catharine of Aragon and the marriage with Anne Boleyn is of the most interesting kind. And it is

the more interesting as it confirms much that has come to light of late years, both from papers in our own Record Office and from the Vatican. The *Records of the Reformation* supply us with the former. M. Theiner, in his *Monumenta Vaticana*, gives us a specimen—and we regret to say, a specimen only—of the countless treasures which he might have produced from the Papal library.

There is another value which such collections of foreign documents possess. They sometimes supply gaps in the series of English State Papers which have arisen from various causes. Our own Public Record Office is seriously deficient in papers of the reign of Henry VIII., owing to the fact that so large a number of letters has found its way, whether by fair or foul means, into the Cottonian Library. It is fortunate that most of these have been preserved, though many are badly mutilated; but where both these collections are at fault, the deficiencies are occasionally supplied from foreign sources.

There is one document in the volume which we are now reviewing which serves to illustrate this remark, though it is not exactly a case in point. Mr. Rawdon Brown has given an English re-translation of an Italian version of the Proclamation of July 5, 1533, for the recognition of Anne Boleyn as Queen. The editor was perhaps not aware that there is a copy of this Proclamation in existence, belonging to the Corporation of Norwich. How it found its way there it is impossible to say; but, being there, it deprives the Venetian translation of the value which it would otherwise have had. It is very remarkable that so important a document should not be either in the Record Office or in Sir Robert Cotton's collection; and, unless it had been found at Norwich, we should have been indebted to a Venetian collection for a knowledge of its contents. And, indeed, we are actually indebted to Mr. Rawdon Brown's volume for the date, as the printed Proclamation at Norwich is without date. It was first printed in the *Archæologia*, and has subsequently been inserted in the *Records of the Reformation* with a conjectural date of the preceding month.

As we have already implied, the "Divorce" is the principal point of interest in the volume. But there is one remarkable document which deserves special attention for the correct estimate that is found in it of the leading characters of Henry's court, and the change of character that came over the king himself after the loss of his guide and counsellor the illustrious Cardinal of York. It occurs in the analysis of the speech of Lodovico Falier to the Senate, Nov. 10, 1531, on his return from his embassy in England, where he had resided three years. It was the custom for Venetian ambassadors to make a formal speech, detailing what they had seen and heard in the country which they had just left, and several of these valuable documents have been preserved. We pass over the description of the country, geographical and political: the important part is the delineation of character which it contains. One curious feature in it is the omission of all notice of Cromwell, whose influence had already begun to tell upon the king. Falier seems to suppose that the whole management of affairs was with the

Duke of Norfolk, whom he describes in the following words:—

"His Excellency the Duke of Norfolk is of very noble English descent. His Majesty makes use of him in all negotiations more than any other person. Since the death of Cardinal Wolsey, his authority and supremacy have increased, and every employment devolves to him. He is prudent, liberal, affable, and astute; associates with everybody, has very great experience in political government, discusses the affairs of the world admirably, aspires to greater elevation, and bears ill-will to foreigners, especially to our Venetian nation. He is 58 years old, small and spare in person, and his hair black. He has two sons."—P. 295.

The conclusion of Falier's report shows how true an estimate he had formed of the position of affairs in 1531, whilst it also contains the earliest piece of information that exists as to the mode in which the suggestion of the divorce originated. He speaks as if there could be no doubt, of what the sagacity of Lingard had conjectured without having seen this document, viz. that the Cardinal had suggested to the French ambassador to insinuate a doubt as to the legitimacy of the Princess Mary, and the validity of the marriage of Henry with her mother. He then goes on briefly to detail the method in which Wolsey had endeavoured to manage the affair with the Pope; and how, finding he could not manage the matter his own way, and fearing that Anne Boleyn's father and uncle would oust him from the government, he had deceived the king with fair words till the arrival of the letters from Rome which suspended the cause, so that everything now was at sixes and sevens. There is no contemporary estimate of the situation of affairs that will bear comparison with the Venetian ambassador's, on the score of accurate measurement of motives and intentions.

In the early notices of the divorce, there is a remarkable unanimity amongst the ambassadors at the different courts of Europe, as to the fixed determination of Henry to repudiate Catharine, though for many months afterwards the king persisted in asserting that all he desired was the satisfaction of his conscience, whatever way the matter should be decided by the Pope.

Our limits do not permit even the briefest history of the abortive mission of Campeggio, or the diplomatic transactions which immediately preceded it. But we may observe that the trial in the Legatine Court in June and July 1529 is minutely and graphically described by Falier, who was himself an eye-witness of the whole transaction. And the papers which appear in this volume, being of course arranged in chronological order, give us a very interesting view of the proceedings which were simultaneously going on as to the trial in England and the Pope's advocacy of the cause to Rome.

At this stage of the proceedings these Venetian Papers give us a clear view of the unanimity of opinion prevailing throughout foreign courts, that the king had already determined, if the Pope would not grant the divorce, to take his own course, and get rid of his wife for the sake of placing "the favourite," as she is called, on the throne.

There is also a great deal of light thrown upon the transactions instituted to secure

the votes of foreign divines and universities in favour of the divorce. Much that was formerly unknown has recently been brought to light upon this subject; and the unwillingness of the authorities of Venice to connect themselves with the matter, or allow anybody under their jurisdiction to give his opinion on it, is copiously illustrated in this volume.

Perhaps it is hardly necessary to caution students of history against placing too implicit confidence in assertions made in letters from people living at a distance as to what was going on in England. Of course reports are not trustworthy unless they are made by eye-witnesses; but they may have their own value nevertheless, as showing indirectly what was the general opinion of the day.

We gather from several incidental notices that the general opinion in England was distinctly adverse to the divorce, a point which has been denied and kept in the background by Protestant historians. That it was so may be inferred from many other considerations, and especially from the following grossly exaggerated description, written November 24, 1530, by the French ambassador at Venice:—

"More than seven weeks ago a mob of from seven to eight thousand women of London went out of the town to seize Boleyn's daughter, the sweetheart of the King of England, who was supping at a villa on a river, the king not being with her; and, having received notice of this, she escaped by crossing the river in a boat. The women had intended to kill her, and amongst the mob were many men disguised as women, nor has any great demonstration been made about this because it was a thing done by women."—P. 304.

As to the point of Anne Boleyn's chastity there were various reports, some of them stating that she was pregnant, but nearly all agreeing in the probability that she might any day become pregnant. Her creation as Marchioness of Pembroke, September 1, 1532, is duly narrated, and we gather from the different accounts given that the object of the subsequent visit to France was to enlist the sympathies of the French king in favour of the marriage, and that Henry could not prevail upon Francis openly to sanction the proceeding. Whether the marriage took place, as Sanders says, November 14, 1532, on their arrival at Dover, or whether it was deferred, as Cranmer supposed, to January 25, 1533, still remains uncertain.

In conclusion, we may say that Mr. Rawdon Brown has somewhat disparaged the value of his work when he says that it does not add much to our stock of information as regards the history of the Divorce. On the contrary, we are of opinion that it has added much to what was known before the publication of Theiner's *Monumenta* and the *Records of the Reformation*, and that its chief interest lies in its fitting in so well with these more recent publications, and throwing light upon much that even in them had been left somewhat doubtful.

NICHOLAS POCKOCK.

M. LEGOUVÉ has had a great success in the literary circles of Amsterdam, Rotterdam, and Leyden, with his *conférences* on Scribe and Henri Quatre.

Ribblesdale, or Lancashire Sixty Years Ago. By Sir James Kay-Shuttleworth, Bart. In Three Volumes. (London: Smith, Elder & Co., 1874.)

SIR JAMES KAY-SHUTTLEWORTH, who, during a public life of fifty years, has been distinguished for his laborious attention to the cause of education, is not the man from whom one would expect a love-story in three volumes. When the novel of *Scarsdale* appeared, its bold and vigorous pictures of the bygone condition of Lancashire and Yorkshire excited much interest, and it was generally attributed to Sir James Kay-Shuttleworth; but the authorship was not publicly acknowledged until the appearance of its companion and successor, *Ribblesdale*. The two works have many points in common. They both deal with the same class of human material, but in *Ribblesdale* we miss those portraits of real individuals which, in the former, were easily recognised under a very thin veil of fiction. We are sorry not to have been favoured with some more of those lyrics in the East Lancashire Doric which gave an additional charm to *Scarsdale*.

The plot in *Ribblesdale* turns upon the antagonism between the ancient gentry and the families enriched by commerce. This horror of a *mésalliance* is embodied in the person of the Dowager Countess de la Legh, a lady of Corsican birth, who is not withheld by any vulgar notions of morality from doing whatever she deems necessary to preserve from all plebeian taint the blue blood of her husband's house. In her efforts to avert this threatened evil she weaves a tangled web of deceit and machination, and in the end is taken in her own toils, sees all that she has laboured and sinned for brought to nothing, and dies in a dignified aristocratic manner by the aid of a poisoned ring.

The plot is too complicated to be given in a few lines, and it is less necessary to do so as the value and interest of the book depend not so much upon the fable, which is indeed sensational, but upon its pictures of the social life of Lancashire and its character sketches.

The Dowager Countess de la Legh is a novel creation. She lavishes much affection upon her children and dependants, and yet ruthlessly wrecks their happiness to maintain the honour of the house, the grim idol, worshipped with pagan devotion, to which she offers up in sacrifice even those whom she most loves.

In the heroine, Alice Hindle, strong religious feeling acting upon a highly cultivated mind has made a charming Lancashire Witch, "who moves amongst her father's workpeople like a pitying angel, striving to mitigate the bitterness of their lot in those times, alike inevitable and unforeseen, when Want and Famine stalked grimly in their midst." Exceedingly life-like is the picture of the Relief Committee, presided over by Alice, and composed of leaders of the various dissenting sects, to whom are afterwards added two publicans, and "Volney Pate, t' Radical, an' Tom Paine Helm as is nother saint nor sinner, but they'r'n t' Wavers Union secretaries."

The opposition to her marriage with Rufus Noel, who at one time is looked upon as the heir of the De la Legh peerage, gives rise to the chief incidents of the book. Has this feeling against the union of blood with money ever attained to the intensity which our author represents? Speaking of "noblemen of the highest rank and greatest social power" who had married out of their own rank, he says—

"But if they had not paid the whole penalty of the transgression, they had suffered embarrassment. Their countess or marchioness—whatever her beauty, grace and accomplishments—how spotless soever her honour—could not bring from the city, or from the fame of the greatest genius in art, enough to compensate for rank."

At the time to which this passage refers there were several actresses who had been "raised to the peerage," and the history of most ancient English families, however noble and exclusive, will show a frequent infusion of new blood from plebeian sources. Hogarth's *Marriage à la Mode* would have lost all its satirical force if the ranks of the aristocracy had not been susceptible to the influence of money-bags.

John Spencer, the poor Lancashire weaver-boy, whose native force leads him to a course of self-education, in which he overcomes many and great difficulties, is a character which has had many parallels. The narrative of his search after mental food is very interesting, and to those who know how common are such cases of the pursuit of knowledge under difficulties, it loses none of its interest from the transformation scene which converts John Spencer into Lord de la Legh.

Amongst the minor characters, that of Maskelyne is one of the best. He is a *dilettante* who flutters about a great many subjects of study, who sketches and writes verses, and hunts butterflies, and who thought "everything gained a new claim to admiration from his praise." "Nature itself," we are told, "was but an unacknowledged rural beauty, until he made her the fashion by his patronage."

Margaret Forrester, who has been one of the victims of the Countess de la Legh, and harbours wild thoughts of revenge, acquires from her eccentric habits the nickname of the Witch of Pendle. A rumour spreads first amongst the Roman Catholic population, which in this district is relatively large,

"that there were *feorin* (fairies) on Pendle. Soon the story ran that a witch lived with some owls, in a cleft in a rock hid by a cascade, in a dark wood on the side of Pendle. Then that the witch had come to 'spite' some folk that had done her wrong. They would know whom she wished to spite, for they would have murrain in their 'shippons,' 'rot' among their sheep. The *tean-la* could not break her spell. She had the evil eye. If any maiden pined, it was the Pendle witch. If any lad lost his way in a snow-storm on Pendle, he had been bewildered by the witch."

The popular feeling is nursed and stimulated by Margaret's enemies, who at length prefer vague charges against her, in which it is embodied. At the examination before the magistrates, one of the witnesses thus expresses the current notions about witchcraft:—

"'Nay, dunnot go may (make) a pretence o' not knowing witches' tricks. They gathern fernseed boi moonleet (moonlight), an' they know weel t' rings weer (where) t' feorin (fairies) deaunce, and tey (they) pull'n up gress (gather the grass) at eaut side o' t' ring, an tey seyn feau words (they say foul, strange words), as bewitchen mon or becast as ates (eats) what teyn (they have) gathered.'"

The pictures of Lancashire character and scenery are, as might be expected from the author, at once graphic and correct. They give vivid glimpses of the social life, customs, dialect, and general character of the hardy race who inhabited East Lancashire sixty years ago. The scene of action is not, however, confined to Lancashire. There are some brilliant pictures of London fashionable life, in which the sparkling Lady Treherne, with her chronicle of scandal and suggestions of social flaws, is admirably contrasted with Lady Arden, who seeks consolation for a mind diseased in aiding the political labours of her father. The poison which Lady Treherne is instilling into the mind of Alice Hindle is rendered nugatory by the truer views of Lady Arden, who strives to reassure her shrinking timidity in words which point the moral of the book:—

"Will you prefer obscurity, or will you not learn that duty and service may be done in any sphere?"

There are also some scenes laid in Australia, including an account of a clever capture of an escaped convict.

There is, it will be seen, a kaleidoscopic interest about the book. Now we see a beautiful Lancashire clough, now an Italian lake, now an Australian shepherd's hut, now again a brilliant London *salon*. But the interest of the book centres in Ribblesdale. The author has a keen appreciation of character, and we are always glad to see his sketches of the people and places of his native county.

WILLIAM E. A. AXON.

MINOR LITERATURE.

New Routes for Commerce.—The Mishmee Hills. By T. T. Cooper, F.R.G.S. (Henry S. King & Co.) There are always two sides to every question, and from the Chinese point of view we cannot help thinking that "New Routes for Smuggling" would be a more appropriate title for this attractively got up little volume. It appears from Mr. Cooper's introductory chapter, that the Chinese Government, indifferent to the eternal truths of free trade, and preferring indirect to direct taxation, chooses to supply its Thibetan subjects with brick tea from its own distant provinces, instead of allowing them to buy that delicacy, to them a necessary of life, from their neighbours, the Assam tea-planters, thus depriving the latter of their most accessible market. A previous attempt of Mr. Cooper to remedy this absurd misdirection of power, and to open a trade route from the Chinese side, met with a singular want of appreciation from the authorities, who stopped the traveller and kept him in durance vile till liberated by a friendly tribe. Without any wish to question the right of the producer to find a market how and where he can, we cannot help reflecting that efforts of this nature are not always met even by the most enlightened governments in the spirit they may perhaps deserve. For instance, should an enterprising Chinaman attempt to lay the foundation of free trade in salt with the population of rural Bengal, or to supply our French neighbours with decent tobacco, instead of the home-grown abomination they are compelled to consume, we fear that his

reception by the officials would be somewhat like that of Mr. Cooper in Thibet, except that the neighbouring tribes, though they would doubtless be most friendly, would lack the power to effect his release.

Foiled in his first attempt to evade the vigilance, or, as he terms it, the "espionage" of the Chinese mandarins, Mr. Cooper made a second attempt from the Assam side, the chronicle of which lies before us. Whatever opinion we may have of the object of his journey, the heroic courage with which he made his way against moral and physical difficulties commands our sincere admiration. Enfeebled by repeated attacks of fever, and lamed by an abscess in the foot, he struggled on, in a deadly climate, with insufficient food, among hostile natives, through tangled forests and over precipitous mountains, till almost within sight of Roemah, where he hoped to establish friendly relations with the Thibetans. Alas! the espionage of the Chinamen had been too much for him, and he had to retrace his steps on learning that a force had been posted at Roemah to prevent his entry. His only consolation was that of persuading the chiefs of the Meju Mishmis, hitherto at enmity with the English, to make overtures of peace to the authorities at Sudiya. His account of these wild frontier clans and the hardly less barbarous Khamtis, under whose protection he travelled, is not without interest; and the numerous episodes of sport and adventure scattered through the book make it one of the most amusing books of travel we have lately read.

True Stories of Arctic Adventure and Discovery: a Book for the Young. By Mrs. Chisholm. (Cassell, Petter & Galpin.) The only objection we have to this work is that the story is conducted in conversations between Mrs. Chisholm and her children, and the remembrance of the sufferings which we were caused by this inhuman device in the breezy days of boyhood at the hands of Mrs. Markham and other "goody" writers has made us loathe the system ever since. The work, however, contains an excellent, faithful, and really interesting account of all the notable Arctic expeditions from the time of Edward VI. down to the year 1859. There is no species of enterprise that requires such true pluck and self-denial, accompanied by so much self-reliance, as Arctic exploration. It is the school in which our best naval officers have been trained, and in which we hope they may long learn the highest capabilities of their profession.

Ena, or the Ancient Maori. By George H. Wilson. (Smith, Elder & Co.) The Britain of the South receives from the Englishmen who have taken possession of it very different treatment from that which was accorded to our own island by its Roman, or even its so-called Anglo-Saxon colonists; and perhaps it is a necessary outcome of modern ideas that even so superior a race of barbarians as the Maories must be gradually civilised out of existence. But before they disappear altogether it is very desirable that their institutions should be fairly described and their traditions put on record, albeit with as much heaping up of fable and meretricious adornment as occurs in our Arthurian legends. A praiseworthy effort in that direction was made two years ago by Mr. Alfred Domett in his *Ranolf and Amohia*, and a much less notable, yet useful, effort of the same sort appears in Mr. Wilson's *Ena*. This is not an epic poem, but a prose fiction, in which the fiction is very thin and the prose is rather heavy. As a work of art it cannot be commended. As an honest attempt to portray the manners and opinions of the native New Zealanders, however, it deserves kindly mention. Many persons, nowadays, are willing to take in a great deal of instruction, bad or good, through the medium of a tale, while they would strongly object to receive it in more matter-of-fact form. For such persons Mr. Wilson's book seems to have been written, and to them it ought to be acceptable.

Mr. Wilson says that it is a "not altogether

fictitious story," but if there is much basis of fact in his plot, it is probably only such fact as might be common to the history of half a hundred Maori heroes and heroines. Ena is the brave and beautiful daughter of a chieftain, described as reigning in the Paramatta district, some sixty years ago. Her tribe being attacked by powerful enemies, she is stolen by them and taken far inland, while the tribe is all but exterminated. At length, being rescued, after many hardships, by her brother and her lover, she is brought home to kill herself after witnessing the death of both brother and lover, as well as of the residue of her kindred and clan. The brother is supplied with an object of worship in an American maiden who has been washed ashore from a ship wrecked off the coast, and who, until she dies of consumption, is half worshipped, on account of her own virtues and the novelty and mystery of her appearance, by all the other Maories with whom she comes in contact. But in the threads of love stories running through the book there is little to unravel and nothing worth unravelling. Its sole value is in its sketches of New Zealand scenery, which are often very graphic, though sometimes overwrought, and, yet more, in its illustrations of New Zealand customs, and of what appear to have been the main characteristics of Maori life and temperament before the era of English colonisation. We are shown how "beneath the rough exterior and unsophisticated manners of the natives there lay the germs of true nobility, gentleness, honour, and fidelity, united with and inseparable from fierce passions hammered into steed impulses that became brighter, harder and colder as misfortune drove them through the bloody furnace of adversity." Their feasts and funerals, their huts and houses, their war-councils and their fighting ways, especially the latter, are described carefully and often vividly, and we are helped to appreciate the fine qualities that were in them, notwithstanding their luckless tendency to destroy one another before English colonists undertook to hasten on the work of destruction by help of rum and gunpowder. Whether this painful result of English colonisation was necessary, whether different treatment might not have produced very different and much happier effects, Mr. Wilson does not set himself to say.

Maoria: a Sketch of the Manners and Customs of the Aboriginal Inhabitants of New Zealand. By Captain J. C. Johnstone, Bengal Army. (London: Chapman & Hall, 1874.) During the last five and twenty years a notable change has taken place in the interest with which the reading public regards the sayings and doings of the noble savage. In the days of our youth, not only Fenimore Cooper, but a host of imitators, were able to awake feelings of sincere sympathy for the helpless red man and his rapid improvement off the face of the boundless prairie. Perhaps we have found out that the Last of the Mohicans and his like are nothing more than the ordinary heroes of romance, clad in paint and feathers instead of doublet and hose; perhaps we are too depraved to care to read of simple virtues and unsophisticated crimes, or of anything but breaches of the ten commandments by sinners in good society. Anyhow, we fear that Captain Johnstone's book will hardly meet with the success it deserves as the picture of the life of a race which, a few generations hence, will have left not many more traces than its own "Moa." The author has evidently made a careful study of the remarkable people who are called by us New Zealanders, and by themselves "Maori," and has issued the fruit of his labours in the form of a romance, chronicling the rise of a feud between two powerful tribes a couple of hundred years ago, the effects of which have lasted till our own day. He has succeeded in giving graphically-written descriptions of their mode of fighting and fishing, love-making and house-building, the superstitious rites they practised, and the scenery in which they lived; but the thread of plot on which he has strung these scattered pearls together is of the slenderest, and the unmerciful use of native words, enforcing con-

stant reference to the page where the mysterious term first occurs, is a grievous obstacle to fluent perusal of the story. We hope that Captain Johnstone will use his undoubted powers of description and careful study of Maori character to give us the record of his experiences as he obtained them. For such a book we venture to predict a more favourable reception than is likely to be accorded to the present attempt to weave them into a romance.

A Key to the Queen's Regulations as Revised in 1873, has been published contemporaneously with the appearance of the volume itself, by Captain Malton, already known as the epitomiser of several of the drill evolutions. The Regulations have been materially recast in form and arrangement; the recent extensive alterations in military organisation and departmental nomenclature have necessitated the introduction of much new and important matter: so considerable, indeed, are the changes, that a search in the revised edition for paragraphs analogous to those of the old offers in many cases the traditional difficulty of discovering a needle in a bundle of hay. Captain Malton's *Key* gives a comparative table of the obsolete and revised editions, and notices in detail all material additions and alterations. It will, therefore, supply a most valuable aid in the study of a book with which every officer is required to be thoroughly acquainted.

At School with an Old Dragoon. By Stephen J. Mackenna. (H. S. King & Co.) A collection of military tales of the last forty years, intended no doubt for schoolboys at home for the Christmas holidays. The stories are graphically written, and the historical and technical details more accurate than usual in such works.

The African Cruiser: a Midshipman's Adventures on the West Coast. By S. Whitechurch Sadler, R.N. (H. S. King & Co.) Like the last, a boy's book,—this time of naval prowess in the suppression of the Slave-trade; pleasantly told, apparently from personal experience.

Notable Shipwrecks; being Tales of Disaster and Heroism at Sea. Re-told by Uncle Hardy. (London and New York: Cassell, Petter & Galpin.) We have read this book with a great deal of pleasure, for there is something irresistibly, though sadly, attractive in the tales of shipwreck and disaster at sea. Uncle Hardy has done his work well; he has rightly judged that the materials with which he has to deal are of sufficiently absorbing interest in themselves to require no embellishment from his pen; and the narratives of disasters and human suffering are consequently told in a simple, straightforward, graphic, and, we believe, singularly truthful manner. It is a book that will do all young people good. Few boys can read unmoved of the scene of matchless heroism that accompanied the wreck of the *Birkenhead* or the sinking of the *Northfleet*. The sad history of shipwreck is brought down to the latest date practicable, that of the *Atlantic* being the last.

Philip's Handy General Atlas of the World, by John Bartholomew, F.R.G.S. (Philip and Son), is a highly-creditable representative of its class. The maps of which it consists have evidently been compiled with care. They are well engraved and well printed. The paper and binding are good, and the colouring is effective—what is more to the purpose, it is technically accurate. There is, in addition, a copious and judiciously-prepared index of reference. It is among its good features, that a more than ordinary share of attention is bestowed upon the various portions of the British dominions throughout the world. Upon the whole, the *Handy General Atlas* will maintain the credit which Mr. Bartholomew has already acquired in connexion with works of such a class. It is just to add that one or two of the prefixed physical maps, as well as one illustrative of the natural productions of different lands, are, unless we greatly err, but slightly altered from sheets

that have already done duty in other works issued by the same publishers. They will perhaps be none the less welcome on that account to the purchasers of the present volume. But it would have been more ingenious to have treated this as an admitted fact. The substitutions of new titles and borders, with erasure of prior names, are, however, we suppose, among the "fantastic tricks" played by the art of the lithographic printer in such matters.

EDITOR.

NOTES AND NEWS.

MADAME GERVINUS, the widow of the great German commentator on Shakspeare, has consented to become one of the Vice-Presidents of the New Shakspeare Society.

THE late Mr. Sumner has bequeathed all his papers and MSS. to his old and distinguished friend, the poet Henry Longfellow, together with the half of his collections of coins and bronzes, the remainder of which has been left by him to Dr. Samuel Howe, of Boston. After making various dispositions of his property in favour of relatives and friends, Mr. Sumner leaves 50,000 dollars to the library of Harvard College, the interest of which is to be annually spent in the purchase of books; this legacy being, as he says, a tribute of gratitude for the benefit which he himself has derived from libraries, both private and public, and so far merely a just repayment of that which he had himself received in such rich abundance.

GEORGE ELIOT's new volume of poetry, which Messrs. Blackwood will publish about the end of the month, will include the poems contributed to English magazines, and a poem contributed only to an American serial, together, we believe, with more recent poetical work, which will now for the first time see the light.

MR. MUTU COOMARA SWAMY, the Hindu Member of the Legislative Council of Ceylon, and the translator of *Arichandra, or the Martyr of Truth*, has in the press translations of three most important Oriental works. The first is the *Dāhānāse*, the History of the Tooth-relic of Buddha, a poetical work in Pali, of which the text will be published together with the translation. The second is the *Suttanipāṭa*, the Discourses and Sermons of Buddha, a work of great antiquity, of which the translation alone will appear at present, the publication of the text being reserved for a later period. This work is held in very high estimation by the Buddhists, who rank it as high as, if not higher than, the *Dhammapada*, of which a translation was published some years ago. The third work which Mr. Mutu Coomara Swamy has in hand is a translation of the Tamil poems of Tāyumanavar, a philosopher of Southern India. It treats of the two Indian schools of Vedantism and Siddhantism, the latter of which is but little known to Europeans. It is said that some of the later thoughts of European metaphysicians have in it been anticipated.

BARON FRANZ WILHELM VON DILFURTH has just completed an interesting collection of hitherto unprinted German ballads, belonging to the sixteenth, seventeenth, and eighteenth centuries. This collection, which numbers fifty-two songs, chiefly obtained in Franconia, either in a manuscript form or taken down from the lips of Franconian peasants and others, is published at Stuttgart by Messrs. G. and J. Göschen. The greater number possess the undoubted character of national popular songs, but some exhibit a more artificial construction, and are probably the production of students, or itinerant teachers.

MESSRS. PATERSON, of Edinburgh, will publish during the present year, in their series of *Dramatists of the Restoration*, the Works of Sir Asten Cokain, one volume; the Fifth and Last volume of Sir William Davenant; the Works of John Lacy in one volume; the Third and Fourth volumes of Crowne; the Works of John Tatham, in one volume; and the First Volume of Thomas

Killigrew, author of *The Parson's Wedding*. Messrs. James Maidment and W. H. Logan are the editors.

THE Rev. J. M. Hudson, of Boston, United States, has been for some time engaged on a new edition of Shakspeare, and hopes to complete it next year.

MESSRS. BICKERS & SON have in the press new editions of Pepys's and Evelyn's Diaries, and of Ben Jonson's works, the last to be in nine volumes.

THE first part of the *Transactions of the New Shakspeare Society* is nearly all in type, and will be issued in a fortnight or three weeks. Besides the papers read before the Society, and reports of the discussions on them, the part will contain a letter from Mr. James Spedding on the pause-test as applicable to Shakspeare's plays, and reprints of (1) Mr. Spedding's article on *Henry VIII.*, in which, so long ago as 1850, he pointed out the respective shares of Shakspeare and Fletcher in that play; (2) the late Mr. J. Hickson's article of 1848 on *The Two Noble Kinsmen*, in which he showed that Shakspeare wrote nearly half that play, introduced every character in it, and distinguished Shakspeare's part from Fletcher's. Confirmatives of the results of Mr. Spedding and Mr. Hickson, by means of metrical tests, will also be given by Mr. Fleay and Mr. Furnivall.

MR. FLEAY has now arranged with Mr. Daniel, that his revised edition of the first quarto of *Romeo and Juliet*, for the new Shakspeare Society, shall be printed in parallel pages with Mr. Daniel's revised edition of the second quarto, and thus the two revised texts be kept opposite to one another, as the two reprints of these quartos are.

MR. TOM TAYLOR will take the chair at the next meeting of the New Shakspeare Society, when Mr. Fleay's paper on the authorship of the *Taming of the Shrew* will be read, contending that only the scenes in which Katharine and Petruchio appear were written by Shakspeare, the other scenes being due to the recaster of the old *Taming of a Shrew*.

THE following extract from a diary kept at York early in the present century, and purchased by the Trustees of the British Museum on the death of the writer about ten years ago, will have great interest for the admirers of *Tristram Shandy* :—

"April 12th, 1808. I had last night the pleasure of giving a sixpence to an old servant of Laurence Sterne, Richard Greenwood, aged 79, who now lives at Sutton on the Forest—lived three years as servant resident in the house when Sterne lived at the rectorial mansion, since rebuilt. He left his service at Martin—or Michaelmas—1745, having had a few words with his master a short time before in consequence of his refusing to engage as drummer to Kingston's Light Horse, a regiment of cavalry raised in Yorkshire during the rebellion. He used to accompany his master whenever Sterne came to York, and when there he rarely spent a night without a girl or two which Richard used to procure for him. He promised Richard to reward him for keeping these private amours of his secret, particularly from Mrs. Sterne. Richard says he was as good as his promise, and that for his part he never mentioned these things concerning his master. Sterne too was continually after his female servants, and these things, and sometimes his affairs at York, would come to the ears of Mrs. Sterne, and, as might be expected, great quarrels ensued. During all the time he lived with them they were upon very ill terms. She brought him several children; only one grew up, a very fine girl called Lydia. Richard has heard that she married in France. Most of the rest died in very early infancy—one boy lived three weeks. Sterne was inconsolable after his death, took to his chamber, and would not leave it of (*sic*) a week. Richard remembers a sister of Sterne's visiting them, one of the finest women ever seen, and thinks he has heard that his mother was in great distress at York, and that his master would have relieved her, but was prevented by his wife.

"When anything produced a difference between him and his wife, he would order Richard to bring out his

horse, and they would go together to York, where he soon lost all his cares in the arms of some more blooming beauty. He would frequently be absent many days together on these occasions, and should Sunday intervene, did not return to perform the duties of the day. He did not attend well to the duties of his situation, but when he preached, the audience were quite delighted with him, and he never preached at Sutton but half the congregation were in tears. The Minister was crowded whenever it was known that he was to preach; he used often to preach nearly extempore. He had engaged to preach at Farlington, a few miles from Sutton, and when there, found he had forgot his sermon. He only asked for a Bible, and composed a most excellent sermon, which he delivered from a scrap of paper no bigger than his hand.

"He was for many years at variance with the Harlands, the squires of his parish. It originated in his determination to give a settlement to a man who, exercising a trade which required apprentices, Mr. Harland thought that thereby an expense might be brought on the parish. Sterne was determined to carry the point, and let the man a farm of 10*l.* a year, which gave him a settlement, and he never spoke to the Harlands after. Sterne was a justice of the peace, and would often espouse a cause which he was sure of bringing through at the Quarter Sessions; he could talk down the lawyers so; this he delighted in. He was a man of prodigious wit, and the entertainment of every company; he never drank to excess; he usually after dinner took one glass of wine, of which he drank half and filled his glass with water for the rest. In person tall and thin; when composing would often pull down his wig over one eye, and remove it from side to side.

"He died and was buried in London. Richard has heard, and it was generally believed in the village, that his corpse became a subject for the surgeon's knife—a gentleman viewing the skeletons or subjects in some of the London Hospitals challenged one for Sterne by the number of teeth in each jaw. Alas, poor Yorick!"

MESSRS. HENRY HOLT & Co., of New York, announce a *History of American Currency*, which will contain a good deal of valuable collateral matter, by Professor W. G. Sumner, Professor of Political and Social Science in Yale College.

WE can only refer our readers to the *Nation* of March 26 for an article entitled, "One of the American Pet Marjories." A volume of poems, written in 1871, by a young maiden of from nine to ten years of age, has just been privately printed by the authoress's indulgent parents. It contains above sixty short pieces, beside three dramatic performances: *A Rolling Stone Gathers no Moss*, a tragedy; *No Use Crying for Spilled Milk*, a tragedy; and *Victor, the King of Fairyland*. This outdoes Chatterton and Pope, and we shall look for an epic from the poetess before she attains her fifteenth birthday.

THE *Nation*, after stating that Mr. Launt Thompson's interesting ideal statue of the Rev. Abraham Pierson, first President of Yale, is to be unveiled at the College on Commencement Day, remarks that a Catechism composed by the President's father, the Rev. Abraham Pierson, pastor of the church at Branford, Conn., in the language of the Quiripi Indians, and published at Cambridge, Mass., in 1658, has recently been in a sense rediscovered. It bears the title, *Some Helps for the Indians, showing them how to Improve their Natural Reason, to Know the True God and the Christian Religion*.

"Of this tract but two copies are known to be in existence: one in the British Museum, and the other, with a different title-page, in the library of Mr. James Lenox, of New York. A reprint of it, with the competent editing of Mr. J. Hammond Trumbull, has just been published in a limited edition of one hundred copies. Mr. Trumbull says in his Introduction that this Catechism is the only book printed in any Indian dialect of the south-west parts of New England, and is probably the first work of an author belonging either to the Connecticut or New Haven colony which was printed in this country. It supplies linguistic material of some value to philologists; and the interlineation

of the original English with the Quiripi version illustrates a method of religious instruction which many good men of Mr. Pierson's day agreed with Dr. Reynolds in regarding as 'a very proper and necessary course for those to take who would convert and persuade pagans to believe the truth.' Mr. Trumbull indicates a few of the many piquant passages in which this method shines by its absolute want of fitness; as when the question: 'How do you prove that there is but one true God?' is answered thus: 'Because singular things of the same kind when they are multiplied are differenced among themselves by their singular properties; but there cannot be found another God differenced from this, by any such like properties.' The Quiripi Indians, it may be added, lived near Long Island Sound, from Guilford westward, to and beyond the west bounds of Connecticut. Their name signifies *long water*."

As Mr. Fleay was discussing the authorship of the play of *Troilus and Cressida* in a recent number, the following notice of an earlier play on the same subject may be found interesting, although the information it gives is but scanty.

There are preserved in the Public Record Office certain books containing the accounts of Richard Gibson, who was Master of the Revels during several years of the reign of Henry VIII. In his account of the expenses incurred for the celebration of Christmas in 1515, at the Manor of Eltham, he describes a castle of timber which was prepared as the scene of a sham fight, and continues thus:—

"Allso in the sayd tyme of Crystmes for solas by Master Kornych and other, and by the chylldryn of the chappell was playd the Story of Troylous and Pandor, rychely inparelled, all so Kallkas and Kryssyd inparylled lyke a wedow of onour in blake sarsenet and other abelements for seeche mater; Dyomed and the Grekes inparylled lyke men of ware akordyng to the intent or porpoos."

This "komedy" was followed by a tournament, after which the queen and ladies of the castle recited speeches composed by Mr. Cornish, who was master of the boys in the Chapel Royal, and the minstrels on the walls and towers played a melodious song. Nothing is said by Gibson of the performance of the comedy, but the following particulars as to the costumes occur in the account. "Eulyxes" was played by one of the chapel children in a doublet of white and green satin of Bruges. Troilus wore a double cloak of red and yellow sarsenet, a satin doublet, velvet shoes, and a feather. Calchas was played by Cornish, in a mantle and bishop's surcoat of yellow sarsenet, a black sarsenet gown and bonnet, a coped cape stiffened with pasteboard, and a yellow satin girdle. Cressida wore a surcoat and mantle of black sarsenet, and a widow's hood and wimple of Florence cotton.

Diomed and his fellows wore Greek robes and girdles of red and yellow sarsenet, with Holland shirts the sleeves of which were very wide, hanging out at the hand and other places. Of Pandarus, it is only stated that he had a red and yellow satin doublet, with points of copper gold ribbon and silk ribbon. Spanish girdles and points were supplied to all the actors, and a barber was paid 4*d.* for trimming their hair and washing all their heads. How far this show deserved to be called a "komedy" it is impossible to say. Hall does not mention it in his *Chronicles*, and we are not aware that any other writer speaks of it. It may have been only a sort of pageant, or *tableau vivant* founded on Chaucer's poem, but the probability is that there was some dialogue. Perhaps some of our readers who are well acquainted with the early history of the stage may be able to give more information on the subject.

MR. JUSTIN WINBOR, superintendent of the Boston Public Library, writes to the *Boston Daily Advertiser* on a question of great literary importance. The account of the Barton collection, printed fifteen years ago, mentions that Sir Walter Scott was at one time engaged on an edition of Shakspeare, and the statement is fully confirmed by the *Life of Archibald Constable*, recently published. Constable first suggested to Scott, in

February 1822, that he should undertake an edition in twelve or fourteen volumes, with notes, &c.; and Scott, though at first reluctant, while admitting the want of a "sensible" Shakespeare, finally became more inclined to it, "with my son Lockhart's assistance for the tag." Scott's labour was to be chiefly confined to the introductory volume. On September 20, 1825, "Shakspeare is getting on;" and the editor of the *Life* adds that "three volumes of the edition were completed before the sad crisis in 1826, but then laid aside; and ultimately, I have been told, *the sheets were sold in London as waste paper*. It is even doubted whether one copy be now in existence."

"These statements," continues Mr. Winsor, "give a peculiar interest to the volumes which are now in this library, and which are perhaps the only ones of the edition now in existence. They were printed in Edinburgh by James Ballantyne & Co., and constitute volumes second, third, and fourth of an octavo edition. They have no title-pages, no general introduction, and but brief ones of a page or two to each play—the second containing *Two Gentlemen of Verona*, *Comedy of Errors*, *Love's Labour Lost*, and *Merchant of Venice*; the third, *Midsummer Night's Dream*, *Taming of the Shrew*, *As You Like It*, and *Much Ado About Nothing*; the fourth, *Merry Wives of Windsor*, *Measure for Measure*, *All's Well that Ends Well*, and *Twelfth Night*. The notes at the foot of the page seem to be derived from the ordinary sources. *Love's Labour Lost* has at the end 'Notes concerning the character of Holofernes.'

"On a fly-leaf of volume two is a memorandum signed by T. Rodd, the well-known London bookseller, with whom Mr. Barton had constant dealings, in which it is stated that he (Rodd) bought the volumes at a sale in Edinburgh, in the catalogue of which they were entered as Shakespeare's works, edited by Sir Walter Scott and Lockhart, volumes two, three, and four, all printed *unique*. The memorandum continues: 'That Scott entertained the design of editing Shakespeare, I know from A. Constable, who mentioned it to me more than once; and I sent him a little book of memoranda for Scott's use; but, as he, Constable, informed me, it never reached him. The bankruptcies of Scott and Constable prevented the completion of the work. The book has marks of Scott's usual inaccuracies, as I find on casually opening these volumes. . . . Scott is perhaps the most faulty and careless of writers, unless it be T. F. Dibdin. It is hardly saying too much of either of them to assert that a gross mistake might be found in every page issued by either of them.'

"There is also contained in the volumes a memorandum by a friend of Mr. Barton's, showing that at the time it is supposed Scott was engaged upon this editing work, he was also giving other indications of his interest in Shakespeare, in writing in his *History of Scotland* a detailed historical account of Macbeth's story, with a reference to the incorrect tale of the dramatist; and in his *Saint Ronan's Well*, a full sketch of an amateur representation of *Midsummer Night's Dream*."

Mr. Winsor will be glad to learn whether any other copy of this edition—which is not mentioned in Bohn, Allibone, or Thimm, or in the catalogue of the Shakspeare Memorial Library at Birmingham—has escaped destruction; and, if so, whether it corresponds in all particulars with that in the Boston Library.

In the present number of the *Fortnightly Review* the editor commences what promises to be a very suggestive, stimulating, and incredible treatise on the subject of "Compromise." The introductory chapter is taken up with an ingenious lamentation on the decline of moral earnestness, which has been repeatedly predicted as the inevitable consequence of the spread of "positive" ways of thinking beyond the narrow limits of that section of the speculative class who embrace "extreme" opinions while they are unpopular. What hinders Mr. Morley from recognising an obvious connection which disinterested thinkers like De Tocqueville saw forty years ago, is that he proceeds on the baseless assumption that moral principles are generalisations from experience instead of the translation in the empirical sphere of

those wishes which in the metempirical sphere are translated into mythologies and theologies, and in both are more or less than rational. No doubt practical principles of this kind are capable of being modified by experience, and are being increasingly modified now. English politics in particular have pretty nearly passed into the "positive" stage, while French and, still more, German politics continue to be "metaphysical." And it is precisely of the increasing control of experience which Mr. Morley really complains. The second chapter, "Of the possible Utility of Error," is chiefly important as a reply to M. Renan's audacious proposal that the few and the many should permanently agree to differ in belief. No doubt, as Mr. Morley shows, such a "compromise" would team with paradoxes (greater than the old one that the wise in this matter should learn of the unwise), and would prove more costly in practice than M. Renan anticipates; but it has the advantage of leaving room for broad facts, which Mr. Morley ignores. The great majority of mankind have always been lazy, stupid, selfish, sensual; and history, which Mr. Morley rightly calls "a huge *pis-aller*," is a record of the ways in which they have been *exploit*ed by the minority who have been less so, in order to make them fit instruments of a civilisation by which they have profited little. If we interpret individual interest either by the case of unmolested habit, or by the proportion of satisfaction to desire, or by the perfect play of natural faculty, it has never coincided on a large scale, and is not likely to coincide for generations, with the interests of "humanity," except among moderately egoistic members of the progressive sections of the directing classes. That the mass of mankind should come to know what is their interest for this life, and act upon the knowledge, as they are beginning to do in Scandinavia, would be such a shock to civilisation that most intelligent people, except Mr. Morley and Mr. Fitzjames Stephen, shrink increasingly from the risk of shaking the "superstitions," which at any rate keep most men quiet, to be *exploit*ed—for or against "humanity." To imagine that, when the "superstitions" have disappeared, the "religious sentiment" will remain, is contrary to experience, which shows that in most men the religious sentiment has always been artificially maintained by the inculcation of opinions incapable of being "verified" in this life. A man may suit his wishes to his knowledge and the knowledge of his betters; then he will economise his force. He may suit his belief to his wishes and the wishes of his betters; then he may augment his force. Mr. Morley wishes us to have it both ways, and thinks he "does well to be angry" because we see that we can't.

THE essay on "Wordsworth," which Mr. Walter H. Pater contributes to the just issued number of the *Fortnightly Review*, would require perhaps to be retouched ere it could take its place quite worthily, as a work of literary art, beside his other essays. That does not prevent its being, as it now stands, better as literary art than almost any known dissertation on the poet. Its finish of detail gives it a place which neither the graceful contribution of Lord Coleridge nor the weighty contribution of Mr. Hutton aspires to fill. The substance of the criticism is a different question; for our part, we think the criticism itself as penetrating as any already published upon the same theme. Within its own limited range it is surely as sound. And if in finish of handiwork it is scarcely yet the equal of the *Studies in the Renaissance*, it is actually equal to these in finish of thought. The essay has the unbroken, the flowing character of a single movement of a sonata, while, in fact, it includes the full variety of many movements. The reader will not expect to find Mr. Pater departing from the principle of criticism adopted in his book, and laid down, if we remember rightly, as one of two possible ones, by Mr. Symonds in his review of

the book in these columns. What, Mr. Pater asks, is the particular savour of Wordsworth's poetry?—what is the peculiar impression which the poetry of Wordsworth produces upon me? No doubt he will be told, as he was told, with more of truth, of his study of Botticelli, that in his essay at an answer he has succeeded less in showing what Wordsworth really is, than in showing what he believes Wordsworth to be. The writings of Wordsworth, says Mr. Pater—and here nobody will disagree with him—are the central and elementary expression of that keener sense of natural things, that "consciousness which weighs, listens, penetrates, where the earlier mind passed roughly by." Again, "there was in his own character a certain contentment, a sort of religious placidity, seldom found united with a sensibility like his, which was favourable to the quiet, habitual observation of inanimate or imperfectly animate existence." Furthermore, he approached human life through nature, which was alive to him. His religious sentiment, consisting much in the recognition of local sanctities, was in truth natural religion; and his appreciation of passion in the lowly was due in part to his sense that humble life was nearer to Nature than other life, and that there, where he saw it, it was in some way elevated and solemnised. Having thus much to say for those who value the concentrated expression of human passion—found by him, Mr. Pater would remark, in the elementary exhibition of elementary feelings, by the poor—Wordsworth, with his much pondering, with the strange reminiscences and forebodings of his poetry, which carry us behind and before, has also something "for those who feel the fascination of bold speculative ideas." And though the office of poet is not that of moralist, and the first aim of Wordsworth's verse is to give the reader its own peculiar pleasure, one chief lesson he conveys: "the supreme importance of contemplation in the conduct of life." Impassioned contemplation is with him "the perfect end"—his work is to withdraw the thoughts for a space from the mere machinery of life, so that one may witness with "appropriate emotions" the spectacle of the great facts of man's existence.

DR. MAUDSLEY's article on "Sex and Mind in Education," in the same Review, will disappoint the expectations raised by his name. His extensive pathological experience appears to have thrown no light upon the interesting question whether the effects of sex are to be traced in mental processes properly so called; at least, instead of himself speaking with authority on this subject, he relies mainly on the doubtful authority of some American writers to prove that the physical constitution of young girls is unequal to the strain of an ordinary school education, and that therefore, in the interests of the race, their instruction should be carried on with special reference to their presumed destiny as wives and mothers. Of course the advocates of the "co-education" of the sexes, or its equivalent, hold that any stimulation of the mental faculties is excessive which disturbs the balance of the general health. The practical question for doctors and fathers to determine is the quantity of purely mental exercise necessary to *preserve* the balance by a full parallel development of all the organic powers. Whether such mental exercise ought to be, or can be, different in kind according to the sex of the pupil will depend upon the extent to which the structure of the brain is found to be affected by the broader differences of organisation to which Dr. Maudsley refers.

THE contents of the *Contemporary* are more miscellaneous than usual. Mr. Ralston gives some translations of Russian idylls, by Koltoof and Nikitin; one by the former, "The Mower," even in a prose version, has a strangely vivid power of sentimentalising the hero's employment. Mr. Bagehot restates, with an apology for slaying the slain, the metaphysical basis of toleration; but when the ghosts of dead errors walk, they are generally

impervious to argument, and have to be laid by more sentimental agencies. Mr. Haweis' "Memorial of Emanuel Deutsch" will be read with the more interest on account of what we cannot but think its indiscreetly confidential nature.

THE interest and importance of the field of research opened in Mr. Tylor's paper on "The Philology of Slang" (*Macmillan's Magazine*) will surprise most readers, as much as it has done the author, for philologists in general seldom notice more than a few slang words in more or less reputable use in their own day, neglecting the living language of the streets, with its constantly new formations and its perplexing survivals, pointing to forgotten historical intercourse with sections of other nations. Sometimes the same metaphor exists independently in the slang of two countries, as the German *loffen*, to make love, or *spoon*; sometimes a descriptive word continues to be slang in one language (French and Italian *tirants*, *tirantes*), when its equivalent (English *drawers*) has become prosaically respectable; or, again, English *to-do*, French *affaire*. A common source of slang is of course the corruption of foreign words, but few remember that the rage for Italian fashion in the sixteenth century bequeathed *commission* (*camicia*) as a cant name for shirt; and still fewer would guess that the Italian organ-boys have enriched London streets with a new set of numerals, *oney*, *doee*, *tray*, *quarterer*, *chinker*, *say*; then, "having reached the limits of the silver sixpence, they begin afresh; so that, for instance, *say doee saltee* is eightpence." An older bit of derivation is that of *vamp*, from Palsgrave, "*vampey* of a hose, *avant pied*," *vamp* being originally a proper cobbler's term for putting new "uppers" to an old boot. Mr. Tylor notices the vitality of some expressions; "shoplifting," for instance, coming in when "cattle-lifting" was in the way to be forgotten. Amongst slang abridgments (like *rad* and *rit*, for radical and ritualist), he mentions *cure* for curiosity, which we believe was introduced rather by a foolish music-hall song.

In the *Cornhill* Miss Thackeray introduces us to *White Cotton Nightcap Country*; but the legend of *The White Cat*, a pretty little Blanche, whom the Curé of St. Rambert wants to take the veil, is a little less consistently worked out than usual. The local scenery is admirable, and there is naturally a tribute to the poet of "sea-coast nook-full Normandy."

"A SPRING Thought" in *Good Words*, by the author of *Mrs. Jerningham's Journal*, is really pretty.

THE following account, not hitherto published, we believe, of the collection and preservation of the unique series of newspapers and fugitive literature of the Civil War period, now known as the King's Pamphlets, in the British Museum ("huge piles of mouldering wreck, wherein, at the rate of perhaps one pennyweight per ton, lie things memorable," according to Mr. Carlyle) is to be found amongst the state papers of the Restoration period.

"There have been great charges disbursed and pains taken in an exact Collection of Pamphlets that have been published from the beginning of that long and unhappy Parliament which began November 1640 and continued to his Majesty's happy Restoration, consisting of about Thirty thousand several Tracts of all sorts and on all sides. . . . The Collection was so privately carried on that it was not known there was such a design in hand, the Collector intending them only for his Majesty's use that then was. His Majesty having once occasion for one Pamphlet could no where obtain it but from the Collector of these, and having seen it and perused it was so well satisfied therewith, that he commanded a Person of Honour with his own hands to restore it to the owner, and likewise His Majesty's great desire to have it continued, and express a good liking to the undertaking; this was the greatest encouragement the Collector had, otherwise it is probable it had not been prosecuted, the work proving so extraordinary difficult and hazardous, and the

Charges heavy and Burthensome both to himselfe and servants, it continuing for near Twenty years.

"And that the discovery of them might be prevented when the Army was Northward they were packt up in trunks and by one or two in a weeke sent to a trusty friend in Surrey who safely preserved them. When the Army was Westward and fearing their return that way, they were sent back to London, but not to be trusted there were sent into Essex, and when the Army ranged that way, to Triplo heath. They were brought back from thence, and then there was an intention of sending them for Holland for their preservation, no place being safe in England. But this way would not be ventured, and another course was followed, they were placed in a Warehouse in form of Tables round the rooms covered over with Canvas. Continuing still the Collecting, any even when the Usurper had taken him out of his bed and kept him close prisoner at Whitehall for seven weeks, still hoping for that time which Thanks be to God is come to give him reprieve from so unparalleled Labour.

"If the Usurper had found them by any Information, the Collector to secure them had made a formall Contract with the University, and had signed an Acquittance to them for one Thousand pounds acknowledged to be received in part for them that they might claim them who had in all probability a greater power to struggle with him and preserve them, than he could have.

"All these hard shifts and exigents hath he been put into to preserve them for the use of succeeding ages, which will scarce have faith to beleve that such horrid and detestable Villanies were ever committed in any Christian Commonwealth since Christianity had a name."

The collector of these pamphlets is said to have been one George Thomason, of whom the following notice appears in *The Obituary of Richard Smyth*, published by the Camden Society: "April 10, 1660, Geo. Thomason, bookseller, buried out of Station" Hall (a poore man)."

WE are indebted to the courtesy of Mr. Thoms for the following remarks on the case of Lady Mary Digby, mentioned in our last:—"There can be no doubt that the statement in Nichols's *Leicestershire*, vol. iii. p. 473, that Mary, daughter of Francis Nele, and the mother of Sir Everard Digby, of Gunpowder Plot celebrity, was born in 1513, is incorrect; whether it originates in a misprint or in imperfect information. She is stated in Collins's *Peerage* (ed. Brydges, v. 353) to have been born in 1559; and as she gave birth to Sir Everard in 1581, and subsequently to four other children, this is probably the correct date, as it makes her a mother at twenty-two and not at sixty-eight, as she would have been if born in 1513."

M. LE VICE-AMIRAL JURIE DE LA GRAVIERE has an article in the *Revue des Deux Mondes* for April 1, on "Les Origines de la Marine Moderne." The discovery of the New World and the progress of artillery substituted sailing-vessels for galleys propelled by oars, although in France the royal corps of galleys preserved its organisation, funds, and military and finance officers till 1749. The modern navy is scarcely more than two centuries old. Up to the beginning of the seventeenth century, great armaments were occasionally fitted out for the transport of troops, such as those of William the Conqueror and Edward III., and the Spanish Armada; but these were disbanded as soon as they had answered their immediate purpose, and war by sea was carried on by privateers, licensed by the various States which required their services. Sweden and Denmark were the first Powers to form anything like a regular navy, and the Baltic shared for some time with the Mediterranean the honour of being the naval cockpit of Europe; but the supremacy soon passed to the Dutch, and it is to the rivalry between the Dutch and the English, and their many struggles in the Channel, that we must trace the origin of our modern marine. The Dutch established an elaborate organisation, the whole country being divided between five elective councils, each composed of seven deputies nominated for three years, contri-

buted a fixed quota to the maintenance of the fleet, and having its distinct corps of officers, who had earned their commissions by merit, and who were required to raise and support their own crews. The admiral of Rotterdam was commander-in-chief; if he fell, his place was taken in succession by the admiral of Zealand, Amsterdam, North Holland, and Friesland. Holland was for many years the only naval Power that maintained a permanent staff of captains at the cost of the State in time of peace. Of the English navy at this time *Pepys's Diary* gives a vivid picture. When Richelieu came into power he found that France had no marine. In 1626 there were not twenty French ships to 300 leagues of coast; France had no foreign market open to her manufactures, and had to pay whatever price was asked for colonial produce, sugar being nearly four francs a pound, while coin was being perpetually drained out of the country. Richelieu at once devoted one tenth, and afterwards one fifth of the revenues of the State to the creation of a navy. He established dockyards at Marseilles, Brest, Brouage, Havre, and Calais, and provided that the plan of every ship to be built should be submitted to a council of six or seven captains, and that precautions should be taken for the maintenance and administration of the navy, which are practically identical with those observed at the present day. In fact, naval engineering alone is wanting in the ordinance of 1631. No ship might, under any circumstances, be surrendered under pain of death; the same rule was laid down in the ordinance of 1689, and it was only modified, owing to the progress of artillery, in 1765. Richelieu also kept in regular service a number of captains and lieutenants, who were to serve as a nucleus, and to train up the scions of the French nobility and the *élite* of the nation to officer the king's ships. But the parsimony of Mazarin undid the work of his predecessor, the sum expended on the navy was reduced under his régime from 5,000,000 to 300,000 livres, and Colbert had to begin again at the foundations, building, however, on the lines of Richelieu's great ordinance of 1634. "That ordinance," says M. de la Gravière, "still impresses us by its clearness and precision. Everything essential finds its place therein. Many regulations have been added since; they have been more explicit, have entered into more minute details; they have not given a better settlement to the great questions of principle."

THE article on "Livie et la Fille d'Auguste," by M. Blaze de Bury, in the current number of the same Review is well worth reading for its imaginative truth and fullness, though it adds nothing to knowledge, and exaggerates the activity of Livia for the sake of empty declamation about her "crimes." The author succeeds better with Tiberius, whom he only treats incidentally.

NOTES OF TRAVEL.

MR. ARTHUR LAING, an English merchant at Zanzibar, has arrived in London in charge of the diaries and effects of the late Dr. Livingstone. The body will arrive by the Southampton steamer next week. From statements made by those who accompanied Dr. Livingstone, it appears that on leaving Uvanyembe, in August 1872, the party marched south through the country of Fipa, crossing the Rungwa, a stream said to enter Tanganyika Lake. They passed through the land of Wemba, crossing the Cham-bezi, a river of considerable size visited many years ago by the Portuguese. They were soon compelled to return to its north bank at a place not far from where it enters Lake Beniba; making a considerable *détour* to avoid the marshes and canals near the bank of that lake, they succeeded in getting canoes at a village on the northern shore, in which they reached the island Matipa in the middle of the lake. Hence an almost continuous water horizon presented itself, and great difficulty was found in

getting canoes to convey the large party from the island to the southern shore. These being at last secured, Dr. Livingstone and his followers landed in a valley on the southern shore; but the rains having by this time set in, the country was in many parts inundated, and the march had to be continued for hours through water. Here several of the natives of the party seem to have died, and Dr. Livingstone, who had been weak and ailing during the whole of the journey, would seem to have abandoned the idea of going further west; but taking the route northwards from Urabende, made an attempt to reach the high grounds of Katanga, where he hoped to recruit. This, however, he was not able to accomplish, for before leaving the Bisa country, he had to be carried by his followers for three whole days. On reaching the village of Ketamba, chief of Ulala, the party was refused permission to proceed, and they returned three hours' journey in the direction of Kabende, where a native hut was constructed, under the shelter of which Livingstone lingered for a few days, and died, as far as at present can be ascertained, on the 4th of May last.

Having disembowelled the body, which they filled with salt, and placed it in the sun, his servants returned by the north of Lake Bemba, conveying the remains of their late master to Unyanyembe and Zanzibar. On the whole of this journey a diary was carefully kept by Jacob Wainwright, one of the liberated Africans sent by the Nassick school to assist Dr. Livingstone. On arrival at Zanzibar the body was partially examined, and placed in a zinc coffin, and is now on its way to England in the mail steamer expected to arrive in Southampton on Monday next. We further learn, by letters now received from Zanzibar, that Hartley, the missionary, who, as we stated last week, had been shot by the leaders of a slave caravan, has since died of his wounds. Two of the murderers of Lieutenant McCausland, R.N., who was killed while in command of the boats of H.M.S. *Daphne*, have been arrested.

THE *Levant Herald* remarks that the investigations of archaeologists have hitherto been directed to objects of early antiquity rather than to those relics of the Middle Ages of which Crete and Rhodes are the principal repositories, but which are found scattered, in the shape of old fortresses and castles, along both shores of the Mediterranean. It appears, however, that a company is now soliciting from the Turkish Government a firman for dredging the port of Rhodes for the bronze guns and culverins committed to the waters in the times of the heroic struggle between the Knights of St. John and the mighty Solymán.

THE Russian traveller, Prschewalski, has been recently lecturing at St. Petersburg on the result of his travels in the interior of China, which began in 1870, and were continued till the close of last year. After penetrating into the very heart of the Chinese empire, accompanied only by Lieutenant Pylzoff, and attended by two Cossacks, with a train of eight camels and two horses, this distinguished traveller reached Peking in the spring of 1871, and after devoting ten months to the exploration of Southern Mongolia, and following the course of the Hoang-ho to the very boundaries of the province Han-Su, he returned to the Imperial capital, to recruit his strength and renovate his supplies. He started again in May, 1872, his purpose being to push on to Lake Kukulnoor, through the valley of the Hoang-ho, but owing to the little respect paid to the Imperial letters with which he was furnished, and the risk of falling into the hands of some of the numerous gangs of robbers by which the route was infested, he found considerable difficulty in making his way, and it was only by joining the caravans, and providing himself with a strong armed escort, that he succeeded in reaching the object of his explorations by the middle of October, 1872. From the almost unknown and hitherto seldom visited Lake of Kukulnoor, M. Prschewalski pushed forward, in spite of dangers of every kind, and after

crossing the Burchau-Buda mountain boundary of Thibet, he reached the Jangtse-Kiang, where, however he was forced to return upon his steps in consequence of the prostration of the camels and horses, and after a tedious journey by way of Alaschaw and Urgu, he finally arrived at Irkutsch, on October 9, 1873. The explorations of M. Prschewalski have shown that the northern course of the Hoang-ho is laid down incorrectly on our maps. He found the Chinese ill-disposed towards travellers, and constantly on the alert to throw obstacles in his way, whilst the Mongolians were friendly, and ready to give information and help in all cases in which they were applied to. These people still continue to cherish numerous traditions in regard to Tchingis-Khan, whose reappearance among them is regarded as certain, and as the forerunner of the restoration of their ancient national renown and the advent of a long-expected golden age.

THE North China branch of the Royal Asiatic Society is in a flourishing condition and full of activity. At the last meeting at Shanghai, we learn that after the appointment of the officers and council for 1874, and the election of honorary and ordinary members, Mr. Cordier read a brief memoir of the late M. François Garnier, the explorer, who was a member of the Society. The President (Mr. F. B. Forbes) then read an address, in which he glanced at the origin and progress of the Society, reviewed the work it had done, gave a short résumé of the scope and value of its journals, and ended with a number of practical suggestions calculated to further its usefulness and popularity. These suggestions relate chiefly to the formation of a museum and the extension of the library, to which he thought might be added a collection of Chinese literature and a manuscript department.

It will be remembered that an International Congress of the Geographical Sciences took place at Antwerp in 1871. The French Geographical Society has now proposed a second Congress, to meet at Paris in the spring of 1875. The programme arranges the subjects to be treated of in six divisions:—(1) Mathematical, Hydrographical, and Maritime Geography; (2) Physical Geography; (3) Historical Geography and History of Geography; (4) Economic and Statistical Geography; (5) Teaching and Diffusion of Geography; (6) Explorations and Travels. Geography is perhaps the ground on which scholars of all countries can meet with most cordiality, and Admiral de la Roncière Noury, President of the French Geographical Society, has strongly insisted on this point in his circular of invitation. An exhibition of objects relating to the study of Geography will be opened at the same time as the Congress, and it is suggested that a special ethnographical collection should be added. Paris contains ample materials for such an exhibition, and the Museum of Ethnography at the Louvre itself is but a shadow of what might be brought together by an appeal to the owners of such treasures on the part of the promoters of the Congress.

THE report by Consul Cowper from Puerto Rico speaks in strong terms of the "piratical system of fines" adopted by the Spanish authorities there. The fiscal regulations, he writes, are probably the worst in the world, and the most difficult to understand; it would almost appear that they were expressly made so, that the heavy fines imposed for any breach of them could not possibly be escaped. The Arancel, or Customs tariff, consists of 136 pages of closely-printed foolscap, the first 50 of which are devoted to the regulations of the Customs, composed of 16 chapters and 330 articles; these are followed by "regulations for the guidance of captains and supercargoes," which are purely traps to catch fines; then comes the list of merchandise subject to import duties, numbering 3,754 articles, and occupying 84 pages of foolscap closely printed. The rules are executed with unrelenting rigour,

no expostulation is listened to, no defence admitted. A notice is issued weeks after the alleged offence, full of errors in date and name of vessel, simply calling upon the captain to pay a fine of so much the next morning. At the Custom-house explanation is evaded, you are informed you may appeal to Madrid; but "appeals to Madrid founder at sea, at all events they are never heard of again." The Royal Mail Company's ships are of incalculable service to the island; they are nevertheless fined almost every voyage, no less than twenty fines having been inflicted during the last three months of 1873.

THE commercial report from Beyrout, recently issued amongst the Parliamentary papers, tells us that the British merchant is being quite driven out of the field by the great competition and better facilities afforded to the natives. The Syrian merchant's life is wedded to his business, and he thinks of and takes interest in nothing else. He quits his dwelling at early dawn, and betakes himself to his store, where he remains till sunset; he then repairs to the café where traders congregate, where he hears the news of the city, the gossip of the petty traders, and the condition of the markets throughout the country, and thus picks up many useful hints which he applies to his own profit. He has little to lose, and, according to the custom of the country, is always allowed time when difficulties beset his path, while in matters of bankruptcy the law is very lenient. Throughout the whole of Syria and Palestine, Beyrout is the only town which possesses an English mercantile house; those of Damascus, and many of those of Beyrout, have long disappeared, driven away by the natural difficulties of trade, and Mr. Vice-Consul Jago has but little doubt that in a few years British trade will lapse entirely into the power of the native.

SHAKSPEARE ALLUSION-BOOKS.

I. Greene on Nash. II. Chettle on Shakspeare.

MR. HOWARD STAUNTON, in a recent letter to the *Athenæum*, tries to show that a passage in the Epistle prefixed to Chettle's *Kind Heart's Dream*, 1592, which has been always considered to refer to Shakspeare, does not so refer; and, incidentally, that the three playwrights to whom Greene addressed his epistle, appended to his *Groatsworth of Wit*, are not Marlowe, Lodge, and Peele, but Marlowe, Nash, and Peele. On the former point I differ from Mr. Staunton, on the latter I agree with him. Perhaps it is worth while to discuss the two points, as Chettle's and Greene's two pamphlets are to be among the first publications of the New Shakespeare Society.

I.—First, with regard to the question whether the "Young Juvenal" of Greene's letter was Lodge or Nash—Dr. Farmer first said it was Nash, but Malone denied it on two grounds; that we know that Greene and Lodge wrote a comedy together, *The Looking-glass for London*, but we know of no comedy written by Greene and Nash; and that Nash was pointed at as the real author of Greene's posthumous letter, which would not be natural if he was one of those to whom it was addressed. Therefore, Malone concluded "Young Juvenal" was Lodge and not Nash. And Shaksperian scholars have generally followed Malone's lead, till Mr. Howard Staunton.

But "Young Juvenal" cannot be Lodge. The chief point which Greene dwells upon is the age of the man he addresses. He is "young," and "boy." Now Lodge was three years older than Greene. In 1592 Lodge was 35 and Greene was 32, neither of them "boys." Lodge was born probably in 1557; he was B.A. July 8, 1577. In 1592 he was a weather-beaten sailor. Greene was born in 1560, and became B.A. at an earlier age in 1578.

Again Lodge was absent from England at the date of Greene's letter. He sailed in Cavendish's second expedition; the ships left Plymouth Aug. 26, 1591, reached Brazil Dec. 15, and remained at Santos till Jan. 22, 1592, when they sailed for the Straits of Magellan on Sept. 13, 1592; the South Sea was sighted, but the ships were driven back into the straits. October 2 they fetched the South Sea again, where they were cruelly buffeted, but recovered the straits a third time. February 6, 1593, they were at Placentia. One of the ships, without victuals, sails, and almost without men came to land, at Bearhaven in Ireland, June 11, 1593. It is not to be supposed that the absent Lodge was one of those to whom Greene addressed his letter, as if they were all present in London at the time.

Again, it is generally thought that Lodge had forsworn writing for the theatre in 1589. The last stanza of his *Scillaes Metamorphosis* of that date contains the lines:—

... "And then by oath he [Glaucus] bound me
To write no more of that whence shame doth grow,
Or tie my pen to Pennio-Kuaves delight,
But live with fame, and so for fame to write."

If he kept this vow, it is clear that his two plays must be dated before 1589. And *The Looking-glass for London*, in which Greene was parcel author with him, seems to have been written early in 1589, for Greene in the dedication of his *Mourning Garment* (1589) to the Earl of Cumberland has some allusions to the matter of the play, which was then fresh in his memory. Thus Lodge and Greene had written a comedy together early in 1589. Is this any proof that Lodge must have been the person whom Greene, three and a half years later, addressed as having "lastly with me together writ[ten] a comedy"? Lastly means "quite lately." It would be absurd to torture the meaning of the word to prop up so weak a conclusion as this, that Lodge must have been the man, because a comedy written by Lodge and Greene nearly four years before happens to have survived, whereas in the general shipwreck of Greene's

dramatic works no comedy avowedly written by him with any one else has been preserved.

Again, Lodge could not with propriety be called a Juvenal in 1592. *A Fig for Momus*, his only satirical work, was not published till 1595. And when he there states that the present instalment was only a trial, and that he had in his hands a whole centon more Satires, which should suddenly be published if those passed, he implies that those then printed were the only ones that had seen the light, or had been submitted to men's judgment. But the satirist whom Greene mentions had already "vexed scholars with his sharp and bitter lines," and they had "reproved his too much liberty of speech." "Young Juvenal" had attacked individuals, and Greene advises him to do so no more. Lodge had never done so. Even after 1595 Lodge was never called "Juvenal." His Satires fell flat, and the world never asked him to publish the store which he had in reserve, or to print a new edition of those he had given forth. Two years after *A Fig for Momus*, Hall published the first three books of his Satires, and in his prologue, oblivious of Lodge, claimed to be the first writer of this kind:

"I first adventure, follow me who list,
And be the second English satirist."

In the controversy about priority between Hall and Marston, no one ever thought of pleading Lodge's indubitable first claim. Perhaps the title of Juvenal, except in irony, would have been the last to be conceded by his contemporaries to this sweet pastoral poet, indifferent satirist, and still less commendable playwright.

Young Juvenal then is not Lodge. Is he Nash?

Nash's age and appearance fit well. He was born in November 1567. He was 7 years younger than Greene, and wanted some two months of 25 years when Greene's letter was written. He was a beardless youth, with a shaggy head of hair, if we may credit his portrait in *The Trimming of Thomas Nash*, where however his open mouth and "lips ugly wrested" might, on a too slight inspection, be mistaken for a hungry beard.

Nash also was a "biting satirist," who since 1589 had been sowing his pasquinades broad-cast, and had already "vexed scholars with his sharp and bitter lines." He had begun writing as Greene's coadjutor, with a preface to *Menaphon*, in which whole classes of the writers of the time were treated with much disdain. The attack was followed up the same year in his *Anatomy of Absurdity*. The Puritans, their favourers, and all who wished to give them a fair hearing, were attacked with wit, malice, buffoonery, and venom in *The Return of the Renowned Cavaliero, Pasquil of England*, 1589, *Martin's Month's Mind*, 1589, *Pasquil's Apology*, 1590, *An Almond for a Parrott*, 1590. The personal war with the Harveys was already begun in the *Wonderful Strange Astrological Prognostication*, 1591. *Pierce Penniless*, 1592, is subsequent to Greene's death, for Nash tells us that he had intended to print an epistle 'to the ghost of Robert Greene' in the first edition of it, had not the fear of infection detained him with his Lord (Whitgift) in the country (at Croydon). Here was abundant material for calling Nash "Young Juvenal." He had already christened himself the Pasquil of England; and "Juvenal," if I remember rightly, was the name given him by Meres in 1598.

It remains to show that Nash and Greene had probably written a comedy together shortly before September 1592. That Greene joined Nash, Lily, and perhaps Kempe in writing the Anti-Martinist plays and pamphlets we have this evidence, among much more to the same purpose. Nash, in his *Strange News*, 1592, explains why Greene attacked the Harvey family in his *Quip for an Upstart Courtier*. He says that Richard Harvey, in his *Percival the Peacemaker*, took upon him to play "jack of both sides twixt Martin and us," and snarled at Lily and Nash himself; and afterwards in his *Lamb of God* reviled Nash and Lily, and "mistermed all our other poets and writers about

town 'piperly make-plays and make-bates.'" Then Greene, "being chief agent for the company," canvassed Harvey and his brothers in the work mentioned above. This shows that Greene was one of those who wrote the plays and pasquinades against Martin, and that they were a company, and wrote in common. Hence it is more than probable that Greene and Nash together wrote one or more of those multitudinous comedies, referred to by Lily in *Pap with a Hatchet*, and Nash in his *Martin's Month's Mind*, and *Pasquil's Return*, some of which only were acted, and those so violent that the children of Paul's were inhibited from acting before October, 1589, and a strict censorship set up over all other companies of actors a month later. But the company's business was not over with this inhibition; nor did the controversy with the Puritans altogether forsake the stage. In 1592 we find it still going on. Early in that year, Lord Strange's company brought out a new play, or rather an old one rewritten, *A Knack to know a Knave*, a "moral" similar to Greene and Nash's *Looking-glass*, consisting of an historical over-plot—in which Edgar stands for Queen Elizabeth, and Dunstan for Whitgift, where Dunstan is treated much as Bacon is treated in Greene's *Friar Bacon*,—and a satirical underplot, in which the puritanical clerical knave comes in for the chief lashing. A careful perusal will show many scenes written by a euphuistic poet like Greene, and many others, pervaded with the glibbing spirit of Nash. I should be loth to affirm that this is the comedy actually referred to by Greene in his letter to the playwrights, but it seems to me to be much more likely to be the play "lastly" written by him and "Young Juvenal" together, than the *Looking-glass for London* is; because for other reasons Lodge, the joint-author of the latter play, cannot be the "Young Juvenal" of the letter.

There is only one other point to notice; it is Malone's argument, that because some contemporaries supposed the letter to be Nash's and not Greene's, therefore Nash could not be one of the persons to whom it was addressed. But surely these readers may have been either careless readers who had failed to notice the two short sentences in which Nash is described, or wary readers who thought that Nash, when he wrote in Greene's name, not impolitely addressed the letter to himself, in order to put guessers off the true scent, and to suggest to them the very same false argument which took in so good a critic as Malone.

Mr. Staunton says that he has "evidence" that Nash and not Lodge is the person intended. If he has any new facts bearing on the point, "I take it there is but two ways, either to utter them or to conceal them." For myself, what I have adduced convinces me that Lodge certainly was not, and Nash almost as certainly was, the person addressed by Greene as "Young Juvenal."

II.—The second point is, whether Chettle refers to Shakspeare in the apology for the *Groatsworth of Wit*. In the Epistle to the Gentlemen readers prefixed to *Kind Heart's Dream*, Chettle says,

"About three months since died M. Robert Greene, leaving many papers in sundry booksellers' hands; among other, his *Groatsworth of Wit*, in which a letter written to divers playmakers is offensively by one or two of them taken; and because on the dead they cannot be avenged, they wilfully forge in their conceits a living author; and after tossing it to and fro, no remedy but it must light on me. . . . With neither of them that take offence was I acquainted, and with one of them I care not if I never be: the other whom at that time I did not so much spare as since I wish I had. . . . I am as sorry as if the original fault had been my fault, because myself have seen his demeanour no less civil than he excellent in the quality he professes: besides, divers of worship have reported his uprightness of dealing which argues his honesty, and his facetious grace in writing that approves his art."

Mr. Staunton bows to the general consent which identifies the first of these two with Marlowe, but not to the equal unanimity which identifies

the other with Shakspeare. For, he remarks, Chettle expressly says that Greene's letter was written to divers playmakers and by one or two of them offensively taken. Now the letter was not written to Shakspeare, but against him.

This is true, and if Chettle wrote with unerring accuracy and with classical refinement he would not have confounded the "ad" and "in."

As the epigrammatist says:—

In libris tria verba meis celebrantur; ad, in, de:
De docet; ad dignos laudat; et in lacerat.

Greene wrote *ad*, to Marlowe, "Young Juvenal" and Peele, and *in*, against Shakspeare. Chettle, if he had been writing with the forethought and care with which a lawyer makes a will should have said that Greene's letter was to divers playmakers and against another. But in common and less fastidious speech the first phrase "to divers" would comprehend the second, and would point out all the persons aimed at in the letter. A Frenchman would say that the letter was directed to Shakspeare as much as to the others: "Ce trait malin est allé à son adresse." The argument, therefore, which builds so much on Chettle's use of the word "to" is entirely unsafe. The assumption of such a prudish precision in him is a precarious hypothesis.

The application of Chettle's words to Shakspeare should be rather tested by facts, than by grammatical niceties. First, we may examine it thus. Greene addresses (so to say) four persons, and says something characteristic of all four. Two of them take offence, and Chettle apologises; the apology ought naturally to fit the offensive remarks. We may see for whom the apology is meant, by finding out to whom Greene addressed the insults which it retracts.

The four objects of Greene were: 1. Marlowe; 2. "Young Juvenal" (either Lodge or Nash); 3. Peele; 4. Shakspeare. The first three he extols, but with some mixture of blame. Marlowe, though the famous gracer of tragedians, had said in his heart there is no God; had an excellent wit, but gave no glory to the Giver; studied Machiavelli, and was a disciple of his political liberty.

"Young Juvenal" was a biting satirist, who made enemies by bitter words addressed to persons not to characters, and who "had vexed scholars with bitter lines," and had in turn been reproved for his too much liberty of speech.

Peele was no less deserving than the other two, in some things rarer, in nothing inferior. He had but one fault, he wrote for the common players, and thereby was worthy of the extreme shifts to which he was driven.

All these three in common were also warned against profane oaths, drunkenness, lust, and epicurean flatterers.

Shakspeare is described as an upstart crow "beautified with our feathers" (by which I believe Greene meant simply an actor who had assumed the part of an author, but which Chettle and others understood as implying a charge of dishonest appropriation of other men's compositions) "a tiger's heart wrapped in a player's hide" (a ferocious ruffian)—one who supposed himself as well able to bombast out a blank verse as Marlowe himself; an absolute Johannes factotum; in his own conceit the only Shakescene in a country; and one who, by favour of his fellows the players, those apes, rude grooms, buckram gentlemen, peasants, and despicable painted monsters, had already supplanted Greene in his calling of playwright, and would soon supplant Marlowe, Peele, and "Young Juvenal" also, unless they were beforehand with him, and forsook the trade.

Chettle's apology is made to two of these four persons. To Marlowe he can say no more than this: that he does not desire his acquaintance; that he reverences his learning; that he hopes he will use him no worse than he deserves; and that he did greatly mitigate Greene's charges against him. To the other he apologises by bearing witness to his "civil demeanour," his "excellence in the quality he professes," his "honesty and up-

rightness of dealing," his "facetious grace in writing," and his "art." These are exactly the points which Greene had assailed in Shakspeare, but had not touched in the cases of "Young Juvenal" or Peele. If Chettle, therefore, dealt out his retraction with any view whatever to the imputations he was retracting, he must have meant Shakspeare, and neither of the others.

Again, if this apology was not addressed to Shakspeare, it must have been meant either for Peele, or Lodge, or Nash. No one has ever suggested that Peele took offence; nor indeed had he reason to be offended. It could not have been Lodge, because Chettle within three months of Greene's death, September 3, 1592, had become acquainted with the man, had witnessed his civil demeanour and his excellent carriage in his profession. But at Christmas, 1592, Lodge was in the Straits of Magellan. Mr. Staunton thinks that it was Nash; but there are several reasons against this. First, Chettle says that the two who took offence, because they could not be revenged on a dead man, wilfully forged a living author; and having tossed it to and fro, having thrown suspicion first on one, then another, at last they fixed on Chettle. In reply to this, he ends his apology by protesting that "it was all Greene's, not mine, nor Master Nash's, as some unjustly have affirmed." This clearly means that the two who took offence in tossing the imputed authorship to and fro, had first fixed on Nash, and then on Chettle. Nash, then, cannot have been one of those two.

But though he was not one of these two offended persons, Nash did take offence at Greene's posthumous pamphlet, or rather, perhaps, at the report that it was his. "Other news I am advertised of," he writes in an Epistle prefixed to the second edition of *Pierce Penniless*, "that a scald, trivial, lying pamphlet called *Greene's Groatsworth of Wit* is given out to be of my doing. God never have care of my soul, but utterly renounce me, if the least word or syllable in it proceeded from my pen, or if I were in any way privy to the writing or printing of it." He was evidently sore that Marlowe and the other [Shakspeare] should have attributed the pamphlet to him, and in his vexation he called it "scald, trivial, lying." "Possibly," observes Mr. Collier, "one of the lying portions of it, in the opinion of Nash, was that in which an attack was made upon Shakspeare." Dyce is surprised at this remark, because Nash was in the same fellowship of playwrights, and must have shared Greene's jealousy and fear of Shakspeare. But, he adds, Nash's offence at the pamphlet resulted from his view "of the probable consequences of such a publication to himself: he was vexed and irritated because its disclosures concerning men with whom he was well known to have associated—the dead Greene and the still-living Marlowe—had a strong tendency to injure his own character; and he boldly pronounced it to be a 'lying pamphlet,' in the hope of shaking its credit with the world." Dyce's observation gains much force from the fact, unknown to him, that at this time, in the autumn of 1592, Nash was the guest of Archbishop Whitgift at Croydon, whither the household had retired for fear of the plague, and that as the official antagonist of Martin Marprelate, he had to keep up such a character as would not disgrace his clerical employers.

A second reason why this "other," to whom Chettle apologises, cannot be Nash, is this. The person was evidently an anonymous writer, none of whose compositions had as yet been published; so Chettle, instead of referring to his books as showing his skill, only brings forward the witness of sundry gentlemen who "reported his facetious grace in writing." Now Nash, as I have shown, had already published a whole series of works. Shakspeare had published nothing, and his authorship of his plays was only known within a very narrow circle.

A third reason is, that Chettle had seen this man's "excellence in the quality he professed."

The man professed some calling which obliged him to make a personal exhibition of himself—such as preaching, pleading, or acting. Shakspeare was an actor. I never heard that Nash was either actor, advocate, or preacher.

A fourth is this; Chettle, at the time of the publication of Greene's letter, was not acquainted with either of the two to whom he afterwards apologised. But he seems to have been acquainted with Nash. Greene reproves Nash for vexing scholars with bitter lines. Chettle in his apology protests that he has, all the time of his conversing with printing, hindered the bitter inveighing against scholars; and in 1596 he signs himself, in a letter to Nash, "your old compositor." It seems as if Chettle had set up some of Nash's satirical works, and had induced him to mitigate their gall. The very title page of *Kind Hearts Dream* bears witness to the familiarity between Chettle and Piers Penniless or Nash.

In the fifth place, the gentlemen who reported to Chettle on the honesty and art of the "other," are much more likely to have been the patrons of the stage where Shakspeare acted, or the private friends among whom his Sonnets circulated, than the reverend circle of Archbishop Whitgift's family at Croydon, among whom Nash's patrons were then to be sought.

I do not claim very great weight for these last four arguments taken separately; but their converging conclusions go to reinforce the peremptory conclusion of the first argument, that the "other" (besides Marlowe) to whom Chettle apologised, was not Nash, but Shakspeare.

No doubt Mr. Staunton has started a difficulty which deserved investigation, but investigation dissolves the mist which he has raised; and he has not established the faintest pretence for asking the new Shakspeare Society to refrain from publishing Chettle's *Kind Heart's Dream* as a book containing a manifest and indubitable allusion to Shakspeare.

R. SIMPSON.

CORRESPONDENCE.

MR. BURNELL ON THE COMMENTATORS ON THE RIG VEDA.

Parks End, Oxford: April 6, 1874.

IN answer to my letter of January 26, printed in the ACADEMY of January 31, Mr. Burnell writes to me from Mangalore, March 10, telling me that he has been unable, as yet, to visit the College of Sringeri, of which Sayana, the author of the great commentary on the Rig Veda, was once the Warden, and where the tradition of his teaching is still kept up.

"I hoped," he says, "to be able to show you how highly I valued your kindness by getting some more information from Sringeri, but in this I have unfortunately not succeeded, owing to the prolonged absence of the Guru on a begging tour."

"The passage you quote about Mādhava Bhatta is very interesting. I have no doubt (as Bhatta is used) that this man was perhaps the rival of Sayana, for in South India this title is by no means complimentary. I hope to find some traces of him, but must write to you again on the subject. Mādhava is so common a name in South India that it is impossible to suppose any Vedantist allegory in this case; nor, if Sayana had a real brother called Mādhava, would he have spoken of him in this way."

"Gayatirhabhikshu's gloss is not uncommon; the author was a monk of Ānandatīrtha's (i.e. Mādhva's) sect, and lived S. 1190–1254. He was the fifth in succession to Mādhvākārya or Ānandatīrtha. There are six MSS. of the whole (?) or parts at Tanjore, but I did not mention it, as it seemed to me purely sectarian."

"It is very uncertain how much of the Rig Veda Ānandatīrtha commented on. I have only seen a small tract containing the beginning, and it is always spoken of by the Brahmins of that sect as

a small work. One, however, at Conjeveram some six years ago told me that he had seen a MS. which was as big as two volumes of your edition of *Sāvāna*, but I doubt this much, as he never could produce it.

"For the same reason I doubt the report of the Benares Brahmans to Dr. Muir about an Atharvaveda Commentary. I have so often had tales told me quite as precise which I have ascertained afterwards to be untrue, that I am very little inclined to believe mere assertions.

"The best Pandits all accept my view of the Mādhava *Sāvāna* question. There are no Pandits, I hear, at Sringeri, and very few Brahmans there who know any Sanskrit at all.

"When the Guru returns I shall visit the place, and do my best to get you a transcript of some of the Rig Veda Commentary there, at all events."

I have only one remark to make. When *Sāvāna* speaks of Mādhava, he calls him generally Mādhava, Mādhavārya or Mādhavākārya, not Mādhavabhāta. But if Bhāta or Bhātās (plural) is now in South India a title by no means complimentary, was it so at the time of *Sāvāna*? There are so many names formed like Mādhavabhāta, that one can hardly suppose they were at the time not complimentary. The great Bhāta, Kumārila, is perhaps more correctly called Bhāta Kumārilasvāmīn, but in Anantabhāta, Āryabhāta, and other names, bhāta always stands at the end. In the Boethlingk and Roth Dictionary Bhāta is mentioned as commonly meant for great scholars, and as distinct from bhāta, a mixed caste, chiefly occupied with composing panegyrics. MAX MÜLLER.

THE EARLIEST ETCHING.

Chelsea, April 7: 1874.

My attention has been called to a mistaken statement in Dr. Willshire's excellent *Introduction to Ancient Prints*. Dr. Willshire repeats the statement, first made, I believe, by Passavant in his *Peintre-Graveur*, ii. 136, and copied by many writers since, that the earliest known impression of an etching is a small print bearing the cypher of Winceläus of Olmutz, and the date in large letters, "Januarii 1496." It represents a monstrous creature having a cloven hoof and a griffin's claw instead of feet, and a human female body with an ass's head, standing on the bank of a stream inscribed "Tavere." Above the head are the words "Roma Caput Mundi," and elsewhere is the date as above. This date would of course set aside the claims of all the artists usually advanced as the inventors of this artistic species of engraving. It would also have a curious importance in another way, for Winceläus of Olmutz copied no less than seven of Dürer's finest inventions, and this early date would reverse the position and make Dürer the copyist, as indeed some writers have suggested. The small print exists in the British Museum, where I examined it carefully and found it to be, not an *eau forte*, but an engraving proper; lines cut by the burin being, under the microscope, easily distinguishable from those corroded into the metal. The earliest etching is not of the same historical importance as the first wood-cut, the St. Christopher, or the supposed first print from engraved metal, the Pax celebrated by Vasari, but still it is of great value in the history of art. I stated the result of my examination in the *North British Review*, January 1870, in a notice of Lacroix's *Les Arts de Moyen Age*, &c., but it appears necessary to restate it.

Further, regarding the curious little print. Lomazzo, "Trattato della Pittura" (4to Milan 1585) describes a monster exactly like that pictured, as having been found in the Tiber at the date 1496. The print is therefore in all probability only an attempt at a later time to represent this fabulous creature, which must have made a sensation. It proves nothing either about Winceläus or the art of Etching, but is a hit at Rome after the fermentation of the Reformation had begun. WILLIAM B. SCOTT.

DR. SCHLIEMANN'S EXCAVATIONS.

April 6, 1874.

There are two points in M. Lenormant's letters on this subject to which I am anxious to call attention.

In the first place Dr. Schliemann finds under his supposed Troy a city of a more ancient, yet more civilised people, of which most unfortunately he takes little note, so full was he of his foregone conclusion that he had found the end of his quest. Here he found a better sort of pottery than in his "Trojan" stratum, and one piece of painted terra cotta. If he had excavated thoroughly this lowest stratum he might have found what would have upset his conclusions on Trojan ground, and, in my opinion this, when done, will prove that the supposed Troy is a city of comparatively late date and the work of a barbarous Asiatic invasion of the Troad, after the beginning of its Hellenic or at least Pelasgic civilisation. How can M. Lenormant reconcile the existence of this earlier city with the conclusion that these objects are of the early date to which he refers them?

But there is another argument which he brings in, as a *point d'appui* for this conclusion, which I can but think to be a grave error, i.e. the date of the articles found at Santorin, and especially the quality of construction, which he describes as identical at Ilissarik and Santorin—viz., hewn stone, &c. Now it must be noted that the great antiquity of the remains at Santorin is assumed from the volcanic action—premises by far too uncertain to be allowed to decide so important a question, but which, on the other hand, must be decided by the archaeological conclusions. A volcano settles nothing. M. Lenormant accepts the Trojan war as an historical event, and certainly his grounds seem to me quite broad enough to justify such a conclusion; and places the city of Ilion (Ilium) in the early so-called Pelasgic period, i.e. anterior to the reputed building of the great Pelasgic works in the Argolide. [And here I wish to be understood as speaking, not of a people, or of the mooted question whether the Pelasgi were a distinct race or not, but simply of an epoch of civilisation in which the wall-building and military engineering which we call Pelasgic was done, and in using this term as designating the race or races who built the cities in Italy, Greece, the Archipelago, and along the coast of Asia Minor (including the remains at Bounarbash), which all belong to one school of work.] Now these walls and tombs belong to a stone-working age, and are entirely executed—if my own most careful examination were not entirely blinded—without the use of any edged tool. Any one who wishes to ascertain if this is correct or not can determine by a crucial test, the "Treasury of Atreus," the stone of which, a hard conglomerate, is split into tolerably regular parallelopipeds, and the cap-stone of the door, which measures about 27+16+4 feet, shows plainly on its inner surfaces that all the finish it has had is by trituration, the flinty nodules which protrude from the plain surface shewing the scratches of rubbing on their summits. I examined carefully every accessible piece of work in the Argolide, and found everywhere the same tokens of being finished by attrition, whatever the substance may be, and while the conglomerate is split into shapes with nearly parallel faces, the lime-stones, whose fracture is polygonal, give rise to the familiar polygonal form of Pelasgic work, but in the former case they seem to have been split, and in the latter either found in masses or broken out so, and faced up nearly in their original shapes by confusion, much as stone-cutters do now in rough facing, but in every case the finishing, if any, is the same. I climbed up on the Lion of Mycenae and examined carefully the parts protected from the weather, and found, if I am not entirely mistaken, that this sculpture, the oldest of all art sculpture known to us, is done in a method analogous to that employed in the Etruscan intaglii—round holes drilled to make the principal part of the cutting, with the intervening material rubbed

away. In some of the undercuttings the bottoms of the drill-holes were almost as close to each other as they could be without opening into each other. In the citadel of Argos, which is of the latest style of pure Pelasgic work—i.e., stones cut polygonally, laid in parallel courses—the evidence was the same as to the use of cutting tools.

In my opinion the ruins at Mycenae will better repay careful excavation and study by archaeologists than any other of the familiar sites, as being the crowning work of the Pelasgic epoch, and the most perfect piece of military engineering of the heroic days remaining to us, although, owing to the late period of its conquest, work of all the classic centuries may be found, but I shall be very much disappointed if the earliest deposits do not prove that the builders were stone-workers, and without any knowledge of hardened metals at a time when Egypt could work granite with ease.

M. Lenormant's conclusion, that this early civilisation had no connection with Egypt or Assyria (letter in ACADEMY of March 21) is thus farther confirmed, if my notions are tenable, and we must place the beginnings of Pelasgic (and thence Hellenic) civilisation in the neo-lithic ages, and independent of Egypt. There are some other data given by M. Lenormant which, when placed in relation to each other and certain admitted archaeological conclusions, put the history of the eastern Mediterranean in a clearer light; always, of course, supposing that the reasoning on the data given is just, and these I shall ask your permission to discuss at some future time.

W. J. STILLMAN.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, April 11,	3 p.m. Crystal Palace Concert (Hallé, Norka, Piatti).
	3.45 p.m. Royal Botanic.
	8 p.m. M. Gounod's Concert (last of the season). St. James's Hall.
MONDAY, April 13,	4 p.m. London Institution.
	8 p.m. Society of Arts: Cantor Lecture on "Carbon."
	8.30 p.m. Medical.
TUESDAY, April 14,	1 p.m. Sale of the Marquis of Salamanca's collection at Christie's.
	1 p.m. Sale of Engravings at Sotheby's.
	3 p.m. Royal Institution: Professor Rutherford on "The Nervous System."
	8 p.m. Society of Arts: Mr. Swanzy on "Trade in Western Africa."
	" Royal Medical and Chirurgical. Civil Engineers: Discussion on "Fixed Signals of Railways."
	" Photographic. Anthropological.
WEDNESDAY, April 15,	1 p.m. Horticultural.
	4.15 p.m. Royal Society of Literature.
	7 p.m. London Institution: Prof. H. Morley on "English Poets of the Nineteenth Century." II.
	" Meteorological.
	8 p.m. Society of Arts: Mr. H. Cole, C.B., on "The Proprietion which Investments in the Purchase of Objects of Fine and Industrial Art ought to bear to the National Income and Expenditure."
	" Geological.
	" Grand Opera Concert (Titiens, &c.), St. James's Hall.
THURSDAY, April 16,	1 p.m. Sale of Engravings at Christie's.
	3 p.m. Royal Institution: Mr. W. No. 1 Hartley on "The Atmosphere and its Relations to Life."
	4 p.m. Zoological.
	6 p.m. Royal Society Club.
	7 p.m. Numismatic.
	8 p.m. Linnean. Chemical.
	8.30 p.m. Royal Society: Mr. W. H. Barlow on "The Pneumatic Action which accompanies the Articulation of Sounds by the Human Voice, as exhibited by a Recording Instrument." Mr. J. B. Hennessey on "The Periodicity of Rainfall." Dr. W. Roberts on "Biogenesis."
FRIDAY, April 17,	" Antiquaries.
	8 p.m. Philological: Mr. Sweet on "History of English Sounds." II.
	" Society of Arts: General Sir Arthur Cotton on "The Indian Famine."
	9 p.m. Royal Institution: Mr. W. Spottiswoode on "The Composition of Colours by Polarised Light."

SCIENCE.

Etruscan Researches. By Isaac Taylor. (London: Macmillan & Co., 1874.)

Second Notice.

MR. TAYLOR says himself that he has not thought it necessary to translate any of the longer Etruscan Inscriptions. There is no attempt, therefore, in his book at anything like a minute grammatical analysis. We look in vain for phonetic laws, and even a skeleton of declension or conjugation, the mainstay of every truly scientific decipherment, is wanting. He gives explanations of some of the most prominent words which occur in Etruscan Inscriptions, such as AVIL, RIL, LEINE, LUPU, TEKE, PHLERES, TENINE, TURKE, THUI, SUTHIL, SUTHINA, ALPAN, EKA, KEN, MI, ETERA, KANA, KLAN, LAR, LARTH, PUJA, SEK, ZILACH, and tries to trace them back to some Turanian dialect. But though, in some cases, we understand the feeling of satisfaction with which he propounds his identifications, we feel in most of them an utter absence of what would carry conviction to any one who has read the works of Stickel, Lorenz, Donaldson, Ellis, or Lord Lindsay. Has not Mr. Taylor read the works of his predecessors, and has he not found in them similar identifications which, if taken by themselves, are very startling, but which never lead to anything else? I think that anybody lighting on Mr. Taylor's explanation of *Kulmu*, the god of death, would feel at first the same pleasure which he felt himself, when he saw on the sarcophagus of the Aphuna family the deity labelled *Kulmu*, bearing in one hand the flaming funeral torch, and in the other the emblematic shears, the personification of the spirit of the grave; and when he afterwards found that among the Finns the deity ruling over the tombs and their inhabitants is called *Kalma*. Such a coincidence is quite sufficient to serve as a scent, and to be followed very carefully; but unless it leads to a number of similar coincidences, it is of little value. Now, in the case of *Kulmu*, we find, first of all, that the Finn runes tell us very little about *Kalma* and his family, and that among cognate races not even the name of that deity seems to be known. Secondly, *Kalma* among the Finns is a male deity, whereas the figure on the Etruscan sarcophagus, marked *Kulmu*, is certainly that of a female. In spite of this, the identification of *Kulmu* and *Kalma* is certainly very clever. A dozen more of such coincidences would startle any unprejudiced reader, but as it stands alone, as it is the gem of the whole book, we must leave it as simply curious, and nothing more. The other deities which Mr. Taylor tries to explain from a Finnish source yield hardly any results. If *Vanth* means death, and if, as Mr. Taylor says, *th* and *t* serve to form abstract nouns in Etruscan, then the Aryan root *bhāna*, from which the Norse *bana*, to kill, A.-S. *bana*, murderer, O.H.S. *bano*, death, would answer far better than any real or imaginary Turanian root adduced by Mr. Taylor. As to *hinthial* meaning ghost, or literally, "image of the child of the grave," from *hin*, spirit, *thi*, grave, and *al*, child, such a compound is impossible in Turanian as well as in any other language. The syntactic formula of Turanian compounds is *b.a.*, as in *thi-al*,

grave-child, but never *a.b.*, as in *hin-thial*. If *thial*, grave-child, were a Turanian compound, then the next compound could only be *thial-hin*, gravechild-spirit, and never *hin-thial*. This touches the very vitals of language, yet Mr. Taylor passes it over without any misgiving (see *Letter on Turanian Languages*, p. 230).

I believe that these are some of the most plausible identifications which Mr. Taylor has attempted, and yet how little conviction do they carry even to those who are willing to be convinced. Every word that he professes to explain from Turanian requires a new effort, nothing seems to come natural. Now, if once the right track is found in deciphering an inscription, such is the organic coherence of language, that every new step shows us more plainly that we are on safe ground, every new experiment brings us confirmatory evidence. It might be said that Mr. Taylor's identifications ought one by one to be proved to be wrong before we reject his theory. But this is really asking too much. That there is a certain outward similarity between the Etruscan words and the words which he has selected from Turanian dialects is not denied. All we can say is that, with the same effort—nay, with a much smaller effort—these very same Etruscan words could be traced back to many other languages. Admitting, for instance, *VARI* to mean red in Etruscan, Mr. Taylor traces it to the Suomi *veri* blood, and to the Turkish *verd*, rose. But *verd* in Turkish is a Persian, i.e. an Aryan word, though no one would quote it in explanation of Etruscan *VARI*.

If *KAHATI* means violent, and is to be traced to Tungusic *kata*, fierce, we have *kaṭu* in Sanskrit, which means equally fierce.

If *KIARTHI* means swarthy, and is to be explained by Turkic *kara*, black, we have *kāla*, black, in Sanskrit, from which *kālī*, the black goddess.

If *THAPIRI* means black, and is to be explained as an intensive form of *KIARTHI*, or an abraded form of *kap-kara* (though it is difficult to see how), we have a much nearer explanation in Gr. *τεφρόεις*, ash-coloured, which requires no abrasion.

Thus we might go on for ever in order to show that Mr. Taylor's method is at fault, or proves too much, and that, even if Etruscan were a Turanian language, the proof of it must be of a very different character. I hope it will not be supposed that I consider the Aryan words which I have quoted as really connected with the Etruscan words: all I wish to show is, how easy and how useless this method of interpretation really is.

Nothing I should like better than if the Etruscan could be proved to be a Turanian language. It would solve many difficulties, it would square with many of my own ethnological theories. I do not even now, after reading Mr. Taylor's book, go so far as to say that Etruscan cannot be a Turanian language. All I say is, that Mr. Taylor has not proved it, and that his method is not what it ought to be.

What shall we say to Mr. Taylor spoiling even so good an identification as that of *Kulmu* and *Kalma*, by comparing these names with the Indian goddess *Kālī*, and by adding, "The Lesghic *kol* is a mouth,

and in Coptic *chol* is tooth, *khol* a cavity or cave, *mhaou* the tomb, and *mou* death. We may explain and combine these abraded fragments of the ancient Turanian word, if we remember that *Orcus* is represented as the toothed and gaping mouth of Hades, and that the word *Orcus* may be explained by means of the Basque *ortz*, a tooth." Any scholar, be he Aryan, Semitic, or Turanian, after reading such a sentence, would feel justified in shutting up the book. If *kalma* comes from a root which means death and decay, what can it have to do with Coptic *chol*, tooth, even if the Latin *Orcus* were the toothed mouth of Hades? And how are Coptic *chol*, tooth, and *mou*, death (why not Hebrew *muth*, to die), to come both from the Finnish *kalma*, meaning the grave, or the smell of a corpse?

When Mr. Taylor compares the Etruscan *nusthicei* with Turkish *eshdiha*, dragon, is he quite sure that the Turkish *eshdiha* is not our old friend the Persian *azhdahā*, the Zend *azhi dahāka*, the Greek *Astyages*, the Arabic *Zohhāk*, all of purely Vedic parentage? At what time then are we to suppose that the Etruscans borrowed it from the Turks, who themselves had borrowed it from the Persians?

Such things ought not to be, yet they happen almost on every page. Thus we are told on p. 136—

"that in Samojed *nom* means God, and *men* house. The Ostiak word *noman*, heaven, of which the Permian and Hungarian words are abraded forms, would therefore be the abode of God. The Latin word *numen* seems to be the same as the Ostiak *noman*, and to be derived from the Finnic substratum of Italy."

Now, first of all, Castren tells us that the Samoyed *num* is most likely the regular representation of the Finnish *jum* in *jumala*, God, which means the god of thunder, and is derived from the same source as *jumu*, thunder, *jumans*, rattling. But, even if it were not so, are we to go to Finland to explain *nū-men*, nodding, command, will, power, and last, *deūn numen*, the power of the gods, from *nom-men*, god-house, and not from *nūere*, to nod?

In the same note we are told "that in Yakut *mūna* means broad, and *mūnatanara* the immeasurable heaven, while in North American *Manitou* is heaven-god." But there can be no connexion between *Manitou* and these Yakut words, for *Manitou* has a perfectly well-ascertained etymology in the North-American languages.

On p. 21 we read that *Grisons* may be a corruption of *Rasenna*. Surely the *Graue Bund* of 1425 and the modern *Grau-bünden* offer a nearer explanation.

On p. 24 we read: "Is it too much to conjecture that the Greek *Turhene* may be identically the same as the Persian form *Turan*?" But the Persian plural *Turān* comes from the Sanskrit *tura*, which means quick, and from which we have *turaga*, horse, *turanga*, horseman, *turcāsa*, an ethnic name, &c.

Again, why should the name of the *Mardi*, a Median tribe, be derived "from the Finn gloss *mart* or *murt*," men, when we have the Sanskrit *marta*, man, the Persian *mard*? Why should the name of *Darius*, whether it meant *φρόνιμος* or *ἐκτωρ*, be derived from

Esthonian *tark*, prudent, or Lapponian *tjar-rok*, rigid, when it has a perfectly satisfactory etymology in Persian?

I shall not maintain that the etymology of *Camillus* and *Camilla* is quite certain; but it is quite certain that the old form of the word was *Oasmillus*, and to derive this from Turanian words, such as, for instance, Turkish *hammal*,* a porter, and to suggest that *camel* too, may be of Turanian, not of Semitic origin, and mean the carrier, is to defy at the same time the highest authorities in classical and Semitic scholarship. *Gemel* in Arabic does not mean camel in general, but, according to Wetzstein, is a name given to the *ba'ir*, after it has attained its seventh year. It therefore may have meant originally the strong or perfect animal, but at all events we may feel certain that the Bedouins of antiquity did not call their camel by a foreign name.

What will classical scholars say, when they are told that *genius* is to be explained by the Turkish (?) *jan*, soul, and not by *gigno*, *ingenium*, &c.; that the *penates* are the *Buni*, formerly worshipped by the Tungusians, and have nothing to do with *penus*, *penitus*, *penetrare*, *penetralia*, &c.; that the great *Diana* derives her name from the Turkish *tan*, that *Janus* and *Juno* are of Finnic origin, instead of deriving their names from the root *Div*, to shine, which has given names to so many *divine* powers of the ancient Aryan Pantheon? We can hardly trust our eyes when we read that Etruscan *Ausel*, the dawn, derives its name from a Turanian root *sil*, when we have the Latin *aurora* for *ausosa*, *aurelius* for *auselius*, &c.; that the name of *Ceres* comes from Ostiak *kyra*, and Lapponian *aker*, a field, whereas the Lapponian *aker* is probably a word borrowed from German, while *Ceres* is the Sanskrit *sarad*, harvest. Are we really to believe that Lat. *cliens* is the Etruscan *klan*, which means child, and is the Turkoman *oglan*, when we know it means obedient, *hörig*, from Latin *cluere*? If *capra*, she-goat, was an Etruscan word, as Hesychius says, have we to trace its origin to Lapponian *habra*, goat, when we have Gr. *κάπρος*, Old Norse *hafr*, A.-S. *hāfar*, Old Slav. *vepri*, when, in fact, there can be little doubt that the Lapponian *habra*, the Karelian *kapris*, the Livonian *kabbör* are all derived from an Aryan source? The Latin *toga*, a perfectly regular derivative from *tego*, like *roguis* from *rego*, is to be identified with the Samoyedic *toho*, shirt! *Velum*, a sail, i.e. *veallum*, or *veh-clum*, from *vehere*, is to be *voilock*, the name given by Tatar tribes to the felted sheets of which their tents are constructed. *Arbiter*, the interesting Latin word which, though not derived, is closely connected with *arbitere*, is said to have no Aryan chronology, and is traced back to *arbi*, the Finnish *arpi*, a lot, a divining-rod.

This is but a small list of passages from Mr. Taylor's book which I think no scholar could read without shivering. It might have been made much longer; but, as it is, it will suffice for showing that Mr. Taylor, before attempting a task that has baffled the best scholars, has not even made himself

acquainted with the simplest rules of Comparative Philology.

Mr. Taylor is more successful in his remarks on ethnology and architecture. In what he says about the characteristic features of the Turanian tribes, of their style of building, their laws and customs, there is much that is curious and deserves attention. But here also his statements are often far too general, and we should like to have the authoritative opinion of Mr. Fergusson on such a subject. When Mr. Taylor speaks of the warriors being buried with their spears and arrows, that is surely not exclusively Turanian, nor can it be said that the cultus of the dead is utterly foreign to the thoughts and feelings of Aryan races. There is a purely human element in these customs; and this we find again in India and Germany as well as among Turanian races, though there are other less purely human and intelligible elements which may enable us, though not without great caution, to carry out an ethnological classification of ancient customs and manners. Mr. Taylor has laid down a number of "Ethnographic Notes" as characteristic of Turanian races. A not unfriendly reviewer, however, in the *Times* has pointed out very pertinently how many of the most significant of these are likewise found in Carthage.

"The Carthaginians, he says, were a dominant aristocracy in the midst of subject races. Dr. Arnold notes their isolation. Their genius for conquest and empire was conspicuous. They were given to sorcery. They were highly conservative. And they sustained one of the most obstinate sieges in the world's history. More than that, both Carthage and Etruria were great maritime Powers, who, instead of being rivals, were fast friends, united by numerous treaties, and fighting side by side against their common enemy, the Greek."

Not even Mr. Taylor, however, would claim the Carthaginians as Turanians.

If Mr. Taylor had simply not proved an Etruscan Oedipus, he would have deserved small blame, where so many have failed before him. But the method which he has followed admits of no excuse; and no one who has the true interests of the Science of Language at heart could have spoken of his book with less severity than I have. It is true that it is a standing reproach to that science, that no clue has yet been discovered to the Etruscan inscriptions, and that the Etruscan therefore remains without a place in the genealogical system of languages. There is, however, every reason to suppose that Dr. Corssen has found a clue, and that in his great work, to which he has devoted so many years, he will give us not only a *Corpus Inscriptionum Etruscarum* that can be depended on, not only a translation of the ordinary words, like those mentioned at the beginning of our article, and of all the inscriptions, not excluding the *Cippus Perusinus*, but a grammatical analysis of the language, without which no decipherment can claim a truly scientific character.

MAX MÜLLER.

THE Académie des Sciences has elected M. Bréguet, whose researches on electric telegraphy are well known, to fill the chair of the late M. Antoine Passy.

A System of Logic. By Dr. Sigwart. Vol. I.: *The Theory of Judgment, Conception, and Syllogism.* (Logik, von Dr. Christoph Sigwart, Professor der Philosophie an der Universität Tübingen: Erster Band, die Lehre vom Urtheil, vom Begriff, und vom Schluss. Tübingen, 1873.)

It is evident that the example of Mr. Mill's system of Logic has had some effect upon the form, and partly also upon the contents, of Professor Sigwart's work. A first or elementary part, which sketches the grammar of judgment and reasoning, in greater or less dependence upon the ordinarily accepted doctrines, is followed up by a second or "Posterior Analytic," which discusses the relation of our scientific theories to the perceptions on which they are avowedly based, and examines the nature of what is called experience. The former of these problems can scarcely be touched, without constant reference, implicit or explicit, to the teaching of Aristotle. The latter is as indisputably in the main a modern problem, and is almost as closely associated with the great work of Kant. It is only with the first of these questions that we are concerned in this volume, which therefore takes up the same themes as the first two books of Mr. Mill's *Logic*. But if the general features of the subject-matter are the same, the mode of treatment is very different.

The researches of Prantl, in his *History of Logic in the West*, have rendered an indispensable aid to those who in modern times would reform the traditional theory. By tracing the various and abnormal accretions which in the course of ages substituted themselves for the Organon around which they grew, he has made it possible to separate the genuine logic of Aristotle from the doctrines held under that august name by the pupils of commentators and schoolmen. It is now apparent that many features of logical teaching which had a reason and meaning in the Aristotelian mode of thought lost that meaning when they were ignorantly retained amidst strange environments and an altered estimate of science. The abundance of this historical light is what gives the advantage to the Epigoni of German philosophy over their greater predecessors. It was the want of such light that led to the blemishes in the modern rehabilitation of the Organon, known under the name of the Formal Logic. And as the whole of modern logic, with one single exception, has been an attempt to remodel Aristotle and utilise him for the new fields of knowledge, it is obvious that nothing valuable can be accomplished on this ground, save by those who have traced the steps in that process by which the hereditary nomenclature of logic has suffered a general and gradual displacement. The works of Ueberweg and Trendelenburg have set a good example in this direction; and although Dr. Sigwart has little of the parade of erudition, and is entirely wanting in historical "cram," his endeavour to modify and reform the traditional theories of logic is not on that account less successful. For the present, indeed, there is only a preliminary skirmish on the logical battle-field; and the real fight is yet to come. We can see, however, from the specimen before us, that the author is a

* Professor W. Wright, in an excellent article in the *Athenaeum* of March 28, shows that *hammal* in Turkish is a borrowed word, the Arabic *hammal*.

master in the art of subtle and discriminating analysis, which enables him to dissipate many errors of long standing, and clear up much vague or confused terminology; and we must wait for the next volume (which is promised in the course of a year) to see if he also has the higher philosophic power which can give meaning and depth to that much misused term Induction.

The main, and almost the sole object of this volume is the theory of the Judgment, or, as some people prefer to call it, the proposition. Subordinate to this comes an account of the means used to define and determine the conceptions entering into the judgment, and a theory of the grounds which justify the synthesis of the two conceptions. Our intentional thinking has for one of its aims the formation and enunciation of syntheses between its conceptions and its perceptions—syntheses which claim to be valid for everybody, in other words, to be necessary and true. Such action has a natural phase, based upon the common stock of words and ideas and common exercises of perception; it has also an artificial phase, when the ideas are perfected and the meaning of the words accurately fixed, and when analysis has reduced the total vague conception of natural thought to an artificial product of complex structure with a distinct articulation. The existence of this natural phase being assumed, the next thing is to determine its precise mode of operation in various circumstances, to show the principles upon which its action is the commentary, and finally to indicate the ideal to which it ought to approximate, if it is ever to pass into the higher or artificial stage of scientific thought.

In its earliest shape, then, a judgment is the consciously-made but unhesitating recognition of a previously-acquired conception (the predicate) in a subject presented by the senses. Without analysis of the steps by which the synthesis of conception with perception is brought about, without comparison of the two terms part by part with each other, an instantaneous act of recognition or identification is ratified by the expression of a judgment. Such an act is tacitly accompanied with the conviction that it is valid for others as well as for the person who makes it. The very utterance indeed is meaningless apart from that presumption: for the simple statement of a judgment means to enunciate an objective truth, what *is*, and not what *we think*. That belief in its objective validity lies at the very root of thinking in this form of its exercise. But this objective validity, according to Sigwart, has nothing to do with the belief in a real external world of being. The latter question logic must decline to examine.

But this very act of judgment by which we bring our conceptions into union with one another may become itself an object to our reflective judgment. The union of the two conceptions, instead of being immediately formed, may be a question calling for decision. The proposed judgment is itself upon its trial, and the possibility of the synthesis or identification is the object of our judgment. Instead of enunciating the synthesis, and thereby claiming validity for it, we may subject it to our criticism. And thus, in the first place, in passing judg-

ment upon the proposed judgment, we may reject it. This gives rise to the negation, which, accordingly, instead of being on a level with the affirmative proposition, is really a judgment upon a judgment. It is an act of condemnation passed upon the copula, and forbids its employment. But in some cases we may be able to go no further than to declare that the question is not at present answerable: that the synthesis may be made, but may also be declined. This is the expression of subjective uncertainty, or of possibility. Thirdly, it may be replied that the synthesis is a valid one, and must be completed, if certain conditions have previously been complied with. This is the hypothetical necessity, and it is the only necessity to which human knowledge can ever attain. In this, however, there are two degrees or grades of necessity. In one case the truth is necessarily valid, because it forms part of a general system or totality of human knowledge, in which every part is so bound up with every other, and with the whole, that it must stand or fall along with it. Such is the security or necessity of the belief in the objective validity of our several perceptions, and in the absolute truth of the axioms and postulates of experience which are invoked to authorise the methods of inductive science. In the other case, the dependence of consequent upon antecedent ground is not so far-reaching as when the fundamental principles of science are necessarily postulated by the fabrics which they hold together. On the contrary, it is now only the dependence of one single case upon another, or upon an ascertained rule. The hypothetical necessity of the statement presents a definite antecedent and a definite consequent.

The theory of syllogism to which we are thus introduced exhibits considerable divergence from the ordinary treatment of that topic. The hypothetical syllogism, so-called, becomes the typical form of all syllogistic reasoning; and that position it owes to the peculiar distinctness which it gives to the relation of necessary sequence between the ground and its consequent, instead of the distinction between universal and particular on which the categorical syllogism is said to be founded. As Sigwart points out, these terms, universal and particular, are often misunderstood. Perhaps in their literal sense they denote a definite number (all or some) fixed by observation, and capable of being numbered. But they have come to express a very different relation of thought: the one, the necessary, and the other, the merely possible or contingent combination of the terms in a judgment. And it is therefore proposed by the author that, in order to avoid the misleading suggestions which interpret the (really) necessary *nexus* into a merely experiential generality, the categorical form should be set aside and replaced by the more significant form of the hypothetical syllogism. If this view be adopted, the objections made against the syllogism, on the ground that the major premiss is a luxury of argument and affords only a collateral security, may be rebutted. "It is only when the several single data prove necessity, that they can be used to prove any other single case" (p. 406). It

must be remembered, indeed, that the accepted theory of syllogism proceeds on the assumption of a cut-and-dried collection of concepts, with their order, contents, and value previously fixed, and then arranges them by the rules of arithmetical permutation. It presupposes (what is a fiction) that all things in heaven and earth have been classified and defined, and their relations precisely specified. In such a fool's paradise of knowledge the syllogism would have the holiday task of setting forward ceremoniously what was already as well known without the display. But by its author the syllogism was meant to be a means of bringing about that very knowledge, preserved in definitions, which the traditional logic boldly assumes as its starting-point. Looked at from this point of view, the three figures of the syllogism hold their ground against some forms of criticism. The first and second, taken together, represent the two sides of the principle of all reasoning: that when the antecedent is valid, then the consequent (whether affirmative or negative) is also valid, and that the invalidity of the consequent brings with it the invalidity of the antecedent. In either case a hypothetical necessity is reached. In the third figure, on the contrary, the conclusion is merely a possibility (for that is the meaning of the ambiguous "Some"), and not a necessary truth.

There are other points of interest which we cannot do more than notice. Such are the remarks on the copula, its relations with the substantive verb, and its representation by the inflection in general (p. 93); the explanation of the principles of contradiction and excluded middle as meaning no more than an explicit statement of the nature of negation, and of its relations to affirmation (p. 144), just as the principle of identity is interpreted into a guarantee of the validity of our simplest judgments (p. 81); the distinction drawn between a numerical (or empirical) generality, and the universality of thought which is another name for necessity (p. 171); the discussion of the nature of possible and necessary, as supplementary to the distinction just drawn between universal and particular (p. 187); and the suggestion of an analysis of a conception into its simple binding elements, which, according to our author, is a work reserved for future philosophers (p. 287). There is much that is new and valuable in these chapters. One could sometimes wish that the minutiae of the analysis, and its divergent movements were kept more under control and the main outlines brought more firmly into light. On the vexed suit between reality and ideality, with its minor issues on the point of subjective *versus* objective, Dr. Sigwart seems mainly to adopt the position of Kant—substituting, however, for the *Ding-an-Sich*, the apparently simpler term *das Seiende*. The simplicity is gained, perhaps, at the cost of scientific accuracy in language and thought, and seems to rest upon a confusion of ideas. But apart from these metaphysical doubts, his work is a welcome contribution to science, and will suggest lines of examination to those who may not find it in all respects conclusive.

WILLIAM WALLACE.

NOTES AND NEWS.

THE action of light on selenium forms the subject of some interesting experiments communicated by the Earl of Rosse to the *Philosophical Magazine*. Selenium is a substance akin to sulphur, occurring like it in three states, viz., amorphous, vitreous, and crystalline; in the last condition Mr. Willoughby Smith found that light acted on it in a very remarkable manner, increasing very considerably its resistance to the passage of electricity, which it conducts very badly. This effect was well exhibited at the soirée of the Royal Society last year, by means of a Thomson reflecting galvanometer; the spot of light reflected from a small mirror carried by a light magnetic needle moved to a different position when a strong light was thrown on the stick of selenium which formed part of the galvanic circuit, showing thereby that the current was greater, and therefore the resistance of the selenium less, in consequence of which the needle, round which the galvanic circuit was coiled, was deflected further by the increased action of the electricity.

Lord Rosse has made further experiments in a similar manner, chiefly with a view to testing the applicability of selenium to measuring the heat of the stars and moon; but it appears that heat produces no effect on the electric condition of this strange substance, for the same results were obtained from the action of a candle when a glass screen (which cuts off nearly all the heat rays) was interposed, as without it, and a more direct test, a vessel of hot water, produced no effect at all.

The thermopile, which has already done such good service in Lord Rosse's hands, appears then to be the best instrument for measuring the minute quantities of heat which reach us from the moon and stars.

It seems, too, that the idea of using selenium to measure the brightness of the heavenly bodies must be abandoned, the action of light being but small, and apparently irregular. With all its defects, the eye remains superior to anything yet discovered for photometric purposes.

THE annual volume of the Washington Observatory has just been issued for 1871, and, like all similar publications, is remarkable for the enormous mass of figures contained in it. As a frontispiece, a photograph of the large telescope just erected at the Observatory is given; this fine instrument has an object-glass of twenty-six inches aperture (beating by one inch the splendid refractor made for Mr. Newall by Messrs. Cooke, of York), and is equatorially mounted with clock motion. A sum of 50,000 dollars was voted by Congress for its construction. In an appendix to the volume is given an interesting memoir on the founding and progress of the Observatory, by Professor Nourse, and in another appendix a still more important contribution to astronomy in the shape of a catalogue of more than ten thousand stars observed between 1845 and 1871, and of which the places are given with the greatest accuracy. It is with regret that we learn that Admiral Sands retires from the direction of this Observatory, being superannuated by the rules of the United States Naval Service.

A DISCUSSION has arisen between Mr. Birmingham and Professors Argelander and Schönfeld as to whether a remarkable red star, given in the list formed by Schjellerup, and which is now not to be found, did ever really exist in the heavens. Argelander could see nothing of it in 1853, though it was observed twice previously by Sir John Herschel; but then the latter observer may have made a mistake each time in the star's place, for there is another red star near which he has not alluded to, but which he may really have observed; it is, however, not at all likely that the same mistake should have been made twice over and in both elements, the missing star being about a minute of time further east and nine

minutes of arc further south than the other. Besides, Mr. Chambers appears to have seen both at some period between 1869 and 1871, and Secchi actually describes the spectrum of the star in dispute, so that it looks as if both disappeared alternately. Now that attention has been called to the question, the matter will probably soon be settled.

SOME elaborate measures of the length of the pendulum vibrating seconds have been made by Dr. C. F. W. Peters at Königsberg and Guldenstein, for comparison with those formerly made at the same places by Bessel and Schumacher respectively. The principle on which such determinations depend is that, if a point of suspension be found in a pendulum (usually a cylindrical rod) which will cause it to vibrate once in a second exactly, and if the pendulum be then inverted and a similar point found near the other end, the distance between the two points will be the exact length of the simple seconds pendulum, which is supposed to consist of a heavy particle suspended by an infinitely thin spring, a condition of things only to be attained in theory. The results found by Dr. Peters at the two places agree well with the earlier measures, being one two-thousandth of an inch greater and less respectively. Since the force of gravity makes the pendulum swing, its time of vibration will depend on the amount of the force, so that by determining the length of the seconds pendulum at different parts of the earth, which comes to the same as finding the time of vibration of the same pendulum, it is possible to determine the force of gravity at different places, and hence the shape of the earth. The enquiry is, however, a very delicate one, as the slightest change of temperature affects the length of the pendulum.

JUDGING from the Annual Report of the Council of the Royal Astronomical Society which has just been published, and which extends to over a hundred pages, astronomers appear to have been unusually active during the past year. The most important features of this report are the chronicle of the doings of the various British observatories, public and private, the notes on the progress of astronomy, which give an instructive summary of the work of the year, both at home and abroad, and the address of the President (Professor Cayley) on presenting the medal to Professor Newcomb for his tables of Uranus and other researches.

A VALUABLE series of drawings of Jupiter made with the three-feet reflector of Lord Rosse's observatory has been chromo-lithographed, and the impression presented with explanatory notes by Lord Rosse to the Royal Astronomical Society for publication in the next number of the Monthly Notices.

WITHIN the last few months an addition has been made to the list of the "learned societies," under the name of "The Physical Society of London." The objects of this Society are stated in the bye-laws, which have just been printed, to be "to promote the advancement and diffusion of physics. It is not intended under the general denomination of Physics to include the details of chemistry, astronomy, or the special branches of natural science for the pursuit of which other societies are already formed. In furtherance of these objects the members of the Society shall meet at stated intervals, for the hearing and discussion of communications relating to physics; for the exhibition of new or improved Apparatus for physical research; or of new experiments illustrative of physical laws. Written or oral communications shall be accompanied, whenever it is practicable, by experimental illustration, and the exhibition and use of the apparatus referred to in them." The first officers of the new Society are: President, Dr. J. H. Gladstone; Vice-Presidents, Professors W. G. Adams and G. C. Foster; Secretaries, Professors E. Atkinson and A. W.

Reinold; Treasurer, Professor E. Atkinson; and Demonstrator, Professor F. Guthrie.

PROFESSOR GERSTÄCKER communicates to the *Sitzungsberichte der Gesell. Naturf. Freunde zu Berlin*, for 1873, two remarkable instances of protective mimicry among insects. One is that of a species of Ichneumonidae, *Crypturus argiolus*, which differs altogether in colour from the ordinary black and red hues of its tribe, and accurately imitates even in its minute details that of the wasp, *Polistes gallica*, on which it is parasitic, while after death the resemblance in colour altogether ceases. The resemblance is even carried out to the extent that variations in the colour of the wasp, which are characteristic of the different portions of its widely-extended area, are reproduced in the colouring of the parasite. The second case is a similar one, that of the mimicry of the colour and marks on the body of another wasp, *Vespa germanica*, by its parasite *Conops diadematus*. In both instances the object gained by the mimicry appears to be easy access to the nests of the wasp, which are vigilantly guarded against intruders by sentinels, whom the parasite appears to deceive.

At the meeting of the Manchester Statistical Society, held on March 18, Mr. William E. A. Axon, F.S.S., read a paper on the subject of the Relative Proportion of the Sexes. Mr. Axon showed that the two propositions that there were more males than females born, and that the excess is smaller amongst "natural" children than amongst those born in wedlock, were supported by the general testimony of European birth registers, and had been very generally accepted by statisticians. Many ingenious conjectures had been framed to account for the disparity, and one writer (Mr. W. L. Sargant) had thrown doubts upon the reality of the alleged facts, suggesting it as not unlikely that male births, being more carefully regarded, were more carefully registered than female, and that the apparent excess of male births was owing to this cause. This preference did not apply to illegitimates, and hence, he said, the number registered was equal in both sexes. Before this view could be accepted, said Mr. Axon, it was necessary to ascertain the proportion of male to female births in cases where this disturbing influence was not operative. He then gave statistics from Siamese harems, English sovereigns, the royal families of Europe, the English peerage, the Dublin Lying-in Hospital, and St. Mary's Hospital, Manchester, affording in all 25,826 cases, to which the disturbing influence of the supposed better registration of male births did not apply. Of these there were 13,496 males and 12,430 females—a result which confirmed the testimony of the registers, and which, he said, showed that there was a natural law, in obedience to which more males than females entered the world.

MR. ALEXANDER J. ELLIS, F.R.S., has in the press a pamphlet, in which he endeavours to show that ordinary algebra in all its integrity, including incommensurables, negatives, and imaginaries, is merely the calculus of similar triangles upon one plane. The consequence of this is, that every algebraical expression whatever, represents and is represented by a point in a plane. As a further consequence, the relation between independent and dependent variables in functions becomes merely a relation between corresponding points in a plane. Developing this notion, Mr. Ellis shows that the whole of the algebraical geometries of Descartes and Pluecker, as well as the homographic geometry of Chasles (hitherto thought to be entirely distinct from the others), can be brought under one set of equations, and treated from the same point of view, which brings the so-called "imaginary" cases under the same conception as the "real" ones, and gives them an equally explicit geometrical meaning. Curiously enough, although the old algebraical symbols are employed with their old laws of combination, leaving nothing for algebraists to learn in the shape of work, the new geometrical

meaning infused into them greatly simplifies, at the same time as it generalises, all calculations, and especially facilitates all questions of direction. In Mr. Ellis's pamphlet, which will be called *Algebra identified with Geometry*, sufficient details are given to enable all mathematicians to work the theory for themselves. Mr. Ellis gave an oral exposition of the principle before the Mathematical Society on Thursday last, April 9.

HANSEN, the distinguished astronomer, died on March 28, at Gotha, after a short illness, at the age of 73.

THE *Allgemeine Zeitung* speaks in highly commendatory terms of Mr. Wallace's translation of Hegel's *Logic*, which was reviewed in the ACADEMY, No. 88, p. 38. The writer compliments Young England on the success with which it is turning its energies to the task of mastering the profounder departments of knowledge, and giving proof of the freshness and vigour with which the present alumni of the ancient English Universities are grappling with the most difficult questions of the schools.

DR. HAIGH has lately reprinted some very interesting "Notes in illustration of the Runic Monuments of Kent," from the *Archæologia Cantiana*. They are accompanied by a considerable number of excellent illustrations, and may fairly be said to exhaust the subject. The author shows that different tribes and localities had different *futhorcs* or systems of runic characters, and the attempt to read inscriptions belonging to one by a *futhorc* belonging to another is as incorrect as to decipher a Korinthian inscription with no alphabet but the Attic. He believes, however, that all the *futhorcs* go back to one original, which was a common pre-Christian heritage of the Teutonic family, and not confined to the Scandinavian branch alone. Indeed, one main object of the present work is to prove that the Goths possessed a special *futhorc* of their own, at an early date, which they brought with them to Denmark and Scandinavia in the fourth century, when they invaded those countries in conjunction with the Jutes or Jotungi, and to Britain in the fifth century, when they overran the south-eastern shores of this island, again in conjunction with the Jutes. The original home of the latter people was in the modern Prussia and Livonia, whence they scattered themselves in all directions, settling as Swenes in Swabia and as Jutes in Jutland, where they remained till driven out in the seventh century by a race which ushered in the so-called later iron age. An appendix raises a curious and interesting question. A horn has been found in Denmark, inscribed with runes and cased with gold and silver, which bears two lines of zoomorphic writing, that is, writing in which the characters are formed by the representation of men, snakes, and other animals. A silver cup, also found in Denmark, is ornamented in the same way. Dr. Haigh thinks that this zoomorphic writing conceals the letters of the Glagolitic or Old Slavonic alphabet, and we thus have monuments of the prehistoric period in Denmark playing, as it were, with writing, like the illuminated MSS. of the Longobards in Italy, and the Visigoths in Spain in the seventh and eighth centuries, or the Armenian MSS. of a later day, and bearing witness to an intercourse between the Teutonic races of the north and the Slaves of the south, as well as to the existence of an alphabet among the latter people before the introduction of Christianity.

THE distinguished Orientalist, Professor Marcus Joseph Müller, died at Munich, on March 28, at the age of sixty-five. Professor Müller, whose later years were clouded by great physical suffering, owed the seeds of his malady to the injury which his health sustained from long-continued exposure to cold, when, in prosecuting his examination of Arabic MSS. in the Escorial, he was forced, by the discourtesy of the attendants, to sit for hours together daily in damp and draughty corridors.

WE have just received the third *fasciculus* of Professor Grassmann's *Wörterbuch zum Rig Veda*. It goes as far as *pra*, so that about one-half of the work is now finished. It reflects the greatest credit on the compiler. It is both more complete and more correct than the Vedic portion in the *Sanskrit Dictionary* published by Boehlingk and Roth, a fact which reflects credit on Professor Grassmann without in the least detracting from the credit due to the authors of the larger Dictionary, which was commenced in 1852, during the infancy of Vedic studies, and will be finished, we hope, in about a year or two. On one point, however, Professor Grassmann has committed a serious mistake in not following the example of his predecessors. Instead of quoting according to book, hymn, and verse, he has numbered all the hymns consecutively from beginning to end. We doubt whether he has gained much, if anything, by that plan. After the 100th hymn he has always three, after the thousandth four numbers. Instead of II. 1. 1, he has 192. 1; instead of II. 10. 1, 201. 1. The last hymn with him is 1,071. 1; according to the other system, X. 191. 1; so that the gain is very small. The loss, on the other hand, is most serious. Nearly all scholars have for years adopted the other system, and have now to translate each reference in Professor Grassmann's book, before they can use it. And while with the old system they knew at once that a passage was taken from the first book, from the book of the Visvāmitras, the Vasishthas, from the ninth or Soma book, or from the tenth, each of them having a character of its own, all this is lost with Professor Grassmann's way of counting the hymns. However, the *trop tard* applies to this as to many other things which seem trifling in themselves, and yet mar considerably the practical usefulness of many literary undertakings.

MR. BURNELL has lately made a curious discovery in reading the oldest Tamil Grammar, the *Tolkāppiyam*. That grammar is composed on the model of the Indra Grammar. The preface, which is of the same date as the text, expressly states this fact. The peculiar terms common to the *Kātantra*, *Kakāiyana*, and the *Prātisākhya*s occur (mostly translated into Tamil) in this work, so that all these works would seem to belong to the Aindra School of Grammar.

ON page 385 of Professor Max Müller's *Science of Religion*, he remarks the curious coincidence between African and Indian beliefs as regards the hare in the moon. It is now stated that this arises out of the appearance presented by the full moon in the tropics, when the inequalities present a form so like a hare that it is impossible for different nations not to have noticed it.

MEETINGS OF SOCIETIES.

NEW SHAKESPEARE SOCIETY (*Second Meeting: Friday, March 27*).

MR. FLEAY's paper was read, "On the Application of Metrical Tests to determine the Authorship and Chronological Succession of Dramatic Writings. Part II. Fletcher, Beaumont, Massinger." The special results aimed at were—1. The determination of the plays written by Fletcher alone; 2. Those written by Fletcher in conjunction with Beaumont; 3. Those written by Fletcher along with Massinger, Middleton, Rowley and others. Immediately dependent on these results was the determination of the chronological succession of the plays.

After giving elaborate tables of the metrical peculiarities of each play, Mr. Fleay stated that the following tests were invariably to be relied on for these authors.

1. *Fletcher*.—More double endings than any known writer; no prose; flowing stopt-lines.

2. *Massinger*.—Many double endings, ranking next Fletcher in this respect, but distinctly separate from him; no prose; unstopt lines often ending with but, of, am, etc.

3. *Beaumont*.—Few double endings; prose; smooth verse; far more rhyme than Fletcher or Massinger.

He then gave a list of the plays he assigned to Fletcher alone, in all of which he agreed with Dyce, who, in fact, has done all that external evidence will enable one to do.

He next gave a list of the plays known to be written by Massinger alone, in which also he agreed with Dyce in excepting the play called *A Very Woman*.

He then gave metrical tables of the plays contained in those two classes, pointed out the differences between them, and showed that in eight plays there were some verses agreeing in all respects with the Fletcher plays, and other scenes agreeing in all respects with the Massinger plays. He therefore assigned them to the joint authorship of these two writers. The plays were: *The Little French Lawyer*, *The False One*, *The Prophetess*, *The Spanish Curate*, *The Beggars' Bush*, *The Elder Brother*, *The Lover's Progress*, and *A Very Woman*. This is considered by Mr. Fleay as the most important practical inference from his paper, and as the most valuable evidence of the truth of his system of testing. He showed also that external evidences—the lines of Sir Aston Cockayne, for example, and the absence of entries in the book of the Master of the Revels—confirmed his conclusion. This part of the paper was new in result for five of the plays concerned, and in method for all.

He then discussed the plays in which other authors had worked with or on Fletcher. The results in this part are of less interest and the plays inferior; we dismiss them with the observation that Mr. Dyce's instinct and Mr. Fleay's investigations seem to lead to like results, except that Mr. Dyce thinks much more highly of Rowley than Mr. Fleay does, and sees his work when Middleton's is perhaps more likely.

In the final group of plays—that is, final in order of treatment, earliest in date—Mr. Fleay is positive that he recognises the work of Beaumont in three plays assigned by Dyce to Fletcher only, viz., *The Woman Hater*, *The Captain*, and *The Knight of Malta*; he thinks also that *Love's Cure* is partly by Beaumont, certainly not entirely by Fletcher. On tabulating this group he noticed the curious fact that Fletcher's work increased, and Beaumont's share diminished, with the progress of time for all the plays whose dates are certainly known: he therefore proposed as a tentative arrangement to place all the plays in this group on the same principle.

LINNEAN SOCIETY (*Thursday, April 2*).

MR. W. KITCHEN PARKER, F.R.S., read a paper, in which, following the morphological classification of Professor Huxley, as distinguished from that of ornithologists proper, he showed that an examination of the palatal structure of the Woodpeckers proves them to be allied to the *Passerinae* (the embryos rather than the adults); that, while most of the non-passerine birds that seem to come nearest to the Woodpeckers, have a very solid palate, the Woodpeckers retain that non-coalesced condition of the palatal structures which we see in the Lizards; and an unusually arrested condition of the palatal part of the upper jaw-bone, and bones superadded to the palate, which are distinctly Lacertian characteristics. Mr. Parker therefore proposed to introduce for the Woodpecker tribe the morphological term *Saurognathae*.

ENTOMOLOGICAL SOCIETY (*Monday, April 6*).

SIR SIDNEY SMITH SAUNDERS, President, in the Chair.—Mr. Frederick Smith made some interesting observations relative to the habits of the bee-parasites belonging to the genus *Stylops*. Major Parry communicated a paper entitled "Further Descriptions of Lucanoid Coleoptera;" and Mr. Smith read "Descriptions of the *Teuthredinidae*

and *Ichneumonidae* of Japan, from the collections of Mr. George Lewis." Further notes were read from Mr. Gooch, of Natal, respecting the destruction of the coffee plantations there by longicorn beetles.

SOCIETY OF BIBLICAL ARCHAEOLOGY (*Tuesday, April 7*).

DR. BIRCH, F.S.A., President, in the Chair. The following papers were read:—1. "On Four Songs contained in an Egyptian Papyrus in the British Museum." Translated, with notes, by C. W. Goodwin, M.A.—Of these four songs three partook of the same nature, and were amatory compositions, written in a highly imaginative and poetical style with much voluptuousness of expression, having a very striking resemblance, extending throughout whole passages, to the language of the Canticles. Structurally the verses possess both rhythm and alliterative construction, with regular pauses or strophes. The first song is unfortunately in a very fragmentary condition, and is besides imperfect at the beginning and the end. In the second song these marked parallelisms occur, "The beginning of the song of joy and beauty of thy sister beloved of thy heart." "Come to the meadows, my brother beloved of my heart;" "Sister, one of the lilies;" and further on, "The voice of the swallow resounds, it saith the earth is enlightened;" "Let thy hand be in my hand when I go to walk, let me be with thee in every pleasant place;" "Thou lovest me running to seek me." Nearly similar passages occur in the third song, which is also a fragment. The fourth song or hymn is of a very different nature, and is evidently one of the solemn dirges used at festivals during the exhibition of the figures of Osiris, as related by Herodotus. This Hymn is in the text ascribed to King Antuf, a monarch of the eleventh dynasty. The ancient relic is fortunately almost perfect, and the composition is of a high order, as the following extract will testify:—

"Put oils upon thy head, clothe thyself with fine linen adorned with precious metals, with the gifts of God. Multiply thy good things, yield to thy desire, fulfil thy desire with thy good things, whilst thou art upon earth, according to the dictation of thy heart. The day will come to thee when one hears not the voice, when the one who is at rest hears not the voices of the mourners" . . . "yea, behold none who goes thither returns back again."

2. "Nimrod et les Ecritures Cunéiformes." Par Joseph Grival (read in English).—In this essay the author maintained that Merodach, under his Accadian name of "Amarud the eldest son of the Lord of Urhi" was identical with Nimrod the "géant chasseur" of the Septuagint.

LONDON ANTHROPOLOGICAL SOCIETY (*Tuesday April 7th*).

DR. CHARNOCK, F.S.A., President, in the Chair.—The papers were: 1. "On the Pre-Historic Antiquities of the Caucasus," by Dr. Isidore Kopenicki. The paper related to ancient caverns, lacustrine habitations, megalithic monuments, and Iberian sepulchres. 2. "On the Roumanian Gipsies," by Dr. Charnock, F.S.A., President Anthropological Society. By the census of 1860 the Roumanian gipsies are put down at 300,000. They are well-formed and long-lived. There are, however, many cripples from artificial causes. They are adroit in work, but work very little, and pass whole days in sleep. They are fond of carrion, and are great cowards. Chastity is scarcely known. Their ordinary diet is a polenta of maize called *mămlăgia*. Men, women, and children smoke from the age of five. The native dance is the *tănana*. Most of the gipsies have fixed residences. The Vatrassi class are all well built, have beautiful black eyes and long black hair. On becoming mothers the women are very ugly. They have entirely forgotten their native language, and have lost the manners and usages of gipsies. The best musicians are found amongst

them. Some are engaged in agriculture, and they are more civilised than the Roumanian peasants. The paper concluded with full remarks on the grammar, and a comparative vocabulary of the Roumanian gipsy dialect with other gipsy dialects, and with the Indian languages. 3. "On the Gypsy Dialect called 'Sim,'" by the President. The dialect in question is spoken by Egyptian gipsies in the presence of strangers, and for secrecy. The author traces most of the words to the Arabic, concealed by prefixes or suffixes, and sometimes by both. The Egyptian suffix *ish* (under various forms) is found in a great many words. Other suffixes are *mi*, *ma*; and *ah*, *eh*, are used as prefixes. The paper contained many examples, including numerals. The word Sim is probably from *el-simiyā*, for *el-kimiyā*, secrecy.

FINE ART.

Hogarth's Works: with Life and Anecdotal Descriptions of his Pictures. By John Ireland and John Nichols. The whole of the Plates reduced infac-simile of the originals. In Three Series. Three Volumes. (Chatto & Windus.)

WILLIAM HOGARTH is one of the figures in history—in art-history at least—whose importance increases with time. This is the case with so very few men in the annals of literature and the arts, that we in England may consider the possession of this one man of true native blood and cosmopolitan importance as equivalent to that of a hundred of the rank and file of talent—to the whole Bolognese-school perhaps, or to the entire French painters down to the time of Watteau. This is, of course, a mere short-hand and hypothetical estimate; but if we consider that the modern point of view in painting is derived from his practice—that dramatic interest in the action represented, and individuality in the characters, were first asserted, with the genius that justified them for ever, on the canvas and copperplates of Hogarth, we shall see that it is very difficult to overestimate his importance; whereas (to return to our comparison) the whole Bolognese practice was only a studio eclecticism, delaying, not averting, the demise of Italian painting; and all the professors and respectabilities of the old French school were collectively little better than a decorated millstone round the national neck. Yet from his own day, when he had repeatedly to assert his right to be considered a painter at all, to the last generation, when De la Roche refused to admit him to the Assembly of Artists on the walls of the Ecole des Beaux-Arts, he has been ignored by many writers. And this for the very simple reason that he held the technical beauties of his art—the beauties of colour, chiaroscuro, and composition (which were indeed the only beauties recognised in his day, and then found exclusively in the works of the old masters)—were not the ends but the means of art, and that the Beautiful itself was only one of the objects a painter should place before himself.

The great result in the development of art effected by Hogarth is the utter effacement of generalisation in character, which has now at last taken hold, not only of *genre* but of history. Perhaps this would have come about although he had never existed; but even with his example the struggle was long and the victory a doubtful gain for

two generations. Watteau's faces were all the same, and so were those of the contemptible creature Greuse, who could not sentimentalise without a *double-entendre*. After these painters came the full tide of the classic; and on the decline of that, the earlier opponents of David and his pupils were still very uncertain how far they should go in exact study of archaeology and of the model. In this country, although we had no full-blown classicism on canvas, the fight against individuality was maintained, first by our Italian visitors, Kauffmann, Cipriani, and others; and then by all the band of men by whom the Boydell gallery was furnished, and books illustrated, at the end of last century and beginning of this. Where now are all these historic and Shakespearian pictures by Opie, Northcote, Fuseli, and others, it is impossible to say; while every design, great or little, by Hogarth is reproduced again and again.

Hogarth's own practice was no doubt partly determined by his education, or rather want of it, as he adopted painting without a master and without training. But the great distinction of dramatic truth and precision of thought belonged to him by birthright, and had descended to him from his grandfather, who wrote and constructed a kind of miracle-plays performed by the peasantry in his native place in Cumberland. In the painter's most ambitious works—his great Biblical subjects, *Paul before Festus*, in Lincoln's Inn hall, and *The Child Moses brought before Pharaoh's Daughter*—we find an attempt to generalise and to elevate his style into the serene but vapid atmosphere of Sir J. Thornhill or the imitators of Poussin, but with very little effect. Indeed, in spite of that attempt, in these very works we find flashes of vitality and original poetic instinct, as in the introduction of a young crocodile peeping from under the chair of Pharaoh's daughter, or in the remarkably fine figure of the public orator, or counsel for the Crown, as he may be called, in the *Paul before Festus*. It is curious and interesting, in a critical point of view, to find that these very portions of the pictures were those which brought down condemnation on the painter even from the generally eulogistic pens of Ireland and Nichols. "A crocodile creeping from under the stately chair may be intended to mark the neighbourhood of the Nile, but it is a poor and forced conceit," it is said; and of the orator the same able editor finds himself forced to speak even more severely: "The Herculean advocate, with a brief in his right hand, looks like a journeyman hatter that has drunk beer till he is drowsy; by the strength of his muscles and the stupidity of his countenance he seems better fitted for a bruiser than for a pleader." And yet the face in question is exactly such a face as a Pagan counsel would turn upon an enthusiast and a Christian, of whose peculiar doctrines he knew nothing but that they were becoming, in his opinion, a public nuisance.

To estimate the influence of Hogarth's originality properly, we must also bear in mind that *genre*, that wide and ever widening field in painting, had then scarcely any existence; the Dutch school of still-life and "conversation pieces" was extinct, and in

England such a class or section of painting had not yet been thought of. He had no choice, on adopting painting as a profession, between the great historical style which he essayed in the Bible subjects just mentioned, "to serve as specimens to show that were there an inclination in England for encouraging such pictures, these first essays might prove them more attainable than is generally imagined," and portraiture. This last was of course the popular and remunerative work, and had its attractions to Hogarth, but his proficiency in both arts of painting and engraving suggested to him the altogether novel plan of addressing the public at large through design. Perhaps it is not too much to say that no historical subject or large engraving of any popular kind had as yet been published in this country, so that here again we find him occupying an entirely new position, and one that it immediately became necessary to protect by a Law of Copyright. This novel plan of "painting and engraving modern moral subjects, not hitherto tried in any age or country," is defined by himself very clearly:—

"The reason which induced me to adopt this mode of designing was, that both writers and painters had, in the historical style, totally overlooked that intermediate species of subjects which may be placed between the sublime and the grotesque. I therefore wished to compose pictures on canvas similar to representations on the stage, and I further hope that they will be tried by the same test, and criticised by the same criterion. Ocular demonstration will carry more conviction to the mind of a man than all he will find in a thousand volumes; and this has been attempted in the prints I have composed. Let the decision be left to every unprejudiced eye; let the figures in either pictures or prints be considered as players dressed either for the sublime [tragic?] genteel comedy or farce, for high or low life. I have endeavoured to treat my subjects as a dramatic writer: my picture is my stage, and men and women my players, who, by means of certain actions and gestures, are to exhibit their histories and passions."

From that day to this, not only the subjects and scenes drawn from contemporary life, but even illustrations of history, and at last even those of the Bible, have condescended to the criterion here indicated; and the old motive and higher poetic endeavour of realising the *idea*, the abstract or the conventional, are gradually fading out of existence.

In attributing to Hogarth this importance in assisting the change that has come about of late years, the writer must add that he does so without expressing any opinion as to the good or the bad, aesthetically speaking, of the limitation and definitive study now imperative.

These remarks on Hogarth's importance in the modern development of the art have led us away from the book suggesting them. A few sentences regarding it must suffice. These three small octavo volumes contain the most complete edition yet published, in a literary point of view, of the great innovator's labours. All his own writings—that is to say, his *A. Book of Beauty*, and his autobiographic and other papers—are given, with the whole of the ample "Anecdotal Descriptions" of both Nichols and Ireland.

The illustrations themselves are nearly a hundred and seventy, a much larger number than could be reproduced at a reasonable cost by any but mechanical means. These comprehend, not only the important picture-stories of the vices of society and the follies of the age, but all his illustrations to *Hudibras* and *Don Quixote*, and many of his juvenile prints, in themselves worthless, but interesting as being from his hand. Indeed some of the *Don Quixote* series were not worth reproducing, only the publishers seem to have determined to make their book complete. Of the quality of these prints it is not so easy to speak. They are reproduced on the small scale necessary for the volumes by some one of the many adaptations of photography, and printed apparently from lithographic transfers. The result is not always a success: the lines of the original engravings being rendered infinitely closer by reduction in size, the effect is unhappily black and heavy in some specimens; in others it is all that can be wished. These are, however, the less elaborate subjects. In all cases, however, they are, as the publishers say, "fac-simile;" they have gone through no second artistic hands, but, as far as they go, give us the veritable expression of the master.

WILLIAM B. SCOTT.

M. BEULÉ.

ARCHAEOLOGICAL science has sustained a serious loss in the sudden death of M. Charles-Ernest Beulé, sometime Professor of Archaeology at the Bibliothèque Impériale, and Perpetual Secretary of the French Academy of Fine Arts. M. Beulé was born at Saumur in 1826, was a brilliant pupil of the Ecole Normale, and after a first appointment as professor of rhetoric at Moulins, was sent to the Ecole d'Athènes, an institution to which England provides no parallel, and the utility of which the career of M. Beulé did much to re-assert in the face of some gainsayers in France. The most important work in which M. Beulé took part at Athens was the exploration of the Propylæa. By his share in these investigations, and by his contributions to the literature of archaeology, M. Beulé had already acquired a high reputation when he returned to France in 1853. The next year saw him elected to succeed Raoul Rochette in the chair of the Bibliothèque; in this year also he published his treatise on the Pediments of the Parthenon, and the first edition of the book—the *Acropole d'Athènes*—by which he has continued to be most widely known. In the succeeding years, in addition to his professorial work, he continued his contributions to the special literature of his subject; in 1860 he was elected a member of the Academy of Inscriptions, and in 1862 Perpetual Secretary of the Academy of Fine Arts. The two years following this appointment produced from his hand obituary memoirs of Horace Vernet and Hippolyte Flandrin, as well as the reprint in a book form—*L'Art Grec avant Périclès*—of a series of articles contributed to the *Gazette des Beaux-Arts*, and of a drama of *Phidias*, which appeared originally in the *Revue des Deux Mondes*. His principal labours from this date to the war of 1870 consisted in explorations on the site of Carthage, and in the completion and publication, in the four volumes entitled *Processus des Césars*, of his lectures on the family of Augustus. This was a work of malice as well as of research, and by its studied innuendoes against another Imperialism than that of Augustus, filled in Orleanist circles the place of a more learned and refined *Lutetia*. It was a curious revenge of fate by which the satirist stood before the world, in the councils of the coalition of last May, to administer the depart-

ment of the Interior, without perceptible reluctance, through the agents of the Empire, on principles more imperial than its own. But for this unlucky episode, M. Beulé would have furnished a blameless as well as eminent example of a class in which France is peculiarly rich, the class of writers and teachers who, by vivid style and intelligent exposition, bring the results of science within the circle of general culture. His second-hand compilation is admirable in its way; and his researches, both at Athens and Carthage, had importance enough to earn him no unjust reputation for original as well as for second-hand work.

THE COLLECTION OF LACE AT THE INTERNATIONAL EXHIBITION.

THE collection of lace is the great centre of attraction in this year's International Exhibition. Never was there such an assemblage of priceless specimens brought together, many of them preserved as heirlooms in the families of their present possessors. Every class of lace is here represented. Of the early "fillet" or darned netting, there is a magnificent example in an altar frontal, fifteen feet long, representing scenes in the Passion; while curious altar-cloths and cushion covers of cutwork, trimmed with point, are fine specimens of the rich Italian lace of geometric pattern of the sixteenth and seventeenth centuries. Of the products of Venice, the great artistic lace centre of Southern Europe, the finest examples of every variety are exhibited. The bolder rose point, which looks as if sculptured in marble, and the fine Point de Venise in relief, where each tiny flower is superposed on the other, with all the grace and delicacy of Italian art, are alike well represented in numerous flouncers, which more probably were originally destined for the trimming of sacerdotal albs. One alb so adorned with fine Venetian point round the skirt and with cuffs to match is here shown.

A coverlet two and a half yards square, said to have been the property of Louis XIV., is perhaps the finest and largest known specimen of the rose point or "gros point de Venise," as it is sometimes called.

There are many fine examples (deep flouncers) of the rare and costly Point d'Argentan—twin sister of Point d'Alençon, and both offsprings of Venice; but Argentan retains more strongly than Alençon the traditions of the source whence she sprang, and the patterns are of bolder character than those of Alençon.

The pillow-made laces of Northern Europe, of which the Netherlands were the centre of production, are here in great variety. A magnificent specimen of the old Brussels, or Point d'Angleterre, once belonged to Marie Antoinette.

The collection of modern lace is very splendid. Brussels and Alençon in great abundance, while Valenciennes, Honiton, Irish and Maltese, close the catalogue.

Beautiful as this collection is, it has a more important benefit than the mere exhibition of what is rich and rare. It affords the opportunity of comparing the old lace with the new, and of showing how much the manufacture has deteriorated in design. Compare the crowded, loaded patterns of modern Brussels, Alençon, or (worse still) of Honiton, with the easy, graceful, simple elegance of the old Venetian, Argentan, or Brussels, and it is obvious how much we have yet to learn before we arrive at the perfection of former times, and how necessary it is that schools of design should be established in every centre of the lace industry.

ART SALES.

THE following pictures, forming part of the collection of the late Mr. Craven, of Clapham Park and Tenby, were sold on Friday, Saturday, and Monday week by Messrs. Christie, Manson & Woods:—*T. S. Cooper, R.A., Out of the Sun, 2111;*

Milking Time, 1891.; *The Coming Storm*, 4201. J. Linnell, Sen., *Woodcutters*, 1061.; *Over the Hill*, 8711. B. W. Leader, *On the Welsh Border*, 1571.; *A Welsh Birchwood*, 2621.; *A Wooded Welsh River*, 2571. E. Gill, *A Storm on the Coast*, 1531.; *The Falls of the Clyde*, 2311. T. Creswick, R.A., and T. S. Cooper, R.A., *A Landscape with a Flock of Sheep*, 4201. F. W. Hulme, *A Lane in Surrey*, 2001. F. Goodall, R.A., *A Fête Champêtre*, 1941. E. M. Ward, R.A., *Amy Robsart and the Earl of Leicester*, 1891. C. Stanfield, R.A., *French Troops fording the Magra*, 1891. Sir John Gilbert, R.A., *Interior of Rembrandt's Studio*, 5251. J. B. Burgess, *The First Faint*, 2731. W. Duffield, *Still Life*, the artist's last work, left unfinished, and completed by M. Giroud, 1101. L. Perrault, *The Refugees*, 2101.; *The Sisters*, 1101.; *Virtue, Innocence, and Purity*, 2311.; *Maiden's Prayer*, 2681.; *Forgiveness*, 2411.; *Bo-Peep*, 3151.; *A la Bretagne*, 1681.; *The Boudoir*, 2151.; *The Baby Brother*, 3151. H. Merle, *Watching the Crab*, 2011.; *The Mendicant during the Siege of Paris*, 5771. Escosura, *Interior, with Ladies, Sportsmen, and Dogs*, 1471. Madrazo, *The Naturalist*, 1941.; *Coming out of Church*, 1571. Verboeckhoven, *Going to Market*, 2001. Ch. Landell, *Ruth*, 1251. H. Schlessinger, *Sunny Thoughts*, 1151.; *Spring Time*, 1201. H. J. Scholton, *The Last Moments of Lady Jane Grey*, 1411. J. Coomans, *A Pompeian Interior*, 1781. Ch. Weber, *A Shipwreck*, 1311.

At the recent sale in Paris of the collection of M. Stanislas Baron, the most important items were:—*Chevaux à l'abreuvoir*, 35,000 fr., *La Campagne le matin*, Chintreuil, 5,500 fr.; *Bords de la Mi-Donze*, Corot, 3,100 fr.; *Intérieur d'un Harem Marocain*, 3,900 fr., and *Caverne sur les Côtes du Finistère*, 6,600 fr., both by Henri Regnault.

At a sale at the Hôtel Drouot of forty-seven paintings of the modern school, the property of M. Strausberg, the following prices were obtained:—Oswald Achenbach, *Views of Naples in a Storm*, 9,700 fr.; Brascassas, *Bull threatening a Dog*, 19,500 fr.; Daubigny, *Banks of the Oise, Morning*, 3,400 fr.; *The Same, Evening*, 2,980 fr.; Dupré, *Jules, The Fisherman*, 13,000 fr.; Fromentin, *Halt of a Caravan*, 11,000 fr., *Banks of the Nile*, 9,000 fr., *Arab Women*, 8,950 fr., *Arabs at a Fountain*, 8,900 fr.; Gallait, *Happiness*, 9,000 fr., *Misery*, 25,000 fr.; Gérôme, *Interior of a Gynaecitis*, 18,000 fr.; *Shepherd of the Campagna*, 6,750 fr.; Isabey, *Interior of a Church*, 6,200 fr.; Koekkoek, *Interior of a Wood*, 27,100 fr.; Leys, *The Family of Gutenberg*, 18,700 fr.; Marillat, *Mosque in Lower Egypt*, 20,000 fr.; Théodore Rousseau, *Landscape*, 20,800 fr.; Troyon, *Environs of Honfleur*, 20,000 fr. The sale produced 467,950 fr.

NOTES AND NEWS.

In the last excavations at Pompeii there has been discovered near the Porta Stabiana, a house, in a room of which there is a curious mosaic, evidently symbolical, the meaning of which it is difficult to understand. This mosaic is about twenty inches square, and in the middle is depicted a skull, upon which is a mason's level with line and plummet. Beneath the skull is a very large butterfly with outspread wings, and below the butterfly a wheel similar to that on which the goddess Fortuna is represented. On the right, facing the mosaic, is a staff, and near it a traveller's bag, and on the left a net. This mosaic, which is in excellent preservation, has been transferred to the Museum, and placed in the Mosaic room.

A SOCIETY has been formed at Munich for the purpose of erecting a memorial to Professor von Schwind, which it is intended should take the form of a grotto temple decorated with frescoes after the master's own works.

It is satisfactory to find (*Levant Herald*, March

24) that the Austrian government, having last year sent Professors Conze and Niemann to explore the archaeological remains of the island of Samothrace, now intends to organise a second expedition for the same purpose. Whether Professor Conze will accompany the new expedition is not stated, but even if he should not, it is quite apparent that the undertaking has been arranged at his suggestion, and will be chiefly directed by him. The examples of early Greek art already obtained in Samothrace, the connection of that island with the early religion of Greece, for example, with the worship of the Cabiri, and lastly the familiar knowledge of Samothrace possessed by Professor Conze, raise hopes of valuable discoveries.

GENERAL LUIGI PALMA DA CESNOLA, U.S. Consul at Larnaka, has favoured us with a sight of some photographs from what must at present be accounted the most interesting of all his archaeological discoveries in the island of Cyprus. This is an archaic sarcophagus in the calcareous stone of the island, recently excavated in the necropolis of Golgoi. The monument appears to be in an almost complete state; it has a ridged cover, at the four corners of which appear crouching lions boldly carved in the round. The four walls of the sarcophagus carry sculptures in low relief. At one end is the figure of a chief driven in a quadriga; this may probably be a representation of the personage buried in the monument; he wears a beard, while the *ἡνίοχος* beside him is beardless; both of them wear peaked caps. At the other end is a mythological representation of Perseus and the Gorgon. Perseus, similarly bearded and wearing the peaked cap, walks off with the *κρίνον*, enclosing the head of Medusa, slung from a stick which he carries over his left shoulder, and holding in his right hand the *ἀσπίς* or instrument of decapitation. The Gorgon is represented with four wings; she kneels on one knee, and has her hands uplifted to hold with one hand Chrysaor, and with the other the horse Pegasus, who are in the act of springing together from her severed trunk, an unusual representation, illustrating, as it were literally, the text of Hesiod (*Theog.* 280). Between the figures of Gorgon and Perseus there is a seated dog. Of the lateral representations, one is a hunting-scene and the other a symposium. Of the five huntsmen in the hunting-frieze, four are armed with the Greek helmet and tunic, and carry spears and round bucklers; the fifth wears a peaked cap, and carries a bow and arrow. The animals appear to be a horse, a bull, a cock, a boar, and an antelope. The banquet-frieze, with a tree and a large amphora at one extremity, exhibits a row of four couches, on three of which a man reclines with a woman seated beside him, while upon the fourth a bearded man alone holds out his cup to a youthful *οἰνοχόος*. Besides the three seated women, one of whom plays upon a lyre, a fourth, standing erect, blows upon the double flute. The whole of these sculptures, while still showing traces of Asiatic and Egyptian influences, and in several points analogous to primitive Etruscan art, are distinguished by a Hellenic feeling for design, and by great elegance of composition. At either end of the monument General Cesnola found a *stèle* of remarkable design—viz., a low, tapering pedestal terminating in bold Ionic volutes, and above the volutes a heart-shaped member carved in relief, with the figures of two sphinxes face to face surrounded by vegetable forms resembling those of Egyptian design; the whole surmounted by an abacus in three members. General Cesnola reports that the faces of the sphinxes on one of these objects are female, and on the other male, and supposes that they were placed erect in front of the sarcophagus in the same way as the Turks set mortuary stones in front of their tombs. General Cesnola further informs us that he intends this year to prosecute excavations chiefly at Famagusta (Salamis) before commencing operations on the site of Paphos.

A CORRESPONDENT writes from Assisi, that the

churches of San Francesco will very soon be restored to their original state. The old choir stalls and wood work, removed from the upper church to one of the halls of the monastery, make a capital display where they are, whilst they no longer disfigure the building of which they altered the character. The papal throne at the bottom of the choir is restored to its old importance by being flanked with stalls in the same style of sculpture painted to imitate marble; and the balustrade and canopy which at some unknown period were placed round the altar of the lower church are removed to the same position in the upper church, which being larger and higher, requires that species of decoration. The wooden transour which spanned the opening of the nave at its junction with the transept is about to be restored, together with a model of the cross which Giunta Pisano once placed there. The two great altars in the transepts having been removed, we now see for the first time, in the southern the whole of the Crucifixion of Giunta Pisano, in the northern a Crucifixion, the execution of which seems also to have been entrusted to Giunta. An addition to Cimabue's frescoes in the transept has also been made by the removal of the choir lofts.

In the lower church or crypt the nave will be separated from the transept as of old, by an iron grating with practicable doors. The singing lofts have been removed, displaying on one side portions of Giotto's frescoes which had long been concealed, ex. gr. the Miracle of the Child of the Spini family, and St. Francis receiving the Stigmata by Lorenzetti on the other. The removal of the balustrade and canopy from the high altar gives light and air to the crypt. The choir remains unaltered; the date of its erection in its present form is found to have been 1471. A stone altar in front of Lorenzetti's Crucifixion and a similar obstruction in front of Cimabue's Madonna, had long been eyesores: these have been taken away and several figures have thus been added to each of these remarkable compositions. Beneath the throne of Cimabue's Virgin, a row of saints apparently executed by Tiberio d'Assisi was brought to light. Most interesting discoveries were made in the chapel of the Sacrament, originally painted for Cardinal Orsini by Giotto. Here the disruption of a marble altar led to the finding of a noble monument—a tomb of marble with the figure of Orsini lying in state attended by two angels; on the wall behind the figure a fresco by Giotto in capital preservation, representing the Virgin and Child between St. Francis and St. Nicholas. Of equal importance was the removal of the altar in the chapel of S. Giovanni in the left transept, resulting in the discovery of a Virgin and Child between St. Francis and St. John the Baptist, a fresco as clean and well preserved as if it had been painted but yesterday by its author, Pietro Lorenzetti.

De Vlaamsche School is the title of a new Flemish illustrated paper of which we have received the first two numbers. Its illustrations are not remarkable as works of art. It contains stories as well as news.

THE Bookbinding department of the International Exhibition is enriched by choice specimens of ancient bindings from the libraries of the Duke of Devonshire, Marquess of Lothian, Earls Orford and Spencer, Mr. Gibson Craig, and other well-known collectors. The Duke of Buccleuch exhibits a curious Bible, bound in crimson velvet, with the arms embroidered in silver. The Dean of St. Paul's, a MS. book of title-deeds of the time of Henry VII., belonging to the library of St. Paul's Cathedral, bound in velvet, and adorned with silver clasps and bosses, the pendent seals enclosed in silver boxes. Mr. A. W. Franks, among other rare specimens, has two curious Dutch almanacs, closed by silver clasps and pencil cases, one with the arms of Holland in silver; also examples of Persian bindings, brilliant with tulips and other flowers. In the same case

is a quaint old MS. volume, containing stanzas addressed to Queen Catherine de Medicis on the birth of a daughter, by Manetti, her initial double K repeated on the sides of the book. Bindings of the Renaissance have the crescents and other attributes of Diane and Henry II., and one has the initials of Henry IV., with the arms of France and Navarre. In the Modern division, Mr. Bedford has two cases with fine reproductions of French and Italian bindings, "dentelle," and other styles. A copy of Dante furnishes an example of the Italian style, and there is a priceless volume, beautifully bound, Queen Margaret of Scotland's *Meditations*. Mr. Bedford also exhibits books with Indian silk bindings, and porcelain book covers. The exhibition of Mr. Birdsell, of Northampton, is most creditable. A fine specimen, the Pedigree of the Compton Family, has their badge, the fire beacon, and their "beasts," the boar and the dragon, repeated over the whole surface of the side, beautifully worked on the white vellum. Mosaic-work bindings are sent by the Academy of Venice. Bemrose, of Derby, shows the effect of fret-cutting, and has also a prayer-book inlaid with ivory and ebony. Flattich, of Marburg (Austria), shows a curious yellow binding, with black ornaments worked with block stamps, and also flowers indented and painted. Zaehnsdorf has bindings in the Grolier, Maioli, and illuminated styles. Tuckett, binder for the British Museum, shows the leather stained in two colours, which has a beautiful effect. Workmen are placed in the room to exhibit the processes of bookbinding, and impart a practical knowledge of the art.

THE *Kölnische Zeitung* of March 27 publishes a letter from Dr. Déthier, director of the Museum at Constantinople, in which he announces the safe arrival at the Porte of the colossal column of Hercules-Melkarth from Cyprus, which has been temporarily deposited in the St. Irene Museum at Stamboul, where he had had an opportunity of examining it. According to his report the figure measures two metres across from shoulder to shoulder. The head, which is covered with the conventional Assyrio-Persic curled and frizzled wig, bears two thick horns, both of which are more or less injured, and have been broken sharply off. On the top of the head is an opening, into which some object must have been inserted, as Neptune's trident, or a serpent which had hung down the back, perhaps both, as may be seen in the Sardo-Ithoencian idols of the Cagliari collection, all of which bear horns as symbols of divinity or power. Horns and rams' heads are also frequently seen on river gods; and after the great naval victory of Demetrius Poliorcetes (294-283, B.C.) the busts of this prince and of his father, as well as those of Seleucus of Syria and Lysimachus, appear with horns, which were likewise borne on the royal tiara of the Arsacidae. The body of the Cyprian Hercules is completely nude, excepting that a skin is bound round the loins by means of a girdle, which is clasped together by a round long-toothed buckle. This skin is fringed with long, twisted ends of hair, and shows the fore-legs and claws of the animal hanging down. The colossal wrists of the figure are raised to the breast, and hold suspended the body of a lioness, grasping the hind-legs with a firm clasp, while the fore-legs of the animal, which measures three metres from the beginning of the tail to the neck, hang down over the feet of Hercules. The body of the lioness exhibits much artistic skill in the roundness and softness of the form, while the tension of the muscles in the hind-legs is given with great accuracy. Dr. Déthier regrets the loss of the head of the animal, which formed the spout of the fountain, as he believes its preservation might have thrown some light on the nature of the skins which are represented around the head of Hercules on the Alexandrine tetradrachms. These have generally been assumed to be lion-skins, but he thinks there is sufficient resemblance between their manes and the part of the neck still preserved in the animal

of the Cyprus group to warrant the assumption that a lioness, and not a lion, is intended to be symbolised on the Alexandrine coins. The feet of Hercules are disproportionately short when measured by their colossal breadth, and the entire figure—with its curled head and straight, thick beard, its strongly marked face, with broad hooked nose, slightly open mouth showing the teeth, and the swollen veins and contracted muscles of the forehead—has the effect of conveying a general impression of sportiveness, trickery and cunning. Dr. Déthier is of opinion that this mingled character of facetiousness and deceit is a proof that in this figure we have a very ancient type (perhaps 4,000 years old) of what in the later and more cultivated periods of Greek art was developed into a Silenus. At Naples there is a bronze group, in which a Silenus holds up by the hind-legs a lioness, whose head forms the spout of a fountain, and where the wrists present the peculiarity of being encircled by roll-like protruding cuffs. A comparison between the Neapolitan Silenus and the Cyprian Hercules has led Dr. Déthier to hazard the conjecture that these assumed cuffs or wristbands may be only unskilfully-rendered copies of the lines indicating the strongly-marked muscular development of the thick knotted arms, and the protruded outline of the radial and ulnar bones of the fore-arms and wrists. In support of his theory that in this Hercules we may have the primal idea of the Silenus, Dr. Déthier draws attention to the fact that among the primitive races of Cyprus, abnormal ideas underlay their conception of their divinities, as in the case of Venus, whom they represented with a long beard, and sometimes as identical with Hercules. Hence, he thinks we may easily trace the Herakles-Sol, or Baal, as he is personified in the twelve signs of the Zodiac, until at length we arrive at the Hercules of later ages, performing his twelve labours, and fructifying the earth by bringing to her the water which she needs. Under this idea Hercules becomes, like Neptune, the god of fountains, or, as Silenus, pours forth at times the wine of Bacchus, or, what is yet more precious than the juice of the grape in a land parched with the ardour of the sun's rays, the sparkling water from springs and streams.

FOUR etchings in the possession of a M. Amadeo, of Marseilles, are highly spoken of. They are the work of a Franciscan monk, named Leonard Amadeo, who died in 1869, and had devoted almost his whole life to their execution. Two represent sacred subjects; a Virgin and Child, described as worthy of Raphael, being the most important of the four.

A RECENT number of the Trapani *Falce* announced (March 15) that the well-known archaeologist, Dr. Taverio Cavallari, of Palermo, has been fortunate enough to bring to light a temple which once stood within the walls of the ancient Greek city of Selinuntum, on the south coast of Sicily. Dr. Cavallari's attention had long been directed to this classic spot, which had, moreover, found an able investigator in Professor Benndorf, who, in his *Metopen von Selinunt* (Berlin, 1873), has collected all the information that could be brought to bear upon the subject, and it was therefore a matter of congratulation to Italian archaeologists that the means placed at Dr. Cavallari's disposition for the prosecution of Sicilian excavations should have been directed to this point specially. Their expectations have not been disappointed, for, as we now learn, his exertions have been rewarded by the discovery, at a spot lying to the west of the so-called Acropolis, and in the midst of an extended sandy plain, of the east front of a temple, sunk twelve feet below the present level of the ground, and which appears originally to have stood upon a raised platform, approached by steps on all sides. Numerous terra-cotta figures, mostly representations of Apollo, Hera, and other gods and goddesses, have been found in the immediate neighbourhood; and, from the scanty reports which

have reached us of this interesting discovery, we are justified in hoping that further investigations may add something to our present knowledge of Graeco-Sicilian architectural art.

IN the *Gazette des Beaux-Arts* for April we find:—1. An account of some mural paintings, executed by H. Lehmann in his own house in Paris. A collection of photographs has recently been published from this painter's works, by which an excellent idea can be formed of his severe style of decoration. The collection includes his last great work, *Le Droit prime la Force*, executed for the Ecole de Droit, previously mentioned in the ACADEMY.

2. An article on Domenico Ghirlandajo and his frescoes in Santa Maria Novella, by René Ménard. No new information is given concerning this artist, but his position with regard to the art of the fifteenth century is defined, and his frescoes in Santa Maria Novella well described. An etching, by A. Didier, of a *Madonna and Child*, by Ghirlandajo, in a private collection, and several engravings from his frescoes, add to the interest of the article.

3. Edmond Bonnaffé again deals with paradoxes. "La Contrefaçon" is the subject on which he at present dilates. The counterfeiting of ancient works of art is carried on to an unsuspected extent at the present day. "At Rome, pre-Raphaelite pictures are still being painted; Belgium sends forth Van Eycks and Memlings by the dozen; and in Paris," says M. Bonnaffé, "I know a Boucher-manufactory that has made many victims." The fabrications of antique sculpture, carving in wood, ivory, mediaeval jewellery, Venetian glass, and other objects sought for by collectors, must indeed be a considerable branch of industry. Modern chemistry in many cases is called in to effect the work of time. "Le permanganate de potasse teint le bois neuf, l'acide nitrique en dévore l'épiderme et le dessèche, le sulfate de potasse vieillit l'or et oxyde l'argent, le chlorure d'ammoniaque colore le bronze, tandis que le vitriol décolore les étoffes." And not only so, but we are told by M. Bonnaffé's interlocutor (the article is in the form of a dialogue) that he is on the track of a wood carver who possesses an especial instrument for making artificial worm-holes in wood. 4. The Artistic Curiosities of Russia are again described. 5. The Musée de Lille receives a notice from Louis Gonse. 6. George Cattermole receives an appreciative criticism by M. Colas in the first of a series of articles on English Painters in Water-colour. 7. M. H. Revail's magnificent work on Romanesque Architecture in the South of France is reviewed by Alfred Darcel. 8. The Suermondt Collection, which is still being exhibited at Brussels, is noticed by Paul Mantz, and an etching by L. Flameng after Rembrandt, and an engraving from a *Madonna and Child* by Van Eyck are given as examples of its treasures. The *Gazette des Beaux Arts* has given us before a taste of this great collection in the splendid etching by F. Gaillard of Van Eyck's *Homme à Oeillet*. 9. J. Dubouloz reviews Redgrave's *Dictionary of Artists of the English School*, and a spirited etching by Ch. Waltner of Morland's *Two Coachmen* enlivens his text. 10. Apropos of the fire at the Pantechnicon Louis Viardot discourses widely on the destruction of works of art in all ages and places by fire and other agents. The destruction of Michael Angelo's cartoon of *Pisa* is still spoken of by him as if it were certainly the work of Baccio Bandinelli, whereas it is now generally believed that he had nothing to do with this "crime insensé contre l'art."

WE learn from the *Chronique* that M. Héron de Villefosse, an attaché of the Louvre, has been appointed by the Minister of Public Instruction to conduct an archaeological mission in Tunis. His expedition is especially for the purpose of studying the Latin inscriptions that are found in great number in this part of Africa. M. Jules de Laurière accompanies him.

THE STAGE.

"NOS BONS VILLAGEOIS."

Nos Bons Villageois was written by Monsieur Sardou at a time when he was building up the reputation which he is now industriously undermining. It is one of the best examples of his work—bright as well as strong; more therefore of a Vaudeville comedy than of a Gymnase drama; and Messieurs Valnay and Pitron, the managers of the French plays in London, have done exceedingly well to produce it on the occasion of their moving house for the season. Its performance is the beginning, let us hope, of an excellent period for the Princess's Theatre.

Messieurs Valnay and Pitron have also done exceedingly well to enter into an engagement of considerable length with the two French players who have this week made their first appearance in London. The presence here of Monsieur Gouget and of Mademoiselle Kelly adds greatly to the strength of the company; and the only pity is that they, or an actor and actress of equal capacity, were not engaged long before. That would have spared us more than one dull evening, the results of which we have not cared to chronicle in these columns. It is not that the French company has until now been without good players, but that none of the good players have been fit to take the leading parts in the higher comedy. A brisk comic actress has been seen in Mdlle. Dolly, a fair *jeune premier* in M. Bilhaut, and two admirable comic actors in MM. Didier and Schey. But the company has wanted the addition which it has just now received, since in M. Gouget it has for the first time an artist who can play the chief character in a great comedy like *Nos Bons Villageois* with dignity, ease, and reserve; and in Mdlle. Kelly it has an artist who knows something of the resources of her art, and is a really natural and graceful representative of the younger heroines of Sardou, Dumas, and Emile Augier.

By the side of the love story, without which, of course, no serious comedy could be complete—and to which at the Princess's Mdlle. Kelly does justice—there runs in *Nos Bons Villageois* a chronicle of the battle waged between modern progress and rural prejudice in many a country commune of France. Progress is represented by Le Baron (M. Gouget), who is mayor of the commune, in order that the commune may be civilised; and prejudice is represented by a band of villagers—M. Floupin, the druggist; M. Tétillard, the grocer; and a certain M. Grinchu, who regards the village stream as his own special preserve for fishery, and thinks that the fish, which don't like strangers, go into Grinchu's net contentedly, to fulfil a law of their nature. Tétillard adulterates his sugar, and reproves the mayor for destroying local commerce by buying his groceries in Paris. Floupin is a snob, who has got a little education, wishes to play Caesar to the Baron's Pompey, and is good-natured enough to discuss local politics with his inferiors as long as he can persuade them that he, and no other, ought to be their mayor. These three village characters are strongly individualised. They are presented with more of humour than wit. They are handled with much suggestive satire; and M. Sardou is evidently upon the side of the town. That circumstance, and the fact that it is his primary object to amuse us, prevent the work from being a really serious study and comparison of town and country follies; but M. Sardou is not by any means alone among French writers, who have a fondness for raising social questions and leaving other people to settle them. *Nos Bons Villageois* is an entertaining picture of many a country oddity, and at the same time it has in its main love story an interesting theme, treated in a way that is manly and healthy.

THE NEW PIECE AT THE STRAND.

The new piece at the Strand Theatre, entitled *May*, and written by Mr. Reece, who is known as

the author of many a brisk burlesque, would have been better as a work of art if its story could have been told within the compass of two acts. There is not substance enough in it for three; nor is there enough of literary power and charm to make the slightness of the story seem of small account. We should be sorry to have to make ourselves the alteration we suggest, for there would be mechanical difficulties, no doubt, and these the author himself would perhaps have overcome had that been possible. The fact remains that the fable of *May* is not substantial enough to be told in three acts, and that the manner of telling is not quite graceful or artistic enough to reconcile us to the length which seems to be necessary. The action takes place at a farm which Mr. Hall, the scene painter, has pleasantly depicted. The tale is simply that of a romantic country girl, who, while she genuinely loves an honest country lad, is so far fascinated by one Julian Rothsay—who is a local "swell"—that she allows him to make use of a pretended passion for her in order that this may stimulate the sluggish affection of one Edith Lansdell, a young woman who is an heiress in his own rank of life. The farmer, Dolly's uncle and guardian, overhears Mr. Julian Rothsay making rather furious love to the country beauty, and he turns the poor girl out of his house, owing to a quite unnecessary misconception upon his part of the true state of things. Edith Lansdell hears the same vows—and somehow fails to distinguish the ring of them from the ring of the true metal—and she too decides to see what jealousy will work, and so instructs one Sir Barnaby Lapwing—another local "swell," who suffers from very premature old age at six-and-thirty—to flirt with her in Julian's presence, and Sir Barnaby, being a very appreciative man, does not seem to think that flirtation altogether disagreeable. Time passes; Julian has been abroad and has returned; Edith has managed to keep the Baronet at a respectful distance, and the country lad Joe Solly—one of three rustics who have all loved the country beauty—has still believed in Dolly, and has married her. Dolly is received again by the unreasonable farmer; Julian and Edith will marry very soon; the Baronet must console himself elsewhere; and the younger rustic brethren retire to their pursuits with the pitchfork and the milk-pails.

The main fault in the construction of the story is to be found in the fact that the whole bad business of the sham love-affair was capable of so easy an explanation, even though Mr. Julian Rothsay did swear he was in earnest. In a word, you have to suppose an entirely stupid farmer, to grant the possibility of the subsequent complications. The main merit is a certain freshness—a certain attempt to give individuality and life-likeness to types with which the stage is already very familiar—and this attempt is most successful in the case of the three rustic brethren, who are humourously impersonated by Messrs. Cox, Odell, and Terry. The brother played by Mr. Odell is a silly fellow enough: his description of how he was shocked when Edith Landells proposed to waltz with him, at the farm party, is very well given. The brother played by Mr. Cox is a fat poet whose verse is somewhat halting, and who considerably refrains from publishing his poems by subscription. The brother played by Mr. Terry is a man who will rise. He is a clear-headed countryman, and will one day be very prosperous. Mr. Terry represents him with really great truth and naturalness. Mr. C. H. Stephenson looks excellently like the farmer he is meant to be, and acts throughout with much discretion. It is not his fault that some of his speeches are too eloquent for a yeoman who doesn't read the *Daily Telegraph*. Miss Swanborough's Dolly couldn't be heartier or better tempered, but might conceivably be more romantic. Sir Barnaby is not a study from the life: we have seen him on the stage before to-day—whiskers, baldness, *hauteur* and the rest of it. Mr. Terriss could, no doubt, be interesting as Julian, if the author

allowed him to be. And it is, perhaps, rather hard upon Miss Nellie Bromley, that for the space of three acts she should have to be disagreeable; but then it is also rather hard upon the public that when (as in the scene where she overhears Julian vowing his love for Dolly) she has the opportunity of using facial play and gesture, she neglects to take her opportunity, and remains too unmoved to satisfy those who in their estimate of good society would rather rely on living experience than on a dead tradition. But these stage gentle-people are most unnaturally wearisome: they lack the individuality which the author tries to give to his humbler folk; and so Miss Bromley, who has done better things, and will do them again, is not to be very seriously reproached because she fails to realise a character when there is little character to realise. Miss Bromley has a bright moment at the end of the piece; and if she sometimes receives a bouquet in *May*, she generally deserves it in *Eldorado*.

"THE SCHOOL FOR SCANDAL" AT THE PRINCE OF WALES'S.

AMONG frequent and occasional playgoers the surprise was great, and the curiosity greater, when it was announced, a couple of months ago, that the company at the little Prince of Wales's Theatre was preparing to act the *School for Scandal*. Performers whose chief success had been in the smallest of comedies were suddenly to become the interpreters of the greatest. The experiment might succeed, or haply it might fail; but at all events it would appeal to us with momentary force, since there was about it the interest of danger:—

"Our interest's on the dangerous edge of things.
The honest thief, the tender murderer,
The superstitious atheist, demirep
That loves and saves her soul in new French books—
We watch while these in equilibrium keep
The giddy line midway: one step aside,
They're classed and done with."

And then, the position of the *School for Scandal* is thoroughly unique. In one sense there may be higher comedies—comedies which show their authors' more profound acquaintance with human nature; comedies of healthier tone, in the estimation of those who demand that fiction shall be a work of morality more strongly than they demand that it shall be a work of art. And in a certain brilliancy of dialogue Wycherley and Congreve may sometimes surpass it, since the theme for their wit's exercise may be more varied; but take it for all in all—its epigram, its characterisation, its general construction, and the supreme ingenuity of at least one of its situations—there is no stage comedy vying with it in effectiveness. Play it badly, in the assembly-room of an assize town, and it will "draw" better than anything except *Hamlet*. Play it, as it has been played within quite recent memory, and there is no reason, except the weariness of the actors, why it should not become as permanent an institution as the Bank, the Tower, or the waxworks in Baker Street.

One potent attraction which it had not had to the full before remained to be given to it at the Prince of Wales's Theatre. Mrs. Bancroft promised—and the promise has been kept—that it should be produced with unexampled attention to scenery and appointments. It should illustrate last century life, and that would suit the movement of the day. The *Saturday Review's* "aesthetic friend" should die of rapture over the Dutch tiles. People with no blue china of their own, should see Mrs. Bancroft's nankin jars and her Delft platters. People with nineteenth century backs should be stimulated to sit on eighteenth century chairs. Marqueterie should abound. Joseph Surface should shake out his pinch of snuff; Lady Sneerwell should sip tea from a cup like that which Dr. Johnson took so many times from Mrs. Thrale; a noiseless servant should glide about with snuffer-tray among the candles. Nay,

more: there should be a spinnet, and four grave music-makers should do their spitting gently, while Mr. Crabtree and Lady Sneerwell, Sir Benjamin and Lady Teazle, danced out a minuet of which there is no mention in the comedy.

Well, all this has been done, and it is very real and very pretty, but it has been purchased at too great a cost. No acting but the finest could endure the juxtaposition of this material show, which crushes the imagination instead of appealing to it; or, to be more exact, it leads the imagination very thoroughly indeed into last century life, where, amidst a multiplicity of details, Sir Peter Teazle's fortunes are forgotten. There is only one occasion on which the stage is not thoroughly furnished. The scene representing the lobby at Charles Surface's is painted on a curtain that rolls down and up again. That scene is remarkably well painted. Roughly enough, it suggests an interior by McKewan; and its very excellence shows once for all for what a ghost of an object the Prince of Wales's management has effected those alterations in the sequence of scenes which the determination to keep real interiors always before the eye rendered inevitable. It is hardly possible that any one can imagine these alterations in the sequence of scenes to add in the slightest degree to the interest of the story. The alterations are ingenious, but their good effect is wholly in favour of the stage decoration. Sometimes the later part of a scene is taken at the beginning. It is so with the second scene of the first act, where the order of the conversation between Sir Peter and Rowley is almost entirely reversed. Then the first quarrel scene between Sir Peter and Lady Teazle is made to take place in Lady Sneerwell's drawing-room. It is there, in the common reception-room of an acquaintance, that Lady Teazle taunts her lord, and there, subject at any moment to sudden interruption, that her lord roars back his defiance, and shouts to her of the time when she was content to ride double behind the butler on a docked coach-horse. An alteration of this kind does not require any comment.

I do not find in Sheridan any reference to the fact that this docked coach horse was named "Dobbin," but as the additional information may have crept into a corrupted stage edition, and the corruptions have been studiously preserved, we will not charge it on the gentleman who plays Sir Peter at the Prince of Wales's. In the second quarrel scene, the Prince of Wales's Lady Teazle says, "Yes, yes, yes, yes, yes," where I think it can hardly be in *any* acting edition, though it may well be a traditional "gag." But Mr. Joseph Surface's offer to help Sir Peter off with his great coat is a contribution to the comedy, which I take to be of somewhat recent origin. And some of Lady Sneerwell's observations, at the Prince of Wales's, are necessitated only by the re-arrangement of so many of the scenes.

It is plain that great care has been bestowed upon much of the acting, but it is equally plain that no amount of care would make the performance a wholly satisfactory one. Yet there are characters which are well represented, and bits of stage "business" introduced, which have the real merit of probability as well as the spurious and more generally acceptable advantage of novelty. When old Crabtree and Sir Benjamin Backbite pour into the ears of Joseph Surface the news of his brother's ruin, it has been too much the custom for them to wheel round him like a mill-horse, discharging each in his turn the following remarks:—

Sir Benjamin. Mr. Surface, I didn't mean to hurt you; but depend on't your brother is utterly undone.

Crabtree. O, Lud, ay! Undone as ever man was—can't raise a guinea.

Sir Benjamin. And everything sold, I'm told, that was movable.

Crabtree. I have seen one that was at his house. Not a thing left but some empty bottles that were overlooked, and the family pictures, which I believe are framed in the wainscots.

Sir Benjamin. And I'm very sorry also to hear some bad stories against him. [Going.]

Crabtree. Oh! he has done many things; that's certain.

Sir Benjamin. But, however, as he's your brother—

[Going.]

Crabtree. We'll tell you all, another opportunity.

Both [by stage tradition.] As he's your brother, we'll tell you all, another opportunity.

[Exeunt Crabtree and Sir Benjamin.]

Now, at the Prince of Wales's this scene is ended in a less farcical way. One laughs a little less, but it is certainly more reasonable. Crabtree, going, remembers something else, and so comes back to say it. So does Sir Benjamin; and they do not circle round Mr. Surface, and pour on him their stream of malice aforethought. Again, there is a clever little touch at the end of the screen-scene, where Mrs. Bancroft makes Lady Teazle stumble in leaving the presence of her offended husband. Joseph Surface moves quickly to her rescue. She rejects his arm; looks for an instant at her husband, who is still motionless and unappeased, and goes out crying. And as I am now touching on Lady Teazle let it be said at once that the screen-scene is played by Mrs. Bancroft with very genuine appreciation of its seriousness. The appreciation of its seriousness is certainly much happier than the execution. Mrs. Bancroft "takes" the scene, as a musician might say, very slowly, and so gains for it a certain gravity and momentousness, and her voice is well under her control, and is as expressive as it ought to be: now steady, now trembling, and now quite broken down. The play of her features does not second the play of her voice. Emotion seems to be wanting to the face. But on the whole this scene is more satisfactory than the earlier ones, and it is surprising that it should be so. It is surprising that the earlier scenes should lack in Mrs. Bancroft's hands the buoyancy of animal spirits. There is a good-natured French malice about her—if that phrase may be understood—but I miss the brimming and bubbling pleasure, the merry church-daw's chatter, the keen sense of a delightful world, where beauty is a boon, and flattery sweet, and repartee still sweeter, which mark the Lady Teazle of my own humble ideal.

The character most thoroughly acted is that of young Sir Benjamin Backbite, by Mr. Lin Rayne. The actor lives completely in the part. He is delightfully fresh, and delightfully malicious. You feel it costs him nothing to produce a lampoon; he makes an epigram as easily as a bow. Nor is Mr. Coghlan, as Charles Surface, going at all beyond the scope of his ability. He is at once light, airy, careless, and good-hearted, and one must single out for special praise in his performance his delivery of the raillery when the screen has fallen and Lady Teazle is disclosed. At this point, too, many actors forget that if Charles Surface was a man of loose life, he was a man of gentle breeding. He could not have given way to noisy exultation when Sir Peter's happiness appeared to be ruined. Nor does Mr. Coghlan do this. The silence is an awkward one. He needs must break it. He cannot possibly break it by reference to some indifferent subject—the effort would be too obvious for that. So he touches lightly on the burning question of the moment; treats it as if it were much less than he thinks it to be. And he turns on his heel, and is gone—they must settle it for themselves. Mr. Bancroft plays Joseph Surface in a very reasonable way, but the performance can in no sense be called a creation. There is thoughtfulness and care; but there is want of subtlety: want of variety of expression. Miss Fanny Joseph's Lady Sneerwell is the performance of a practised actress. She is at ease upon the stage, and says her say gracefully, but where is the individuality of Sheridan's figure? Where is the "delicacy of tint"? Above all, where "the mellowness of sneer"? This is not the person who "can do more by a word or a look than many by the

most laboured detail." Mrs. Leigh Murray appears as Mrs. Candour, Mr. Wood as Crabtree, and Mr. Collette as Sir Oliver. And if one speaks of other minor characters before alluding to the most conspicuous of the failures, one must say that Snake would gain reality if he took part in the conversation rather less with the tone of one who knows the conversation by heart, and that if Maria were a little less tame she would be a little more possible—as it is, her acting is quite careful, and at the same time quite spiritless. But these are slight things, in comparison with such a figure of Sir Peter as is presented by a recognised and often successful actor—Mr. Hare. To begin with, he makes up his face to exaggerate the common mistake as to Sir Peter Teazle's age. The play bears internal evidence that Sir Peter is not fifty-two years old. Mr. Hare behaves, in so far as he commands his behaviour, as if Sir Peter were eighty years old. A little wizened face, a little old man's restlessness, a weak man's nervousness—this is Mr. Hare's voluntary contribution to the performance of the part. And with these characteristics of senility he joins the voice of a man hardly middle-aged, and the occasional drawl of a youth who must have loitered in the Piccadilly of our day. For the real Sir Peter, his voice is much too strong; for the Sir Peter he imagines, it is ludicrously strong; his utterance sometimes is too steady, sometimes too swift, and always too decided. His Sir Peter is no shrewd man, marred by peevishness; but a weak man whose day is long gone by. Was it, do you think, in the nature of Sheridan to conceive that Lady Teazle should ever be reconciled to this shivered wreck of humanity, whom Mr. Hare—with crowded reminiscences of the ancient pop of Robertsonian comedy—has chosen to bring before us with curious and ill-fated completeness?

To sum up, Mrs. Bancroft's intention in producing the *School for Scandal* was no doubt a laudable and artistic one, but the result of the experiment is to give the playgoing public the least salutary of spectacles—the spectacle of fine and luxurious appointments, showing up in strongest relief much acting that is very mediocre, and some that is pitifully feeble.

FREDERICK WEDMORE.

It is not a very easy task to keep up with the managers' activity this Easter. Some twenty theatres are open at the present moment at the west end of London and in the suburbs that adjoin it. Below will be found, culled from various sources, brief notices of such works as have not been treated in detail by the writer whose contribution precedes these paragraphs.

THE Globe Theatre has produced a new piece, written by Mr. Albery for Mr. Toole, who is playing there before his departure for America. We read in the *Times*:—

"There is a broad resemblance, necessarily unintentional, between Mr. H. J. Byron's *Thumbscrew*, brought out last Saturday at the Holborn Theatre, and Mr. J. Albery's *Wig and Gown*, brought out on Easter Monday at the Globe. Both have obviously been written for the sake of the actor who sustains the comic part, and who in one case is Mr. J. S. Clarke, in the other Mr. J. L. Toole; in both the comic part is that of a starving lawyer, with a large family, in one case a solicitor, a barrister in the other, and awakens a lively reminiscence of Mr. Micawber; in both the plot hinges on the claim of an impostor to a large estate. There is, however, this difference in the treatment of what may loosely be called a common theme: Mr. Byron seems to have thought that while writing a piece in five acts, however short, he was about to attempt exciting a serious interest, even if he did not succeed. Mr. Albery has been manifestly convinced that the one purpose of his piece is to be droll, frivolous if you will, absurd if you will, but, at all events, unmistakably droll."

Mr. Toole is supported by Mr. Arthur Cecil, Mr. Lionel Brough, Miss Carlotta Addison and others. The laughter with which the piece is re-

ceived will surely be conducive to its long life.

MR. BYRON's new piece at the Holborn is in five acts; but five acts do not necessarily give a play a claim to be a "legitimate drama," and if Mr. Byron has succeeded in his purpose, it has not been a very serious one—he has afforded ample means for people to laugh at Mr. J. S. Clarke, the American comedian, whose Dr. Pangloss in *The Heir at Law* drew all playgoers to the Strand some three or four years ago. *The Thumbcrew* is the name of Mr. Byron's piece, which would have been called *Black Mail* if Mr. Watts Phillips had not been discovered to possess that title.

MR. BURNAND's name answers somewhat for the character of the *Great Metropolis*—the merry afterpiece in which Mr. George Honey appears at the Gaiety. The music is arranged by Herr Meyer Lutz. And Mr. Hollingshead, who scorns no branch of art or gymnastics, has enriched the cast by the engagement of two eccentric dancers. But the chief piece of the evening at the Gaiety is the old comedy of *The Clandestine Marriage*, of which next week some better account than the present brief notice will be given in these columns.

Love's Paradise is the name of a new mythological extravaganza at the Haymarket. It appears to be written not so well as it is acted. Messrs. O'Connor and Morris have provided it with scenery.

THERE is a new comedietta at the Court, played after *Ready Money Mortiboy*. It is written by Mr. Herbert; is acted by Miss Litton, Mrs. C. Cooper, and Mr. Bruce, and is called *Second Thoughts*.

A RAPIDLY organised company—headed by Mr. Ryder and his pupil Miss Leighton—play Shakspeare at the Queen's. The Criterion opened so lately that there is no change in the play-bill there. Nor is there any alteration at the Olympic. The Adelphi too keeps the bill of the past week or so. Mr. Irving still appears in *Philip* at the Lyceum. And at the Vaudeville, in addition to the burlesque, *London Assurance* retains its place in the performance of the evening, thanks to the meritorious efforts of the entire company, and to the specially excellent acting of Mr. Farren and Miss Amy Fawcett.

MUSIC.

NEW MUSICAL PUBLICATIONS.

THE quantity of new music which, both in this country and abroad, is continually issuing from the press, is so enormous, that it is obviously impossible, in a paper not exclusively devoted to musical topics, to keep pace with it at all. We refer here, not so much to larger and more important works, which if noticed in this paper require and deserve a somewhat detailed review, but rather to pianoforte pieces and songs, which constitute the larger portion of new publications. Inasmuch, however, as there is doubtless among the readers of the ACADEMY a considerable number of pianists and vocalists who may be glad to have their attention directed to new music which is really worthy of their notice, it is thought advisable from time to time to devote a short space in these columns to an enumeration of some of the more important and valuable pieces of this class which make their appearance.

First in interest among those which lie before us is a posthumous work by Robert Schumann *Etudes Symphoniques, Suite de l'œuvre 13* (Berlin: Simrock). The great "Symphonic Studies" in C sharp minor are not only among the best known, but also among the most prized of Schumann's pianoforte works. As models of the variation-form they display a richness of invention and variety of detail so great that no feeling of incompleteness is possible; and the subject would seem at first sight to be fairly exhausted. Yet as a

further proof of the fertility of the composer's imagination, there are here given five more variations on the same theme, which are not only fully equal in interest to their predecessors, but entirely different from them. To advanced pianists this work can be warmly recommended.

The pianoforte music of Joachim Raff is as yet but little known in this country. Messrs. Stanley Lucas, Weber, & Co. have therefore done a good work in reprinting his admirable *Suite en Mineur* (Op. 72), a composition full of power and originality. It is in five movements, three of which (the "Prelude," "Minuet," and "Fugue") are in Raff's best style, showing not merely much invention, but a perfect mastery of technical detail and contrapuntal contrivance. They are also by no means exacting in their demands upon the player. The same can hardly be said of this composer's *Suite en Ré*, Op. 91 (Leipzig: Peters), a work from a purely musical point of view perhaps even superior to the one just noticed, but which is hopelessly beyond the reach of any but first-class pianists. The second movement of this work, a "Giga con Variazioni," is as beautiful as it is difficult—which is saying not a little. Less classical, and more in the conventional "drawing-room" style are three pieces by the same composer, *Am Loreley-Fels*, *Abends*, and *Lohengrin* (Augener & Co.). These are not only excellent and interesting in their ideas and treatment, but (though not exactly easy) within the power of good amateur players. The fantasia on Wagner's opera is especially clever, and likely, now that this composer's music is the object of so much curiosity, to find general favour.

Première Sonate pour Piano, par Anton Rubinstein, Op. 12 (Leipzig: Peters), is a reprint of an early work of this composer, which is free from many of the blemishes that so largely characterise his later compositions. Here are to be found not only charming ideas, but a clearness of form for which Rubinstein cannot always be commended. There is, it is true, an occasional tendency to diffuseness, especially in the finale, but not to such an extent as materially to mar the enjoyment of the work. Those who are curious in tracing accidental coincidences will be amused at the strong resemblance between the theme of this finale, and a well-known melody (by Offenbach) one of the last composers in the world with whom Rubinstein has anything in common.

The charming little "Gavotte" from Gluck's *Don Juan*, transcribed for the piano by Hermann John (London: Stanley Lucas, Weber & Co.), needs only a word of mention. It cannot fail to be a favourite wherever known. Some of our readers may remember that it was played by Dr. Bilow during his recent visit to London.

The numerous admirers of Stephen Heller's music will gladly welcome his third series of "Dans les Bois" (London: Ashdown & Parry). Few writers for the piano have a more pronounced individuality than Heller, and all the six pieces of which this series is composed, are marked with the stamp of his originality in an unmistakable manner. Four of the numbers are inscribed with titles suggested by *Der Freischütz*, and may therefore be described as "character-pictures." All are so good that it is impossible to select any for special praise. While requiring very finished playing, with much attention to touch and phrasing, they are quite practicable by moderately advanced players.

Mr. Charles Salaman's *Six Characteristic Melodies* (London: Lamborn Cock), deserve a larger space than it is possible for us to devote to them. They are a set of very elegant and graceful little drawing-room pieces, good enough to satisfy classical tastes, and sufficiently pleasing to attract even those who would think a sonata "heavy." To those who are familiar with Mr. Salaman's music, it will be sufficient to add that these pieces are in his best manner; to those who do not know it, the best advice to be given is to make its acquaintance at once.

The March numbers of *The Musical Monthly* (London: Enoch & Sons), edited by Sir Julius Benedict, offer, for a ridiculously small sum, a really good collection of instrumental and vocal music. The "Edition A" comprises five pianoforte pieces, by Fr. Baumfelder, J. Rummel, E. Silas, Carl Chesneau, and Paul Wachs, very various in style, but all of more or less merit; while the "Edition B" gives five new songs by Abt, Henry Smart, G. Serpette, P. Malvezzi, and F. G. Jansen, thus suiting alike the tastes of the lovers of English, German, French, or Italian music.

L'Organiste Pratique (1^{re} livraison) par Alex. Guilmant (London: Schott & Co.), is a collection of six pieces for the organ, by the well-known organist of the church of La Trinité at Paris. While written in a less severe style than that which we are accustomed to consider appropriate for the organ, they are at the same time without a trace of that frivolity too often associated with French music for the instrument. The "Offertoire" (No. 2), the "Marche" (No. 3), and the "Offertoire sur des Noël's" (No. 6), are among the best numbers of the series. The pedal part is, with one or two unimportant exceptions, *ad libitum*; and the general usefulness of the work is largely increased by the fact that the pieces can also be played on the harmonium, the requisite directions as to the stops to be used on that instrument being in every instance given.

O Salutaris pour Voix de Basse, ou de Baryton, avec Accompagnement d'Orgue, par Alex. Guilmant (Schott & Co.), is a really fine setting of the well-known Latin hymn, which, if well sung, would be sure of its effect.

There still remain to notice a number of new songs, all published by Stanley Lucas, Weber & Co., which are of more than average excellence. First is "Fly, little song, to my love," by A. Cellier, which is marked by a commendable avoidance of commonplace. In her setting of Longfellow's lines, "The day is cold and dark and dreary," Madame Rudersdorff shows herself a thorough musician. The spirit of the words is faithfully produced, and the song is excellent, though perhaps hardly in a style to be largely popular. "My Home of Yore," by Louis Liebe, is a very pleasing specimen of the modern German *Lied*, as also, in an entirely different style, is "Oh! could it remain so for ever," by Anton Rubinstein, a song so thoroughly original, both in melody and treatment, that its beauties can hardly be fully appreciated till one becomes familiar with it. Lastly, there is a charming little song, "The Days of Merry Spring-time," by Mr. H. A. Rudall, one of our most accomplished amateurs, which can be recommended most cordially.

EBENEZER PROUT.

THE principal feature of the last Saturday Concert at the Crystal Palace was a very good performance of Mendelssohn's *Lobgesang*, in which the solo parts were sustained by Madame Lemmens-Sherrington, Miss Katherine Poyntz, and Mr. Vernon Rigby. It was a real treat to hear the three instrumental movements with which the work commences so finely played as they were by Mr. Mann's orchestra. The organ part, which Mendelssohn has written in full in the score, was played with great judgment by Dr. Stainer. It was, however, a mistake to defer the entry of the principal vocalists on the platform till the close of the opening symphony, as the first chorus is expressly marked to follow without a pause, and the needful continuity was thus lost. In addition to the *Lobgesang*, the programme comprised Bennett's picturesque fantasia-overture to "Paradise and the Peri," songs by Madame Sherrington and Miss Poyntz, and Brahms's "Song of Destiny," which was repeated by special desire, and which, from increased familiarity with it on the part of both chorus and orchestra, was even more effective than at its previous performance.

THE last concert for the present season of the British Orchestral Society took place on Wednesday evening last, when a very attractive programme was presented to the subscribers. English art was represented by Mr. J. F. Barnett's overture to "A Winter's Tale," and Mr. Arthur Sullivan's "Ouverture di Ballo." The former work was composed for this society, and first performed on February 6, 1873. Though somewhat reminiscent in style of Mendelssohn and Spohr, it is most excellently constructed and effectively scored. Mr. Sullivan's light and sparkling overture was written for the Birmingham Festival of 1870, and has since been repeatedly heard at the Crystal Palace and elsewhere. Its themes are very pleasing; but we think the work would gain considerably by judicious compression. The only absolute novelty of the evening was the Scherzo from Sir Julius Benedict's new, and as yet unfinished, second symphony. Judgment on this movement must, in fairness to the composer, be deferred till we can hear it with its context. Schumann's Concerto in A minor was excellently played by Mr. Walter Bache, and the programme also included Beethoven's Pastoral Symphony, Glinka's Fantasia "Kamirinskaja," and Cherubini's "Anacreon" overture. The performance, as a whole, was distinguished by spirit rather than finish, the accompaniments to the concerto in particular being coarse and unsatisfactory. The Duke of Edinburgh honoured the concert with his presence.

THERE is a rumour of a probable performance at Drury Lane of Mr. Alfred Holmes's opera *Jeanne d'Arc*, the principal part being sustained by Mlle. Titiens. Some of our readers will remember that two of Mr. Holmes's overtures have been produced with success at recent concerts—one at the Crystal Palace, and the other at the British Orchestral Society.

WAGNER's *Tristan und Isolde* is to be revived at Weimar during the latter part of June. The rôles of Tristan and Isolde will be sung by Herr and Frau Vogel, from Munich, and the part of Brangäne will be in the hands of Fräulein Brandt.

MOZART's *Don Juan* has recently been given at Rome, for the first time in the "eternal city," as the papal censorship has always previously forbidden the performance of the opera. The success, chiefly owing to the very inadequate presentation of the work, was but small.

THE success of Wagner's *Rienzi* at Venice, the production of which was noted in last week's ACADEMY, is said to have been but doubtful, in spite of the excellence of the cast.

HANS VON BÜLOW gave his first concert in Moscow on March 25.

THE statue of Donizetti, which the deceased music publisher Lucca presented to the city of Milan, has lately been unveiled in La Scala theatre, and is described as an excellent specimen of the workmanship of the sculptor, Signor Strazza.

POSTSCRIPT.

WE learn with regret that the painter Wilhelm von Kaulbach, of Munich, died of cholera on Tuesday, the 7th inst. Kaulbach was one of the greatest of the pupils of Cornelius, but left the well-known Düsseldorf school for Munich as long ago as 1825. His death is a very serious loss to German Art.

LIEUTENANT GRANDY's brother has left him, and returned to England without any satisfactory explanation, and bringing no letters. It appears that Lieutenant Grandy is making strenuous efforts to penetrate into the interior, in the face of great difficulties. One hundred and fifty miles beyond San Salvador he encountered a powerful

tribe, which positively refused to allow a white man to pass through their country. He now intends to make an attempt to advance on the north side of the Congo.

WE are informed that the rumours which have appeared in the papers about Dr. Livingstone's body lying in state at the Geographical Society's rooms are an exaggeration of the truth. The Committee of the Council have agreed to set apart the Council Room for the reception of the body; but all arrangements are left in the hands of Mr. Webb, Mr. Waller, and the Traveller's family. The place where the *Daily Telegraph* says the body was stopped by the chiefs is not Gogo but Ugogo. Finally, as to the fracture of the arm by a lion, to which we first drew attention some weeks ago, as a means of identifying the body: the arm was set by a native doctor in Africa, and badly set, so that, on his return to England, Livingstone had to be attended for it by a medical man. It is this gentleman, and not the doctor who set the arm, as the *Telegraph* states, who is to examine the body with a view to its identification.

ACCORDING to the *Musikalisches Wochenblatt*, the building of the Wagner Theatre at Bayreuth is advancing more rapidly than ever, so that there is the best foundation for the hope of enjoying the promised performances in the summer of next year.

THE last two numbers of the *Neue Zeitschrift für Musik* contain two admirable papers by Herr Louis Köhler, well known as a teacher and writer for the piano, entitled "Das Pianistenthum." Herr Köhler discusses the influence of Liszt and the bravura style of playing on the younger generation of pianists, and their rendering of classical music.

SALES BY AUCTION.

Re J. Morby & Co.—Important Modern Pictures and Water Colour Drawings.

MESSRS. FOSTER respectfully announce for SALE BY AUCTION, at the Gallery, 34 Pall Mall, on WEDNESDAY NEXT, April 15, and Following Day, at One o'clock precisely, an exceedingly valuable ASSEMBLAGE of high-class MODERN PICTURES and WATER-COLOUR DRAWINGS, including a large number of choice examples by the most popular artists, and particularly by the following:

Fd. Bridgell	Dargatz	A. Johnston	C. Stanfield, R.A.
F. Barnard	T. Danby	John Linnell	G. Stanfield
A. Burr	Douglas, R.A.	E. Long	F. Scheffer
Sir A. Calcott,	W. E. R. R.A.	Emile Levy	E. Stone, A.R.A.
R.A.	W. P. Frith, R.A.	W. Mullet	Truher
W. Collins, R.A.	E. Freer	Maurer	Ten Kate
J. Constable,	Sir John Gilbert	J. E. Millais,	Thurmermans
R.A.	E. Hayes	R.A.	R. Wilson
E. W. Cooke,	J. Herring, sen.	M. Whistler	Weber
R.A.	J. C. Horsley,	P. Nasmyth	Weeks
Old Crome	J. C. Horsley,	J. B. P. Oakes	Haynes William
R. C. Dobson,	J. Herbert, R.A.	J. Phillips, R.A.	James Webb

Also Water-Colour Drawings by—George Barrett, Copley Fielding, Lunzrun, George Birket Foster, F. Smallfield, S. Prout, David Cox, C. E. Johnston, Carl Werner, De Witt, On view Monday and Tuesday next, when Catalogues may be had, or will be forwarded on application to Messrs. Foster, 34, Pall Mall.

The Collection of Porcelain of the late Mrs. GOLDING.

MESSRS. CHRISTIE, MANSON & WOODS respectfully give notice that they will SELL BY AUCTION, at their Great Rooms, King-street, St. James's-square, on MONDAY, April 13, at 1 o'clock precisely (by order of the Executors), the COLLECTION OF PORCELAIN of the late Mrs. SARAH P. GOLDING, of 34 West Cromwell-road, Kensington, comprising specimens of Oriental, Dresden, Sevres, Chelsea, Bristol, Derby, and Worcester Porcelain, Ormolu Candelabra, Bronzes, Cabinets, and other ornamental objects. May be viewed two days preceding, and Catalogues had.

The SALAMANCA Collection.

MESSRS. CHRISTIE, MANSON & WOODS respectfully give notice that they will SELL BY AUCTION, at their Great Rooms, King Street, St. James's Square, on TUESDAY, April 14, and Following Day, at 1 o'clock precisely, the important COLLECTION OF PORCELAIN OBJECTS and ARTICLES of VALUE from the Palace of the MARQUESS OF SALAMANCA at Madrid and Vista Alegre; including a set of four fine panels of Gobelin Tapestry, with subjects from the history of Medea, designed by De Troy, presented by Louis XVI. to the Spanish Ambassador, Count d'Aranda, and other fine pieces of Gobelin, Aubusson, Barcelona, Madrid, and Flemish Tapestry—Fine Limoges Enamels by P. Courtois, J. Courtois, P. Raymond, and J. Penicaut II.—Carvings in Ivory and Rock-crystal, Majolica, Spanish Fayence—large Vases of Chinese Porcelain—Carved Wood Cabinets, &c. May be viewed two days preceding, and Catalogues had.

Collection of Engravings and Drawings.

MESSRS. CHRISTIE, MANSON & WOODS respectfully give notice that they will SELL BY AUCTION, at their Great Rooms, King Street, St. James's Square, on THURSDAY, April 16, and Following Day, at 1 o'clock precisely, a valuable COLLECTION OF ENGRAVINGS and DRAWINGS, formed during the latter part of the last century. The Engravings comprise some of the Works of M. Antonio Bonasone, Albert Dürer, Van Meek, M. Schoen, L. Van Leyden, &c.—Etchings by Rembrandt, Ostade, Callot, &c.—the Works of Sir P. Robert Strange, and others by R. Morghen, De Meyere, Wille—Drawings by old Italian and Dutch Masters, and others by P. Sandby, Morland, &c. May be viewed two days preceding, and Catalogues had.

EVERY SATURDAY, and to be had, by Order, of all Booksellers and Newsmen.

PRICE FOURPENCE.

THE

ACADEMY

A WEEKLY REVIEW OF

LITERATURE, SCIENCE, ART, MUSIC, AND THE STAGE,

Will contain:

REVIEWS and NOTICES of all important New Books, English and Foreign.

REPORTS of TRAVEL, EXPLORING EXPEDITIONS, &c.

ENGLISH LANGUAGE, ANTIQUITIES and FOLKLORE.

NEWS LETTERS from Foreign Countries.

CORRESPONDENCE between Literary Men.

PUBLISHERS' ANNOUNCEMENTS.

NOTES on the PROGRESS of SCIENTIFIC DISCOVERY in all branches.

CRITICISMS of the PICTURE GALLERIES, of the STAGE, and of MUSIC.

OPINIONS OF THE PRESS.

"The ACADEMY may fairly claim the first place among literary journals as the representative of the ripest and soundest English scholarship; and its criticisms of art, literature, music, and the drama are informing, incisive, and trustworthy. It is hardly possible in a few words to give an idea of the excellence of this old journal in its new form, but every subject with which it deals (and it deals with many untouched by other papers) is entrusted to the hands of men who know what they are writing about, and the result is a freshness and fulness of information and an accuracy of judgment which commands confidence, and ministers to the intellectual satisfaction and pleasure of the reader. . . . The accomplished and scholarly dramatic critic of the ACADEMY, Mr. Frederick Welmore, the novelist, whose theatrical notices are perhaps the best in style and the most trustworthy now appearing in any London journal."—*Manchester City News*.

"Our contemporary the ACADEMY has suddenly sprung into a great literary position, and is full of instructive and interesting matter."—*Spectator*.

"The ACADEMY, in its new and enlarged form, has a promising look. Its size is that of the *Athenaeum*, and the general arrangement of its contents does not differ much from that of its venerable and not too enterprising contemporary. The great distinction between the two is that the articles of the ACADEMY are signed. . . . It will be seen that there is no lack of strong names. But strong names will not of themselves float a new paper. The editing, the general tone, the make-up of it are more important, and of these too a good report can be given. . . . Altogether, the ACADEMY is very readable, and bids fair to be a formidable rival to the *Athenaeum*, which, for that matter, it might speedily and easily surpass in certain respects."—*New York Tribune*.

"We can confidently recommend the ACADEMY to our readers. Its price is fourpence, and all its papers and reviews are signed by their writers, whose names have a high position in literature and art."—*London Figaro*.

THE ACADEMY will pursue the purely practical aim of being a guide and source of information to all educated persons.

PUBLISHED BY

WM. GREIG SMITH, 43 Wellington Street, Strand.

TRÜBNER & CO.'S NEW PUBLICATIONS.

THE GEOGRAPHICAL MAGAZINE.

Edited by CLEMENTS R. MARKHAM, C.B., F.R.S.

NEW WORKS.

The TEMPLE BAR MAGAZINE for APRIL, in which is continued a New Serial Story by Mrs. LYNN LINTON, entitled

"PATRICIA KEMBALL,"

and which also contains part of Major WHYTE-MELVILLE'S New Story, "UNCLE JOHN," and other Articles and Stories. Price 1s.

"One can never help enjoying 'Temple Bar.'"—Guardian.

The LIFE and LABOURS of ALBANY

FONBLANQUE. Including his Contributions to the Examiner. Edited by his Nephew, E. B. DE FONBLANQUE. 8vo, 16s.

"We have, perhaps, said enough to convince our readers that Lord Lytton scarcely exaggerated when he compared Fonblanque with Swift, and we are sure the contents of this volume will be read again and again by those who appreciate wit and wisdom. As for journalists and political writers, they can scarcely find a more brilliant model, in close and vigorous reasoning, terse and lucid expression, and an almost unrivalled wealth of apposite illustration."—Times.

"Extracts from the works of the prince of modern political writers. A book to buy."—Penny Fair.

TERESINA PEREGRINA; or, Fifty Thou-

sand Miles of Travel Round the World. By THERESA YELVEYTON, Lady AVONMORE. 2 vols. post 8vo, 21s.

Including visits to Salt Lake and the Yosemite Valley, the Sandwich Islands, China and Siam, The Straits Settlements, Sarawak, the Indian Archipelago, Ceylon, India, &c., &c.

"As we have observed already, the authoress is an adventurous and indefatigable traveller, and saw sufficient in the course of her wanderings to furnish material for a dozen ordinary books of travel. She skips all commonplace bits of journeying from place to place, and only dwells upon the scenes that were best worth describing. . . . In conclusion the authoress went quite out of the beaten tracks and had much to tell that is fresh and new, and her volumes make lively reading."—Full Mail Gazette.

ANECDOTE LIVES of the LATER WITS

and HUMOURISTS: Canning, Captain Morris, Curran, Coleridge, Lamb, Charles Mathews, Talleyrand, Jerrold, Albert Smith, Rogers, Hood, Thackeray, Dickens, Poole, Leigh Hunt, &c. By JOHN TIMBS, F.S.A., Author of "A Century of Anecdote." 2 vols. crown 8vo, 21s.

"A fund of agreeable reading which may be dipped into at any place or at any moment with the certainty of something worth having being brought up."—Daily News.

HISTORY of the INDIAN ADMINIS-

TRATION of LORD ELLENBOROUGH, in his Correspondence with the Duke of Wellington. To which is prefixed, by permission of Her Majesty, Lord Ellenborough's Letters to the Queen during the Afghan War. Edited by LORD COLCHESTER. 1 vol. 8vo, 18s.

THE LIFE of GREGORY the SEVENTH.

By M. VILEMAIN, of the French Academy. Translated by JAMES BADER BROCKLEY. In 2 vols. 8vo, 26s.

"The translation is easy and flowing, and on the whole good, and will well repay perusal."—Athenæum.

THE NEW AND POPULAR NOVELS.

The MYSTERY of ASHLEIGH MANOR.

By ELIZA RHYL DAVIES. 3 vols. crown 8vo.

"Three volumes of thrilling interest."—Penny Fair.
"The authoress displays very considerable dramatic faculties, and there is a very marked and remarkable individuality in the book. Its effect as a whole is startling and even impressive. The story is weird and ghastly enough to please any amateur of horrors."—Daily News.

"We can fairly pronounce the book to be one of the most promising we have seen for many a day, and we hope that Miss Davies will give us another still better."—Academy.

AT HER MERCY. By the Author of

"Lost Sir Massingberd." 3 vols. crown 8vo.

NO INTENTIONS. By FLORENCE

MARRYAT, Authoress of "Love's Conflict," &c. 3 vols. crown 8vo.

WON in a CANTER. By "Old Calabar."

3 vols. crown 8vo.

PHILIP LEIGH. Reprinted from the

"Temple Bar Magazine." 1 vol. crown 8vo.

"From the beginning to the end the attention of the reader is rivetted by the interest which attaches to the story itself, and by the admirable manner in which it is written. The story is charmingly told."—Western Daily Mercury.

LITERATURE.

The Life and Times of Robert Gib, Lord of Carribber, Familiar Servitor and Master of the Stables to King James V. of Scotland. By Sir George Duncan Gibb, Bart., of Falkland and of Carribber, M.A., M.D., LL.D. (London: Longmans & Co., 1874.)

THE modesty of Dr. Gibb is surprising. After presenting his scientific works, in which he describes himself as Sir George Duncan Gibb, Bart., to the chief public libraries of England, Scotland, and Ireland, after announcing his intention to deposit his biography by himself in the British Museum, after appearing at sundry meetings of the British Association as a celebrity, after publishing innumerable pamphlets and memoirs, he now appears as an ingenuous and timid young writer, and informs his readers that:—

"as this is the first occasion we venture before the general public, we throw ourselves upon their indulgence, not only for some errors of omission and commission, but for the dry nature of the information we have had to convey, in some parts of the work."

This indulgence cannot be granted. We think it may be of some use that this worthless work should be briefly noticed, and its grave errors of omission and commission summarily exposed. It is, under the disguise of a family history, an attempt to construct a family, and establish a title to a baronetcy, which would be at once rejected, if presented to any competent Court. The full publication of our national records would speedily be rendered ridiculous, if it led to other books of this kind being written. We have faint hope of repressing Dr. Gibb's antiquarian ignorance, but his example may, perhaps, deter others from following the same strange paths. The illustrious but till now obscure family of Gib is ushered in to us by these volumes as "one of the oldest in Scotland,"—a character which it possesses in common with most Scotch families of which we have read the histories. It is said, without any authority, to be a branch of the De Guibe family of Brittany and Normandy that accompanied the invading army of William the Conqueror as sergeants-at-arms. If the ancestors of all the families that we are now told accompanied the Conqueror really did so, the conquest of England ceases to require any explanation. It is, however, with the history of four Gibs remote from the Conquest, and supposed by the author to be his ancestors, that this book is made up. The first is Robert Gib, called by Dr. Gibb Lord of Carribber and Master of the Stables to King James V. His lordship of Carribber turns out to be a small message on the bank of the Avon, near Linlithgow, which he acquired in 1539, and the pretentious title

of Master of the Stables implies that he was a stirrup-man of James V. In narrating his title to what he calls the Barony of Carribber, Dr. Gibb, unfortunately for the credit of the Transatlantic University which made him M.A., quotes a Latin Charter and Precept (i. p. 104), the errors of which can scarcely be laid to the charge of the printer, in which "suos" is made to agree with "heredibus," and a new Latin word "totio" is discovered, a discovery as remarkable as that of an unknown Archbishop of Canterbury, of course a relation of the Gib family, which Dr. Gibb has made in a subsequent part of his work. The attempt to make the history of the times circle round the stirrup-man of James is the greatest length to which this common folly of biographers has ever gone. Of Elizabeth Shaw, the wife of Robert Gib, Dr. Gibb gives this singular panegyric:—

"She had been one of the first to acquire the king's love, when very young, and as the latter circumstance was not considered a venal act in those days, more especially with the Sovereign, she became a good and virtuous wife, and bore her husband a family of several children."

One of these children, John Gib, of Knock, is the second person, to whose biography (if extracts from all the records in which he is named, and from a good many in which he is not, can be so styled) we are introduced. Like his father, he was one of the king's servants, and he is described in various registers as "ane of the vallettis of our sovereign lord's chalmers," under James VI. Like his father, he was a successful suitor for offices, pensions, and gifts; and he was, according to Dr. Gibb, knighted by King James, at Theobalds, on October 5, 1624. Here, however, as in many other instances, the authorities quoted throw doubt upon rather than confirm the honours claimed, for the knight made in that year is named Henry, and not John, in the list of knights referred to (Harl. MS., 6062, Brit. Mus.). A chapter is next inserted on the family of Young, supposed to have been descended from a daughter of Robert Gib; and we are suddenly startled by the appearance of an Archbishop of Canterbury, said to be the successor of Laud, in the person of a member of this family, Dr. Young, Dean of Winchester. The only authority for this fact, certainly unknown to any previous writer, is that the compiler of these volumes

"in our endeavours to ascertain whether the cathedral church at Winchester contained any monument to Dr. John Young, the present Dean of Winchester (the Very Reverend John Bramston, B.D.) kindly informed us there was none, except his coat of arms on the ceiling, impaled with those of the see of Canterbury, and that he was Archbishop of that province after having been Dean there."

We next come to the history of Sir Henry Gib, called the first baronet of Falkland and Carribber. A person of the name of Henry Gib, of Carribber, does occur in a list of knight-baronets of Scotland, supposed to be by Robert Milne, the Jacobite, which is in the Advocates' Library in Edinburgh. No patent, however, of this baronetcy, we believe, exists, and where Dr. Gibb learned its terms, to be "*to heirs male whatever*" (sic, ii. p. 165), he gives us no means of

judging. The relationship of this Henry Gib to the family of Robert Gib is quite unproved, and the charter of June 29, 1615 (ii. p. 174), by which the message of Carribber was granted to Henry Gibb, and for the first time along with other lands erected into a barony, indicates no relationship whatever to have existed between John Gib of Knock and Henry Gib. It is possible, however, that they may have been related, as Henry Gib was also a member of the king's household, and was groom of the bedchamber to Prince Henry, and after his death, to James VI. It would rather appear that Dr. Gibb has rolled three persons into one, in the person of Henry Gib, whom he persists in calling, of Falkland, in Fife; of Carribber, in Linlithgow; and of Jarro, in Durham; but into this we cannot enter. It is sufficient to point out that the whole subsequent descent of the baronetcy and lands of Falkland and Carribber is imaginary. None of the mythical baronets assumed the title until Dr. Gibb began to put it upon the title-pages of his pamphlets about the year 1867. Not an acre of the lands of Carribber or Falkland belongs, or has belonged for two centuries, to the Gib family. In a list given of the supposed baronets at page 386, of vol. ii., it is said, with a show of candour, that Nos. 4, 5, and 6, the father, grandfather, and great-grandfather of Dr. Gibb, never assumed the title, notwithstanding the continuity of their descent from Sir John Gib, son of Robert Gib, burgess of Linlithgow, who is styled the second baronet. But the fact is, that the title was never taken by this John Gib, called the second baronet, or by his son John, called the third baronet, probably for the best of reasons, because they knew they had no title to it. Dr. Gibb indeed says, at page 252, speaking of the first John Gib,

"he would have no doubt have been aware of the death of his kinsman, Sir Henry Gib, at Falkland, on 8th April, 1650, and if not deterred by the troubles of the times, would have then succeeded to the baronetcy. We have no distinct public proof of this, but all the family evidences point towards it, although he may have refrained from openly using the title until after the return of Charles II. in 1660."

What the family evidences are it is impossible to say, without having had an opportunity of consulting what Dr. Gibb is in the habit of calling "the family archives." The only document which he specifies as belonging to the family, which we presume means himself, is said to be in the handwriting of Thomas, a supposed grandson of the first John Gib, and to be written on the fly-leaf of a volume of sermons published in 1649, which was the property at one time of Sir John himself. This very singular document—which, we trust, still exists for the information of the curious—is supposed to prove the descent of six generations of the Gib family, and to connect Thomas Gib, the great-grandfather of Dr. Gibb, with John Gib, whom he styles the third baronet. It is in the following terms:—

"Robert Gib, of Carribber, had two sons, John and Patrick. Patrick was a burgess of Linlithgow, and left a son, Robert, named after his grandfather. Robert had a twin son and daughter; the son was named after his grand-uncle, John Gib. John was a zealous supporter of the blessed

Covenant; he was at Bothwell Muir in 1670, settled in Cupar, Fife, married late, and had children named John and Christian. His grandson Thomas married Euphem Brydie, of Leven,—July 24, 1744."

Such a document, written in 1744, we need scarcely say is quite insufficient to prove the facts alleged to be stated in it. Sir Henry Gib had, as the charter of 1615, vol. ii. p. 376, shows, a brother, John Gib, to whom and his descendants the baronetcy, if really granted to heirs male whatsoever, would have descended; and it would never have gone while they existed to the family of Robert Gib, the burgess of Linlithgow. Not a single step in the descent of Thomas Gib from the burgess of Linlithgow is truly proved, and yet Dr. Gibb tells us, p. 270,—

"he was unquestionably, according to the highest authorities in London who devote themselves to the consideration of such questions, the fourth baronet of Falkland and Carribber, although he did not continue the title, which he could not legally alienate."

We should like to know who these authorities are, and upon what evidence they based their opinion.

We wonder if the evidence was of the same character as that in the book before us or in the papers of the Breadalbane-Campbell family, which Dr. Gibb informs us "exist to this day in Canada, who are the rightful heirs of the earldom of Breadalbane." These papers, he adds, collected by himself, in three volumes folio in MS., are in the library of the British Museum, vol. i. p. 209, and note. It is unfortunate that no Court exists which can prevent the assumption of titles without a proper proof. This would seem to be a very proper duty for the Heralds Office in England and the Lyon Office in Scotland to discharge. There are a good many baronets, especially in Scotland, with dubious titles; but none of them, so far as we know, has fallen upon Dr. Gibb's device of supporting them by the publication of biographies of imaginary ancestors.

Æ. J. G. MACKAY.

Dahomey as it Is. A Narrative of Eight Months' Residence in that Country. By J. A. Skertchly. (London: Chapman & Hall.)

IN 1871 Mr. Skertchly visited Whydah, in the Bight of Benin, with the view of studying the fauna of the surrounding country. While there, he was induced by the native chief of that town to visit Gelele, the King of Dahomey, at his capital, Abomey, with the view of instructing his sable Majesty in the use of some guns which he had recently purchased. Our author was promised permission to return to Whydah in eight days; on his arrival, however, at Abomey he was detained an unwilling guest of the king for eight months, in order that he might witness and write a description of the Annual Customs then about to be held, the king stating, as his reason for wishing this to be done, that he had hitherto been misrepresented to the English people.

It appears to us that, so far as the Customs are concerned, this simple-minded monarch would have best consulted his reputation

with the British public by sending Mr. Skertchly back to the coast at the expiration of his duties as gunnery instructor, without affording him the opportunities of which he has so well availed himself of describing these Customs. As it is, Mr. Skertchly's book is only another link in the chain of evidence as to the gross barbarity and superstition prevalent among the inland tribes on the west coast, barbarity which we trust the Ashantee Expedition, by greatly increasing the prestige and moral influence of our Government in West Africa, will have afforded the means of checking.

During his stay in Abomey, Mr. Skertchly was permitted to make a trip as far north as the Kong mountains; the king, however, evinced such solicitude for his welfare, and was so anxious to get him back to the capital, to complete his account of the Customs, that he was not permitted to make long halts anywhere, or to pursue his original design of collecting. Owing, too, to the absence of instruments, he was unable to take observations or measure the heights of the hills over which he passed. His journey was therefore performed under circumstances which prevented his taking more than a cursory notice of the country, and a great part of the volume before us is consequently devoted to the description of the "Customs," which are divided into two kinds, the "Grand," and the "Annual;" the former being held only after the death of a sovereign, when his successor has become firmly seated on the throne of his ancestors; and the latter (at which Mr. Skertchly assisted), which take place every autumn.

On these occasions all the chief officials and troops in the kingdom are assembled at the capital, Abomey, the government taxes are collected, all palavers settled, punishments inflicted, honours and rewards conferred, prize money divided, new laws passed, old ones repealed, and all petitions are heard. Mr. Skertchly gives a minute account of the attendant rites on each day during the Customs, which appear to be a happy mixture of dancing, drinking, gun-firing, and murder, no less than sixty-eight human victims, to his personal knowledge, having been sacrificed in 1871, some under circumstances of the greatest barbarity; for instance, here is a description of an execution witnessed by the author on the day of the Attoh Custom:—

"The four men who were nearest the king were then thrown from the platform and decapitated. The first three were not put to any extra torture, but the fourth must have suffered excruciating agony. Four blows were given without severing the vertebral column, the back of the head presenting a fearful sight. The butcher then put the bloody knife into his mouth, and seizing the ears of the wretched being, wrenched the head from side to side in the endeavour to screw it off, and finally, having dislocated the atlas, cut the flesh that still connected the head with the trunk. A more horrible sight I never witnessed."

After the perusal of this our readers will probably agree with us that no endeavours should be spared on the part of our government to put a stop, so far as they are able, to such atrocities.

The victims are selected from captives

taken in war and criminals; the Dahomans believe that the spirits of those sacrificed carry messages to, and swell the ghostly retinues of their departed kings, who, in their spiritual state, are supposed to be the tutelary deities of their country, and who would be offended if neglected. It will, therefore, be understood how difficult a task it is to abolish these human sacrifices, connected as they are with the superstitious religion of the country, by any means short of main force.

The last chapters of this book are devoted to a description of the religious manners and customs of the Dahomans. Mr. Skertchly has no high opinion of the "nigger" in either of these aspects, and, in fact, classes him as a lower animal altogether than the white man; nor does he believe him capable of being improved beyond a certain standard. It is only of late years that the social condition of man in Africa has attracted much notice amongst civilised nations, and we firmly believe that the extension of European civilisation and influence, through the medium of commerce, missions, and the schoolmaster, is working, and will work, vast changes in the religion, manners, and customs of the African, though such changes must necessarily be very gradual: meanwhile we are indebted to observant travellers, like Mr. Skertchly, who, by faithfully and intelligently recording their experiences, enable us to clearly understand the exact nature of these Customs, and thus prepare the way for the solution of the difficult problem as to the best means of checking the revolting barbarities connected therewith.

M. PROTHEROE.

A Plea for Peasant Proprietors. By William Thomas Thornton, C.B. New Edition. (London: Macmillan & Co., 1874.)

FEW living English economic writers had commenced their economic studies when Mr. Thornton's *Plea for Peasant Proprietors* first appeared. The treatment of economic questions by the dogmatic method, with its invariable accompaniments, inaccurate generalisation, and hasty assumption, had been dominant for more than a generation, and Mr. Mill's treatises on *Logic* and the *Principles of Political Economy* had only begun to arouse a questioning spirit. What the amount of investigation of facts was which economists of repute at that period thought requisite, before laying down their propositions, may be judged by the arguments against ownership of the soil by the peasantry which Mr. Thornton found it necessary to combat. Idleness, improvidence, spendthrift and drunken habits, over-population, and widespread pauperism, were assumed to be its inevitable consequences. "The process of division and subdivision," Mr. McCulloch asserted, "will continue until the whole land has been parcelled into patches, and filled with an agricultural population equally destitute of the means and the desire of rising in the world." Of France, in particular, he predicted in 1823, that "in half a century it would certainly be the greatest pauper-warren in Europe, and along with Ireland have the honour of furnishing hewers of wood and drawers of

water for all other countries." The half century has closed with a crucial demonstration that a wide distribution of landed property among its cultivators is not incompatible with great national wealth and financial power, even at the end of a disastrous war. And a recent article in the *Economiste Français* on the population of France enables us to estimate the soundness of Mr. McCulloch's judgment on that point. Between 1831 and 1872, the French population increased only from 32,569,000 to 36,103,000. In the last decade of the foregoing period it actually decreased, chiefly because the small proprietors are deterred by the law of succession from adding to the number of children: "Chacun d'eux voudrait bien garder intact ce qu'il a, et même l'arrondir. Les paysans sont aristocrates." *

The question of the productiveness of small farms is, of course, closely connected with the question of the effects of peasant proprietorship, and Mr. Thornton's first chapter shows that a comparison in that respect between large and small farms is not to the disadvantage of the latter. A yet more instructive comparison is that between the condition of the English and the French peasantry in former times and now, bearing in mind that England, whose present economy in that respect needs no description, was formerly a country with a wide diffusion of landed property and small farms; while in France, on the other hand, the acquisition of land by the peasantry has increased until there are now nearly four million proprietors cultivating their land with their own hands, in addition to the number of owners whose property is farmed by tenants. Mr. Thornton was, we believe, the first economist in England to draw attention to the relative affluence of the English peasantry at a time when small freeholds, copyholds, leaseholds, and cottage farms were numerous, and the labourer had commonly a few acres and some stock of his own in addition to his wages. It will, perhaps, be objected to Mr. Thornton's argument, founded on the sumptuary legislation of 1363, that it takes no account of the great diminution of the population by the plague which began in 1348, and the consequent rise of the wages and expenditure of labourers and servants. Mr. Thornton may, however, reply that the standard prescribed by ordinances and statutes after the Black Death was the old standard, and that the actual scale of wages and living after the plague was much above that prescribed by the King and the Legislature. The Black Death, moreover, will not account for the wealth of the poorest class of the population in the latter half of the next century, as shown by the statutes which Mr. Thornton cites. The advantages of mediæval rural economy, Mr. Thornton might have added, were not confined to one sex. The poor widow in Chaucer's *Nonnes Preestes Tale*, intended as a picture of extreme penury and privation in the humblest rank of the rural population, had three cows, three large sows, a sheep, a cock and seven hens, and her ordinary diet was "milk and brown bread, in which she found no lack,"

with bacon, and sometimes an egg or two. No two events in economic history are more certainly connected than the subsequent consolidation of farms to which Mr. Thornton refers, and the foundation of English pauperism. In 1872 the number of paupers in England and Wales was 1,207,664; and the English agricultural labourer who reaches old age is usually a pauper. In 1862, 1,134,490 French agricultural labourers had, in addition to their wages, small properties in land; and in 1870, on the eve of the war, the number so circumstanced was yet greater, and probably exceeded the above number of paupers in England.

In spite of the political misfortunes of France, the improvement in the condition of its rural population in the present century is the most striking phenomenon in modern history. At the close of the seventeenth century, the peasantry were described by La Bruyère as "human beings that one takes for wild animals, male and female, having nothing human but the form, retiring by night into dens where they live on black bread, roots, and water." Massillon, in the next century, spoke of them as "living in frightful misery, without beds, without furniture, and compelled, in order to pay their taxes, to pluck from their own and their children's mouths the barley and oatmeal bread which is their only nourishment."

Mr. Thornton, on the other hand, can cite the testimony of an English traveller of the present century (Mr. Inglis), who had traversed a great part of the continent on foot, and who wrote without any theory to support: "With a tolerably intimate knowledge of the lower order of France, I am inclined to assert that, upon the whole, the French peasantry are the happiest of any country in Europe." Their happiness and prosperity have steadily increased since Mr. Inglis wrote. In a letter from Avignon, in 1869, to the writer of this article, Mr. Mill, the most scrupulously accurate of writers (as even the most inveterate foe to that great man's memory must admit), said:—

"The condition of the French peasantry has greatly improved, not only since I first knew them fifty years ago, but within the last twenty years. . . . Agricultural wages here are now 3 francs a day, if given all the year round, or 3½ by the day—50 centimes more than ten years ago."

To their wages the majority of French labourers now add the produce of a little property in land. The adversaries of peasant property have dreamt only of one kind of subdivision, the partition of inheritances; they have been in the dark as to the main cause of the increase of small properties—namely, the purchases of the peasantry, the division of *la grande* and *la moyenne propriété* on account of the profit on its sale in small lots, and the gaining ground, in the literal sense, of *la petite propriété*, not its *morcellement*. So far as the French law of succession is concerned, on the pulverising effects of which so much rhetoric has been expended in England, the truth is that it operates mainly as a check to population; and there is reason to believe that the abolition (desirable on other grounds) of the restrictions to the testamentary power would add to the number of children in France.

Mr. Thornton, justly convinced of the baselessness of the notion that peasant proprietorship promotes over-population and consequent subdivision, is of opinion that the number of landed proprietors in France has long remained stationary. He seems to take into account only one class of effects of the purchase of land by the peasantry—that of enlarging or "rounding" small properties, uniting parcels, and counteracting their partition by the law of inheritance. But there is, besides, another consequence of immense moment—namely, the multiplication of peasant properties by purchases on the part of small farmers and labourers. Mr. Thornton (p. 160) conjectures a slip on the part of M. de Lavergne in estimating the total number of rural proprietors at nearly five millions. The *Enquête Décennale* of 1862, however, reckons (in addition to 57,637 proprietors cultivating their land by means of a steward or head labourer) no less than 3,752,120 proprietors who cultivate their lands with their own hands, and who are made up as follows:—1,754,934 cultivators of their own land exclusively; 852,696 tenant-farmers, who also farm land of their own; and 1,134,490 labourers, who cultivate land of their own as well as land of their masters. To the foregoing number of landed properties we must add, first, those cultivated for their owners by the 852,696 tenant farmers already mentioned as having also land of their own; and, secondly, those farmed by 580,060 *fermiers et métayers*, who are described as *non propriétaires*. Notwithstanding the tendency—will any one argue that it is not a beneficial tendency?—of land in France to pass by purchase into the possession of its cultivators, there is of course a considerable number of women, large landowners, people in trade and professions, who own properties which they cannot themselves farm, and which are cultivated by tenants; and, adding these to those enumerated above, M. de Lavergne's computation is probably near the mark. But whatever the total number of landowners in France, the fact of principal importance is the continued increase in the number of peasant properties acquired by purchase—a fact of which the writer has had abundant proof during repeated tours in the country. A passage in the *Enquête Agricole* of 1868 is conclusive on the subject:—

"Ce qu'a perdu la grande propriété, tout ce que perd chaque jour la moyenne, la petite l'absorbe. Non seulement le petit propriétaire arrondit son bien chaque année, mais à côté de lui, la classe des ouvriers agricoles s'est enrichie peu à peu par l'élévation des salaires, et cède à son tour à la propriété: dans la plupart des départements, 75 p. % au moins d'entre eux sont aujourd'hui propriétaires. Dans son ensemble, la petite propriété possède donc une part considérable du sol, et cette part s'accroît sans cesse. On ne peut que se féliciter de ce résultat; c'est à la fois la preuve d'une immense augmentation de bien-être et un gage de sécurité pour la société."

The chief conclusions which result from an inquiry into the movement of landed property in France may be briefly stated as follows: First, that the soil is steadily passing into the possession of its actual cultivators, and that the number of peasant properties, in the true sense, is constantly

* *Economiste Français*, 28 Février, 1874.

on the increase. Secondly, that this is mainly the result, not of an artificial division of properties by the law of succession, but of purchases in the land market, and, therefore, of the natural tendency of things, the interests of both buyers and sellers, and the superior profit of *la petite culture*. Thirdly, that it is a consequence of increasing gains and savings on the part of both small farmers and labourers, on the one hand, enabling them to become buyers of land, and increasing wealth on the part, on the other hand, of other classes, on whose demand for its produce the profitability of *la petite culture* depends. It is needless, therefore, to criticise the writer cited by Mr. Thornton, who concluded that the small landowners of France must be in great distress, because, in the previous ten years, about one-fourth of all the land of the country had been sold.

In Belgium, likewise, the number of small properties has been constantly increasing in the last generation, and the main cause of the increase (although not to the same extent as in France) has been the purchase of land by the peasantry. The following figures are from the latest official returns:—

Number of Proprietors in Belgium.

1845	914,937
1850	953,380
1855	1,003,054
1860	1,050,268
1872	1,113,819

A significant fact of which M. de Laveleye informs the writer, is that in a part of Belgium where large farming prevails, the price of land is falling, tenants are not to be found, and the ground is actually being replanted in wood, because the farmers find themselves unable to pay the advanced rate of wages resulting from the competition of manufactures. In East and West Flanders, on the contrary, where the small farmer and his family do almost all the work, the labour difficulty does not exist, and rents and the price of land are steadily rising; though by nature the Flemish soil is a sandbank, kept fertile only by the most liberal and incessant outlay of both labour and manure. It is impossible to predict the future of farming, but those landowners in England who think small farming incompatible with the progress of mechanical art may do well to consider the possible influence on the question of the rise of agricultural wages. Another circumstance worthy of notice is that notwithstanding the decline in Flanders of spinning and weaving by hand, which formerly contributed much to the support of the peasantry, they are now decidedly better off than when they had that subsidiary resource.

"Taking a walk last summer," says Mr. Thornton, "in the neighbourhood of Ypres, with a well-known Belgian economist, I inquired how pauperism is provided for in his commune. 'There is none,' was the reply, 'either here or in any of the purely rural communes. Nowhere in Flanders, outside of the great towns, will you see a beggar holding out his hand.'"

Mr. Thornton's induction ranges over many other countries besides those referred to in this article, and results in a chain of evidence on the side of the diffusion of landed property among the peasantry—

looking to its moral, social, and political, as well as to its economic effects—in which its opponents will not easily find a frail link. Yet he by no means falls down and worships the peasant proprietor; on the contrary, he was formerly disposed to be rather hypercritical of his manners. One is glad to see that he now finds reason to recant in a note, p. 184, some remarks in a paragraph reproduced in the text from his first edition, on the insufficiency of education to civilise the German peasant, and the necessity of a gradation of ranks for that end. Speaking of Germany, one may justly ask, where in England, or under what system of large farming, can irrigation comparable to that of the peasant proprietors of Siegerland, or of the valley of the Lenne, be found?

Mr. Thornton appropriately dedicates the new edition of his *Plea for Peasant Proprietors* to M. Léonce de Lavegney and M. Emile de Laveleye, "pre-eminent among living writers on rural economy." The reputation of both in France is well known in England; it may, perhaps, not be so well known that in Germany, too, one of the most honoured names in the roll of living European economists is that of Léonce de Lavegney.

T. E. CLIFFE LESLIE.

Die Shakespearomanie. Zur Abwehr. Von Dr. Roderich Benedix. (Stuttgart: J. G. Cotta, 1873.)

At one time it required no inconsiderable amount of courage on the part of a German writer to speak with anything but unqualified praise of Shakespeare. Such courage was exhibited fifty years ago by the poet Grabbe, when he wrote his treatise *Ueber die Shakespearomanie*; and again in recent times by Rümelin, when he ventured to publish his *Shakespeare-Studien*. These works have, therefore, a certain charm for their readers, not very unlike the attraction which Lessing may have found in the writings of the heretics of the Middle Ages. Since the publication of Rümelin's *Studien* the number of German Shakespearean heretics has been considerably increased, and although they are, and will probably continue to all eternity to be in the minority, they have nevertheless gained courage year by year, and have already assumed an attitude of defiance well calculated to inspire consternation in the ranks of the champions of Shakespeare.

The work which heads this article proclaims that the lately deceased Dr. Roderich Benedix had gone over to the side of these dissenters. This prolific and highly gifted writer has thus closed the long career which he had devoted to the drama, by making a critical analysis of the man who ranks as the greatest of all dramatic poets. Benedix did not live to see the whole of his work through the press, and hence, as the editor tells us, "it must be accepted as the author's legacy to the German nation."

The merits of Benedix as a dramatic poet had been so thoroughly gauged during his lifetime, that in the present case there seemed no difficulty in predicting his character as a critic. Even before we had seen the work, we had formed a tolerably definite idea of its contents. We did not expect to find any

depth of learning, or any special subtlety of apprehension, but we looked for the manifestation of those sound and correct powers of observation which so specially appertain to him as a dramatic writer, and we had hoped to meet with various apt remarks on the individualities of Shakespeare's plays, such as might be expected to suggest themselves to a keen observer conversant with the stage. Considering that the title of the book proclaims its antagonistic character, we could not, of course, look for entire impartiality from the critic, but we assuredly did expect to meet with a genuine effort to be just. In short, from such a genial writer we anticipated receiving a genial book.

It would be useless to deny that we have found ourselves to a certain extent disappointed in this expectation, and we hope in the following remarks to enable our readers to judge for themselves how far we are justified in our disappointment.

The author has given his book the form of a dramatic dialogue, in which the speakers are three friends, "young men who have devoted themselves to science," and whose names are Helmuth, Reinhold, and Oswald. The chief speaker is Helmuth, who reads the various plays in order to criticise them in a series of interviews with his friends. In these discussions he derives most support from Reinhold, who possesses more knowledge and a more mature judgment than either of his friends, and has long since formed an opinion of his own with regard to Shakespeare. Reinhold, moreover, supplies Helmuth with aesthetical suggestions, supports his arguments, and otherwise upholds him. Both represent the point of view assumed by the author, which is one of the most decided antagonism to the German Shakespeare-worship. Oswald, on the other hand, proclaims himself an enthusiastic admirer of the great Englishman. The part which Benedix makes Oswald play shows us, however, from the first that we are not to expect the smallest degree of impartiality from him. Oswald pins his faith to the words and opinions of the learned aestheticists who founded the Shakespeare-creed, and he brings forward certain phrases that he has caught up from their writings, but is incapable of forming an independent opinion, and is utterly routed at the first assault. Even when he has right on his side he is unable to maintain it, and allows himself to be brought to silence. Did Benedix really suppose that he could put down his opponents with the weapons used with such signal success by Helmuth and Reinhold against Oswald?

The plays are discussed in the order in which they appear in "the celebrated translation of Schlegel and Tieck," an unmethodical system which is of itself calculated to excite suspicion. And what is still worse is that Benedix, who uses the German version, never at any passage refers to the original, which he does not appear to have studied. Yet notwithstanding this he does not hesitate to pull to pieces sentence after sentence, and sharply to criticise Shakespeare's diction and metaphors, without pausing to consider whether his criticism applies to the poet or to his translator, or whether a misconception on the part of the latter, or a false reading, may not have ob-

scoured the author's meaning. Extraordinary as this mode of criticism is, the manner in which he tries to justify it is still more remarkable.

Helmuth has brought forward a passage in *Richard II.* as an example of an unnatural, over-strained mode of speaking, on which Oswald says: "It certainly does appear somewhat involved. But then you must consider that this is only a translation. He may perhaps be much more simple in the original."

"REINHOLD. That argument is untenable. Is not the rallying cry of the Shakespeare-maniacs: We exult in having won Shakespeare for ourselves? That is to say, he has become our own by translation, and consequently we are bound to accept our translation as if it were an original." (P. 106.)

After this specimen of the remarkable logic employed by Benedix, the reader may very possibly suppose that the book has been written rather for the sake of amusement than instruction, and that the whole thing must be accepted as a joke. Nothing could, however, be further from the truth, for Benedix is in sober earnest, and where he intends to be facetious he is careful not to leave his readers in doubt as to his intentions, but it must be confessed that the jocose passages of the work are, on the whole, less provocative of mirth than many of the things which he says in earnest.

Although Shakespeare's plays are more or less thoroughly analysed, very few have gained favour in the sight of the critic, excepting *Macbeth*, *Romeo and Juliet*, *King Lear*, and *Midsummer Night's Dream*, and even these are not dismissed without a certain share of animadversion. In almost every play Benedix sees occasion to object to the composition; everywhere he detects a bombastic style, and very frequently he condemns the morality of the drama. Sometimes even—although it seems incredible—he accuses Shakespeare of psychological misconceptions, as the following quotation from Reinhold's speech on the character of Romeo will show (p. 212):—

"REINHOLD. I find great want of harmony in this representation of Romeo's character. What has always struck me very unfavourably is that on his first appearance he is romantically in love with Rosalind. We are called upon in this play to take a vivid interest in the passion of two young lovers. Their love should, therefore, be the first that either has felt. Juliet brings Romeo her first love, why should not he do the same to her? He is made by the very absence of this to occupy an inferior position to Juliet. First love is virginal, and in it is enshrined the delicate charm that calls forth our sympathy. Why does the poet rob Romeo of this charm? Even if he had loved before, why should we know it? Yet the poet brings him before us firmly bound in the chains of love. From this springs a double disadvantage. By his desertion of Rosalind for Juliet, Romeo is guilty of wrong to the former; and, after such conduct, what guarantee can Juliet have of his fidelity? I am unable to comprehend the meaning of Romeo's first love! It throws a doubtful light upon his character, and is not of the slightest significance in regard to the plot. It strikes me as a psychological impossibility. Romeo loves Juliet at first sight. A sudden love like this is beautiful and poetic, but it is only possible where the heart is free. Romeo, however, is not free; he is ensnared by another love, which is moreover unhappy, and, therefore, one that would take a doubly firm hold of his heart. I regard it

as psychologically impossible that any one could suddenly pass from such love as this into another passion!"

These sentiments, no doubt, do honour to Benedix's heart, but they show that he knew less of lovers in the actual world than of lovers on the stage, and that he was unable to discriminate between the excitement arising from a mere craving for love, and which, after the manner of Jephtha's vow, seizes upon the first object that comes in its way, and that true love which is born of the mutual affinities of two beings. The unhappy—or in other words unrequited—love, which according to Benedix is one that would have taken a doubly firm hold of his heart, is according to Shakespeare's theory mere imagination, an object for comedy, but not for tragedy. (Compare *Midsummer Night's Dream* in its relation to Chaucer's *Knight's Tale*.) There can be no doubt that Shakespeare is less sentimental on this point than Benedix, while it is equally clear that his view is the more ideal of the two. Benedix on one occasion expresses extreme surprise that the admirers of Shakespeare should extol him as at once the most imaginative and the most realistic of poets. And this fact alone might have shown him that his own powers of apprehension fall short of those of the writer, whose ideality and realism he is unable to follow.

We can now easily understand why Schiller should strike the author as being so much more sympathetic than Shakespeare, and why his anger should be roused against those harsh critics who in somewhat too severe terms, perhaps, have characterised Max and Thekla as "Flower-Souls," for "Max and Thekla, indeed, are loving beings, both in the book and on the boards." The following passage extracted from Reinhold's address (p. 213) is nearly as characteristic as the above:—

"REINHOLD. From the moment Romeo loves Juliet, his behaviour is represented to perfection. He is ardent, daring, tender, and goes resolutely towards the goal he has in view. Even when he gets involved in strife, he is moderate, and considerate, and tries to make peace. When he can no longer escape hostilities, he behaves like a gallant knight. But when he is banished his conduct is childish, he laments, gives way to senseless fury, and throws himself on the ground like some uncontrolled ill-mannered boy. Not a trace of knightly bearing is to be seen in the youth!"

Here Benedix reminds us of Voltaire; but we will continue our quotation.

"OSWALD. What a harsh judgment!"

"REINHOLD. It is not mine, but Shakespeare's own; does he not say:

'Art thou a man? Thy form cries out thou art.
Thy tears are womanish; thy wild acts denote
The unreasonable fury of a beast;
Unseemly woman in a seeming man;
Or ill-beseeeming beast in seeming both!'

Which then do you prefer, my opinion, or these words in which the poet has himself described Romeo's conduct?"

Here Benedix reminds us of Fielding's Partridge, who withheld his admiration from Garrick because the actor was too much in earnest when he acted. Benedix in the same spirit, when impressed with the creative faculty of the poet, blames Shakespeare for what belongs in fact to Romeo.

Something similar to this is even more

strongly marked in Benedix's criticism on Shylock, which is one of the most interesting passages in the book, and we much regret that want of space will prevent our giving it. Benedix takes Shylock's part against Shakespeare: not in this case because the poet has made the character too evil, but because he has undeservedly made him unhappy. Here, therefore, we have a charge of a moral, and not merely a psychological misconception, on the part of the poet. The sentiment which underlies the blame expressed by Benedix is in this case as just as his judgment upon it is unjust. In many of Shakespeare's comedies the spectator is left at the close with a mixed feeling, very foreign to a condition of entire satisfaction. Whence comes this? Simply from this: that the solution of the more earnest complications of a comedy can very often only be attained by a sort of abstraction of feeling. This is illustrated in the case of the deceived and ill-used fathers and uncles of French comedy, in regard to whom we abstain from thinking of the moral ideas which they represent in the world. Shakespeare, as a rule, renders this kind of mental abstraction impossible to the spectator, because he was himself incapable of sustaining it, and because he has even made the characters which, in accordance with the general intention of the plot, are to excite our mirth, life-like and human, and has brought them so near to us that we are constrained to feel with them.*

Taken as a whole, the *Shakespeareomanie* of Benedix must be characterised as a patriotic well-intentioned work, but the author lacked the mental culture and unprejudiced judgment requisite to comprehend the genius of Shakespeare. In regard to Shakespeare himself, the book teaches us only as much as any effect is capable of teaching in regard to the cause from which it springs. The task which Benedix sets himself, and which was no less than to trample down the growth of German Shakespeare-worship had, however, been attempted before him by Rümelin with much greater success and in a more dignified manner.

We would not, however, condemn the present work as utterly useless. On the contrary, it seems to us both instructive and entertaining. It is instructive, first, because it teaches us that one may attain decided success as a dramatist and yet be a poor psychologist; secondly, because it makes us acquainted with Benedix's dramatic theories, and gives us in relation to questions of the drama many practical hints, which are most acceptable coming as they do from so experienced a dramatic poet; thirdly, because it proves how extremely meagre and unsatisfactory is the condition of aesthetic culture generally, amongst the majority of the educated German public, and how slight is their acquaintance with Shakespeare specially. That the latter reproach should still be applicable is in part due to those German aestheticians who have made Shakespeare the subject of their special commendation. The promoters of the Shakespeare-mania in Germany are themselves responsible for

* Rümelin has made some good remarks on Shylock in his *Shakespeare-Studien*.

the appearance of such a work as the *Shakespearomanie* of Benedix. We shall hope, however, to enter more fully into this question in a future article, in which we propose to bring to the notice of our readers the second edition of *Kreyssig's Lectures*.
BERNHARD TEN BRINK.

Facetiae. In Two Volumes. (London: J. Camden Hotten.)

THIS publication is peculiar in its form and matter. The first volume contains two distinct books—*Musarum Deliciae*, or the *Muses' Recreation*, "containing several pieces of poetic wit," by Sir John Mennis and Dr. James Smith, published in 1656; and *Wit Restored* "in several select poems," among which are some by the same authors, published in 1658. These collections comprise specimens of the most stupid, and (it is to be hoped) the very dirtiest rhymes in the language. The reader has not gone through six pages before he is presented with a "recreation" sufficient to turn the strongest stomach. We have often heard of a tenth Muse. To the authors of the *Journey to Epsom*, and other pieces here given, the tenth Muse was probably Cloacina—to whom this volume would be an appropriate, if rather costly offering. There is no excuse for this attempt to preserve the literary excreta of bygone generations, "beautifully printed on antique laid paper, and bound in antique boards." We know well enough without such illustrations what was the habit of mind at once repressed and fostered by the Puritan rule, and what were the orgies of the Restoration. Historical study cannot profit by the reproduction of these base-nesses. A curious fact might be noted, a fanciful copy of verses might be preserved without defiling our bookshelves by the nastiness which here accompanies it. It is not a question of prudery or squeamishness. No one need be ashamed of reading Swift and Sterne, coarse and prurient though they be; but the grossness of *Musarum Deliciae* is insufferable, being not the vehicle but the substitute for wit. The padding necessary to fill the volume is supplied by all kinds of scraps, an old ballad or two, far-fetched conceits, and wire-drawn love poems. In two instances the popular sympathy with Felton, the murderer of Buckingham, finds expression. He is bidden to let his prison know he has a liberty it cannot bind, since—

"Nothing but guilt shackles the conscience."

When he is hung in chains, the prediction is that—

"His flesh (which oft the charitable skies
Embalma with tears, doing those obsequies
Belong to men) shall last till pitying fowl
Content to reach his body to his soul."

In the reprint of one of Milton's Hobson Epitaphs occurs a various reading:—

"Dogg'd him 'twixt Cambridge and the London Bull."

The second volume (but the first in order of time), *Wit's Recreations*, is of a different character. It was originally published in 1640. It contains epigrams, under which rank a few short extracts from the dramatists, and a collection of epitaphs, very few of which equal that "On a Child:—"

"Here she lies, a pretty bud
Lately made of flesh and blood;
Who as soon fell fast asleep
As her little eyes did peep;
Give her strewings, but not stir
The earth that lightly covers her."

Milton's early poems were not yet published, but here are epitaphs on Hobson as good (or bad) as his. Then follow anagrams, and a selection from the poets in vogue, Ben Jonson, Suckling, Waller, &c., George Herbert's *Outlandish Proverbs*—no rarity surely—is tacked to the end of the book. In *Wit's Recreations* we have a broad joke or a coarse allusion now and again, but it is unobjectionable as compared with the companion volume. It is, however, a worthless compilation. The best things in it are well-known, and much of the remainder is not worth knowing. Indeed, the editor of the reprint of 1817 (of which the present publication is mainly a copy) is fain to admit that of these works their titles are the best part. His preface is unpleasantly suggestive, attributing to the grave collectors, "for whom the publication is almost exclusively intended," an "infinite complacency" in "impurities in an old book." He gives memoirs of the insignificant lives of Sir John Mennis (or Minnes, as Pepys calls him) and Dr. James Smith. The former was one of those naval officers who, on the revolt of the fleet, refused to obey the Parliamentary admiral, the Earl of Warwick. He commanded a ship in the small royalist squadron under Rupert, and at the Restoration was made Governor of Dover Castle and Chief Controller of the Navy. He accompanied Lord Sandwich to Tangier, and (in 1662) to Lisbon, whence he escorted Catharine of Braganza to England. He died in 1670, and is buried in St. Olave's, Hart Street, the church once attended by Pepys, whose wife's effigy still cranes its neck over the nave.

In the *Diary* Minnes is usually referred to in terms of contempt or abuse, but on one occasion Pepys admits him to a share in the consideration with which "we, and my Lord Brouncker" ought to be regarded, and expresses his surprise that "before such persons" a mere member of Parliament should venture to quote *Hudibras*, "as being the book I doubt he hath read most." Dr. James Smith was the chaplain of Lord Holland, admiral of the expedition to Rhé. He was "much in esteem with the poets of that time, particularly with Massinger, who called him his son, Will D'Avenant, Sir John Minnes, &c." After the Restoration he was made Canon of Exeter, and chaplain to Clarendon. In 1661 he took the degree of D.D., and two years afterwards he was rector of Alphington, Devon. He then surrendered his living of King's Nympton, in which he had remained during all changes of government with the pertinacity of the Vicar of Bray. To the wonder of Mr. Dubois, the editor of 1817, Dr. Smith is unnoticed by his literary contemporaries, and, "what is still more surprising, his works are omitted from a catalogue of the most vendible books in England, printed at London in 1658;" but "at the Restoration his Muse could breathe freely in an atmosphere perfectly congenial to her." The crowning marvel ought to have been that "so he got preferment," but the world, then as always, knew its own.

To this pair of friends, Sir Priest and Sir Knight, we owe some of the nastiest pages in the first volume of these dreary *Facetiae*. To republish them seems an offence not only to the living, but against the dead—a wanton exhibition of their mouldering relics. The charitable asylum of oblivion should not be thus needlessly and unprofitably violated. If they wrote many a line that, dying, they might wish to blot, it is an indecency to recover for custody "in the cabinets of the curious," things neither sweet nor rare—for this sort of wit is surely the paltriest and easiest, "in which everybody can join," as Walpole said. Of these poor poetasters we know little more than that they perpetrated these offences, though in their lifetime they had doubtless friends whose good-will rested on a better foundation than mere fellowship of swinish moods. If their worst words have so far outlasted the remembrance of their best deeds, why should anybody be eager to renew the record? Surely, since their virtues are forgotten, it is cruel to allow their vices longer memory. It were nobler to let

"Their ignomy sleep with them in the grave,
But not remember'd in their epitaph."

R. C. BROWNE.

Memoir of Thomas, First Lord Denman, formerly Lord Chief Justice of England. By Sir Joseph Arnould, late Judge at the High Court of Bombay. In Two Volumes. (London: Longmans & Co., 1874.)

THE public events in which Lord Denman took part have invested him with a celebrity which entitles him to something more than a niche among Lives of the Judges or Chief Justices. And besides the professional and political importance attaching to a man's career, the probability of its being entertaining or interesting to the public on other grounds is always to be taken into account. And for both reasons we should say Sir Joseph Arnould was quite justified in undertaking the Life of Lord Denman. Its social interest is certainly its chief attraction. But still four such important public cases as those of Queen Caroline, Daniel O'Connell, Stockdale v. Hansard, and the Hampden Appeal, in all of which Denman played a leading part, give it a solid claim on the attention of lawyers and statesmen greater perhaps than Lord Denman's own abilities, apart from these associations, might have been able to secure for it.

We do not blame Sir Joseph Arnould, as some of our contemporaries have done, for allotting so much space to Denman's youth and early manhood. To us his school and college days, and his early life at the bar, seem particularly interesting. He was a typical specimen of the class of young Englishmen from whom, in those days perhaps more exclusively than in these, the bar was recruited. His family was just on the border line between the upper and the middle class, belonging to the former by extraction, and to the latter by position. His remote ancestors were country gentlemen; his great-grandfather was a yeoman; his grandfather was a country practitioner; and his father was a London accoucheur. He himself was educated at Eton and Cam-

bridge, and free, therefore, of that large portion of society in which these distinctions constitute a species of freemasonry. His mother was a Miss Brodie, and aunt of the celebrated surgeon; and both parents belonged to that class of enthusiasts who believed in the perfectibility of human nature by means of education alone. In their choice of a university, however, they did not display much wisdom. Denman detested mathematics, and thought them useless as a training for the practical business of life. And it is curious that this opinion of the one Chief Justice should have been made public almost simultaneously with the declaration of another to the effect that mathematics are the finest discipline in the world. What Denman would have thought of logic, and whether he would have differed from Sir Alexander Cockburn on that point too, we cannot tell, for logic in those days formed no part of the Cambridge course. But we may take the opportunity of observing that logic and Euclid are not, as some people seem to imagine, distinct and rival modes of reasoning, but essentially the same. There can be no sound reasoning which is not logical; and the Fifth Proposition is only a series of syllogisms. Denman, though a good scholar, seems to have preferred English composition to Latin, and has left behind many specimens of his skill in English versification, though none that we know of in either of the classical languages. His English verses are fair average specimens of the eighteenth century style. His taste, however, in English literature was not, perhaps, of the purest; and we hardly know which to admire more, his opinion of Miss Austen's *Emma*, or Sir Joseph Arnould's apology for it. Denman calls it "a very silly book." And Sir Joseph says, "The defender of Brandreth [a prisoner charged with high treason] was hardly likely to take much interest in the irrepressible gossip of Miss Bates, or the imaginary ailments of Mr. Woolhouse." Why not? If he was capable of appreciating the delicacy of Miss Austen's humour, his hard work in court would only have lent additional zest to it. On the whole, there is no evidence in these volumes of much real literary ability in the late Lord Denman. He had enough literary knowledge—and we may be sure he made the most of what he had—to hold his own in the literary society of the day, and he could turn out a very creditable article for the *Edinburgh Review* on subjects which he understood. But he was not one of that small class of lawyers who are remembered by their literature nearly as much as by their law.

Denman's long vacations were spent in a way which has since become highly fashionable—namely, in walking tours, which carried him through a good part of Wales, Derbyshire, and the West of England. His pedestrian tastes he continued to gratify in term time, and was fond of walking fifteen or twenty miles between lectures and dinner with a few chosen companions, beguiling the time by capping verses. This was a very uncommon taste, at all events at Oxford, only twenty years ago. But the few university men who were addicted to it, and

read these lines, will remember, perhaps with as much pleasure as the present writer, their long rambles over the woody hills which rise up from the Cherwell and the Isis, by "Bablock Hythe" and by the "Fyfield elm," scenes rendered classic for ever by the memory of the "scholar gipsy." Those were happy days, and Denman, we should say, was exactly the kind of man to enjoy them, with the cosy dinner afterwards, and the bottle of port and rubber of whist which succeeded it. That Denman was a very hard student at this time there seems reason to doubt. He lived habitually with the best scholars of his year, Shadwell, Hodgson, Merivale, Bland, &c.; but he did not get enough mathematics to obtain even the rank of junior optime, without which nobody at that time was allowed to try for classical honours. And there is nothing to show that he cared very greatly for the latter. University prizes and university scholarships were open to him; but if he ever aspired to such laurels his biographer has not told us of it. He evidently intended to go in for classics, had he been successful in obtaining the mathematical qualifications; but it seems to have been rather to please his father than himself, as it was his father, and not himself, who was most disappointed at his failure. In the year 1800 he took an ordinary degree, and hurried up to Lincoln's Inn to commence the study of the law. His early days, both as a student, a special pleader, and a barrister, were spent much after the immemorial fashion of the Templars. He was a constant patron of the theatres. With his old college friends he formed whist clubs and dining clubs; and the taverns of Fleet Street, the Strand, and Covent Garden, doubtless, had plenty of his company. Denman was always more or less a man of pleasure, and was totally unable to imitate the primitive frugality of his father, who, on one occasion when asked to take bacon at breakfast, replied that he had already had an egg, and that "one luxury was sufficient." At the same time he was not at all ahead of his age in point of fastidiousness or costly living; he merely liked to enjoy himself. But his ideas were quite those of that "homelier and happier time," as Sir Joseph Arnould well calls it, when ladies and gentlemen found it possible to exist without any of the trappings of fashionable life about them. At the appropriate age of five and twenty Denman, of course, fell in love, the lady being the eldest daughter of a Leicestershire clergyman, the Rev. Richard Ververs, of Saxby, near Melton, and sister of one of his college friends. She was very pretty, accomplished as accomplishments then stood, and rode well to hounds; her father being one of the old school, a man of birth and a sportsman as well as a good parish priest. Their passion brooked no delay. Three months from their first introduction to each other they became man and wife, being married at Saxby church on October 18, 1804. The bridegroom of course had no money; nor does it appear that the bride had any portion. But his father consented to allow them 400*l.* a year, and with that, and some professional earnings, two people could live pretty comfortably seventy years ago.

The next twelve years of Denman's life present nothing remarkable. He joined the Midland Circuit, and entered with zest into all the fun of the mess. Briefs seem at first to have come in but very slowly. But his manners and disposition made him a general favourite, and it seems probable that in Derbyshire and Nottinghamshire he had some local interest. His uncle, Dr. Joseph Denman—who, when his father went up to town, stayed behind in the country and kept on the medical practice—had become a fashionable country doctor, and a frequent guest at Chatsworth, and through this channel Denman may have been commended to the notice of solicitors, especially those of Whig politics. On this head Sir Joseph Arnould is silent. But, at all events, in 1816 Denman was retained for the defence of the Luddite prisoners, a body of peasants and mechanics who had broken out into open insurrection under a leader named Brandreth, and by his conduct of the case raised himself at once into the front rank of his profession. How in quick succession after this he was brought into Parliament by a Whig peer, retained for the defence of Queen Caroline, appointed her Solicitor-General, and finally associated with Brougham in his great Parliamentary labours, is related by Sir Joseph Arnould with spirit and impartiality, and to him accordingly we refer our readers for the facts. His biographer admits that he was not a success in the House of Commons; and, indeed, at the next general election it was intimated to him that the borough of Wareham would no longer be placed at his disposal. But he acquitted himself with great credit on the Queen's trial, and we are told by Sir Joseph Arnould that his speeches at the time were preferred by the public to Lord Brougham's. He made one or two mistakes, no doubt; as, for instance, where he inadvertently likened his client to the woman taken in adultery, and also by applying to George IV. a very odious classical anecdote picked out for him by the chaste Dr. Parr. For this offence the King hardly ever forgave him, and it was not till 1828 that he was able, at the Duke of Wellington's intercession, to obtain a silk gown, though he had then been called to the bar two and twenty years. In 1820 he was returned for Nottingham, and retained his seat till 1826, when he declined to contest it again on the score of expense; but he was restored to his constituents in 1830, and in the year following became Lord Grey's Attorney-General, which gave him a claim to the Lord Chief Justiceship as soon as it became vacant. Ten years before he had been appointed to the office of Common Serjeant, then worth from twelve to fifteen hundred a year; and this, of course, when he became Attorney-General, he was obliged to resign. We have spoken of Denman's luck. He entered Parliament, as his biographer points out, at a very lucky moment, when the number of Whig lawyers in it had been much reduced; and Lord Tenterden, Lord Chief Justice from 1818 to 1832, certainly died at a very lucky moment for him. For William IV., whom he had offended at the Queen's trial almost as deeply as his brother, though he had so far forgiven him as to allow his being made Attorney-General, wanted to

make Lyndhurst Lord Chief Justice; and, had Tenterden lived two years longer, most probably would have done so. However, fortune still showed herself constant, and carried off Charles Abbott on November 3, 1832, who, having contrived to articulate the words, "Gentlemen, you are all dismissed," expired himself a moment afterwards.

In the opinion of the profession, Denman was greater on the bench than ever he had been at the bar, as he was greater in the House of Lords than ever he had been in the Commons. He is thought to have been one of the best criminal judges who ever tried a prisoner; and we could wish that Sir Joseph Arnould had given us more illustrations of his powers in this respect. Lord Denman always set his face strongly against the abolition of transportation, having a very strong opinion of its deterrent influence; and his biographer relates very well what an effect he produced upon two criminals at Chelmsford, who had at first received a sentence of fourteen years' transportation with apparent indifference:—

"After a slight pause, looking fixedly at them, and raising his majestic voice to its full compass, 'And do you think that a light sentence? So far from it, that I have seen old and hardened offenders—men who, having been sentenced to transportation before, well know what transportation is, I have seen those men sink fainting in the dock before me when it has been my duty to pronounce, upon them that dreadful doom.' The effect was electric; the two human brutes in the dock trembled and grew blanched with terror; and many a yet undeveloped member of the criminal classes in the crowded Court—many a one 'who, if not yet criminal, might be contemplating crime,' and who had often, perhaps, talked jestingly of a 'trip to Botany Bay,' stood horror-struck at the dreadful nature of a sentence which the law had made second only to death itself; and which, in those days of Norfolk Island, involved sufferings and infamies from which even death itself would have been a release."

In the trial of Queen Caroline there is no doubt that Denman's judgment was biased by political feeling, as well as by a misplaced sentiment of chivalry, to which Brougham, who knew a great deal more about her than his colleague, was a total stranger. In the case of *Stockdale v. Hansard* the result seems to prove that he was right, for the House of Commons did finally establish by statute the privilege which Denman had maintained that they could not create by resolution; the privilege being the immunity of the printer from an action for libel, who should make an affidavit that the defamatory matter complained of had been printed by command of the House. Of the *O'Connell* case Sir Joseph Arnould remarks: "No one in the profession of the law now doubts that on both points the judgment of the majority of the law lords was right." He has doubtless authority for saying so. But even assuming that it is so, there are two senses of the word right; and we should be rather disposed to say that Lords Denman, Cottenham, and Campbell took advantage of a technical fiction which was perfectly well understood, and had hitherto passed unquestioned, to overthrow a verdict which everybody felt to be just. This remark applies only to one of the two grounds on which the sentence was reversed; the contention, namely, that a

general verdict of guilty could not be sustained unless each particular count in the indictment was without flaw. It had hitherto been held that one good count was sufficient to pass all the rest, since the remainder, though apparently charging separate offences, were perfectly well understood to be only repetitions of the same. The three law lords now demanded that all should be construed literally; and though the letter of the law seems to have been on their side, yet we cannot persuade ourselves that the sudden devotion to it evinced by the noble and learned lords in question was wholly justifiable or disinterested. The other objection taken by the counsel for the traversers to the composition of the jury, which they alleged to have been improperly selected, was less technical, and in allowing the force of it, we should think Lord Denman was right, and it is only fair to add that his own judgment was mainly founded upon this. In the *Hampden* case the main question at issue was, whether the act of the archbishop in confirming the appointment of a bishop was ministerial or judicial. Dr. Lushington and Sir John Dodson advised the Vicar-general that it must be held to be the former only; and the point being referred to the Court of Queen's Bench, their lordships were divided in opinion, Denman and Erle taking the same view as Dodson and Lushington, while Patteson and Coleridge held the act to be judicial. The former accordingly went forth as the judgment of the Court; but one can express no opinion on its merits without having the arguments of the dissentient judges before us; and we may here say, generally, that Sir Joseph Arnould would have made his book more useful if he had more often given us a full account of the argument to which Denman's judgments were opposed.

Lord Denman retired from the bench in February 1850, and died four years and a half afterwards, in September 1854, in the 76th year of his age. In the interval he lost his wife, who died, to his great grief, in June 1852; and three months afterwards his old friend the Duke of Wellington followed her to the grave. On the Duke's death, Lord Denman wrote the following lines, which, as we consider them extremely good, and as they will probably be new to the majority of our readers, we here subjoin:—

"In youth, in age, in peace and war the same,
With many tasks, but still one only aim,
For England's weal with single heart he stood,
Best of the great, and greatest of the good."

These have the true Popian ring about them, and are, to our thinking, by far the best verses Lord Denman ever wrote. Two years afterwards he expired in the arms of his family, and was buried in Stoke Albany churchyard, where a tombstone is erected to the memory of "the great and good Lord Denman."
T. E. KEBBEL.

SIGNOR CARLO MORBIO is preparing for the press, under the title of *Alessandro Manzoni i suoi Autografi*, a biography of the poet, based upon original documents, which will be of special value and interest, as hitherto the obscurity with which Manzoni loved to surround himself, even at the height of his success, has rendered the publication of an adequate biography all but impossible.

Out of Court. By Mrs. Cashel Hoey. (London: Hurst & Blackett, 1874.)

No Alternative. By Annie Thomas (Mrs. Pender Cudlip). (London: Chapman & Hall, 1874.)

Annals of the Twenty-Ninth Century. (London: S. Tinsley, 1874.)

Chaste as Ice, Pure as Snow. By Mrs. Despard. (London: S. Tinsley, 1874.)

MRS. CASHEL HOEY'S new story, *Out of Court*, is full of delightful surprises. The motto, "The Gospel checks the law which throws the stone," prepares the reader for a new discussion of the charming question which M. Dumas *filis* has treated so often and so ably. Mrs. Hoey's solution is original and amiable. She does not say "Slay her," but "Marry her over again by special licence." This is a surprise in itself, but the introduction of the pleasing theme, just when the reader is beginning to despair, and his attention to flag, is very skillfully managed. He is on the point of thinking that the motto has misled him, and that he has been beguiled into studying a mere sketch of ordinary characters cleverly drawn. For they are cleverly drawn: Blanche is as pretty, and featherheaded, and obdurate almost as Rosamond Vincny; Marcus, her husband, who quotes Byron to her in Switzerland, and finds that the House of Commons "gives him larger ideas of men and things," is Mr. Tennyson's blameless King translated into modern prose; and Mrs. MacMahon is a careful and elaborate sketch of the female campaigner. Still this is not the kind of thing that people read novels for, and if he were not impelled by curiosity to find out Lord Frampton's secret, and what the Being was that lived behind the iron door, the student would probably throw the volumes aside. Let him persevere; the lights are lowered, a lurid gleam is cast on the figure of the seducer; concealed behind the velvet curtain with Marcia (secretly in love with Marcus), we behold Blanche hesitate, and know that she is lost. It is a dramatic scene in which she flees from home, while her innocent lord is posting his parliamentary correspondence in the adjacent pillar letter-box. After this the agony deepens; the harmless necessary detective is made sparing use of; Lord Frampton's secret, a very horrible one, is divulged; and complete poetic justice is dealt to Mrs. MacMahon. Through all this portion of the tale Mrs. Cashel Hoey, like Scott in the description of Flodden, "never stoops her wing." Perhaps the third volume is a little weakened by the pious but lengthy speeches of Marcia on the laws of Divorce. Very prosaic readers may quarrel with the finish, but the more imaginative will feel sure that poor Blanche, after being "very much married," once in the ordinary way, once—illegally—to her seducer, and again—by special licence on board a yacht—to her original husband, really died in Algeria, and left Marcus free to reward the constancy of Marcia. A hint is given that Marcia afterwards "deserted the errors of the Church of England for those of the Church of Rome," and we trust that some day Mrs. Cashel Hoey may favour the world with the interesting particulars of this conversion. Some of the persons and

situations in the novel are conventional, but the book interests and allures, with all its faults, and the writer seems always to succeed best with the portions which are the most difficult, the characters that are not stock characters, and the incidents that are least hackneyed.

No *Alternative* would not be a very badly constructed novel if we could think it possible that people could be idiotic enough to tie the original knot, which, throughout the story, the characters manage to tangle so curiously. It may also be said to the praise of Mrs. Pender Cudlip, that she has got the greatest conceivable number of love scenes, and of what she would call "jiltings," into the space of two volumes. Fastidious readers may decline to interest themselves in characters who constantly talk a slang which, as Mr. Arnold would say, "is not of the centre." To say of a gentleman that he is "a bad egg," to tell the object of one's affections that "she has got go," this surely is to speak a slang which has a provincial note. But, as Dr. Johnson observes, "the object of a writer is to be read;" and Mrs. Pender Cudlip is sufficiently experienced to know what her readers like and are familiar with. We have noted one passage as showing the immense advance in conciseness of language and vigour of style which the English novel has made of late. Mr. Claude Powers, resenting gossip about his engagement, expresses himself thus: "I'll cut any woman, and break any fellow's head, who speaks about it again, if I hear it." Compare this manly brevity with the words of Bucklaw in a little-known romance of the earlier part of this century:—

"If a lady shall question me henceforward, I shall remain silent, and in future consider her as one who has shown herself desirous to break off her friendship with me; in a word, I shall never speak to her again. But if a gentleman shall ask me the same question, I shall regard it as equivalent to an invitation to meet him in the Duke's Walk, and I expect that he will rule himself accordingly."

These pedantic remarks occur in a tale called the *Bride of Lammermoor*, which the novel-reader may have heard of as supplying the plot of an opera. But we warn him that, if he likes Mrs. Pender Cudlip, he will find Scott "slow;" and perhaps, on any historical theory of art, he is right. And yet it must require practice, and a peculiar bent of natural taste, to admire stories like *No Alternative*, and heroines as fickle as Mr. Trollope's heroines.

People who are absolutely devoid of humour and of fancy sometimes think they can supply the want by laying their scenes in future times, or in "undiscovered isles." "Anything might happen under the Plantagenets," says Miss Braddon, and of course it is impossible to say what may not happen in the twenty-ninth century. This book is the last and feeblest reverberation of the success of the *Coming Race*. The writer thinks that he has done enough when he has been inanely absurd, and is cheerfully unaware of the difficulty of making absurdity interesting. It needed all the genius of Swift to make Laputa seem real, and Bacon and Campanella failed to produce attractive fictions in the *New Atlantis* and the *Civitas*

Solis. It is some slight comfort to learn that, in the twenty-ninth century, faith and science are to reconcile their difficulties, and find a *modus vivendi* in an open Bible. The education of youth is to include a visit to "the wilderness and other Biblical arenas." Perhaps by that time the successors of Dr. Beke and Dean Stanley will be agreed as to which is the genuine Sinai. Alluding to the surgery of his period, the author tells us "his skull has been broken twice." That seems probable enough, but "the time has been that, when the brains were out, the man" did not blazon the fact by writing dreary nonsense. We quite agree with him where he says that "the phantasies of brain-dream are unworthy of print;" and we only regret that he did not act on his opinion, and keep his *Annals* in manuscript.

Chaste as Ice, Pure as Snow is apparently the work of an unpractised hand. It would be only too easy to point out errors of language and style that might have been corrected with a little care. But no one talks third-rate slang, and none of the characters run about on all fours, like the Being whom Lord Frampton kept behind the iron door, in Mrs. Casbel Hoey's story. Besides verbal faults, Mrs. Despard's book is weak in construction. There is a hypocritical attorney, who is dragged into the plot with no apparent reason. And though the author's moral purpose is to confute cynicism, it is asking too much of our faith to exhibit a pair of lovers brought more closely together by the man's passion for an unattainable woman, and a would-be seducer who is converted by the amiability of the child of the lady he wishes to ruin. The characters wander all over Europe too much, and converge in the Grindelwald too opportunely. And the scene of the proposed duel without seconds reminds one of the grotesque duel on the edge of the crevasse in Charles de Bernard's amusing *Paratonnerre*. Every reader of *Ivanhoe* must have regretted that the Templar had to fall down in a fit in his battle with Wilfrid—it was a weak way of cutting the knot; but Mrs. Despard has imitated the expedient in this remarkable scene. With all these faults, the book has sympathy with life and nature, has humour and truth when Mrs. Despard is writing of more familiar events than lonely duels, and wolf-hunts in Courland. There is promise of a kind in the story, and there would be more if the weaker parts were less fluently written.

A. LANG.

LYCIDAS IN LATIN.

Lycidas. By John Milton. Reprinted from the First Edition of 1638, and collated with the Autograph Copy in the Library of Trinity College, Cambridge. With a Version in Latin Hexameters. By F. A. Paley, M.A. (London and Cambridge: Bell & Sons, 1874.)

THE interest of Mr. Paley's collation of the first printed edition of *Lycidas* with the autograph copy will be great for all who care for the minutiae of English scholarship:—

"Both the original manuscript and the first edition," says Mr. Paley, "afford interesting proofs how unsettled was the science or the practice of spelling, even with learned and literary men, two and a half centuries ago. It is also curious to notice the wide departure from Milton's original spelling that is perpetuated in

the modern editions. Some (but very far from all) of the MS. variations have been published in vol. vi. p. 60–62 of Mr. Todd's edition, 1809; but he wholly disregarded the minor peculiarities in the spelling, which are here (with permission) correctly published for the first time."

Perhaps the fact of most interest for the lovers of Milton's poetry brought to light by the collation is that in v. 156, which is given in the ordinary editions, "Where thou perhaps under the *whelming* tide," Milton's autograph has "*humming* tide," and so the printed edition, with a correction to *whelming* in Milton's handwriting in the margin. It is seldom that we thus get a glimpse into the varyings of a poet's fancy.

In attempting a Latin translation—"the literary amusement," as he says, "of spare hours"—Mr. Paley has undertaken a natural and legitimate, but exceedingly difficult, task. Milton is, of all English poets, the one who has most completely absorbed and reproduced the spirit and the music of Virgil; but in doing so he has also breathed into English verse a spirit and a music quite original and unique. His lines are penetrated with the soul of Roman and Italian harmonies; his workmanship in detail is elaborate as that of Virgil himself; no English poet, and few poets of any age or nation, have had so rare and so austere a sense of the inner connexion between the highest thoughts and the best and most musical language. But while in reading *Lycidas* we seem to hear Virgil's music, we seem to hear it at the same time deepened and solemnised under the handling of a master who is himself a great creative genius. A translator of *Lycidas*, therefore, must not be content with being merely Virgilian; he must attempt also to infuse the spirit of Milton into Virgilian verse; a difficult, perhaps an impossible task. Mr. Paley's version, always elegant, somewhat pales both in detail and in general effect before the richer poetic colouring of the original. As a specimen of his happier style we may quote his translation of vv. 132–149.

"Return, Alphous, the dread voice is past
That shrunk thy stream: return, Sicilian Muse,
And call the vales, and bid them hither cast
Their bells, and flow'rets of a thousand hues.
Ye valleys low, where the mild whispers use
Of shades and wanton winds and gushing brooks,
On whose fresh lap the swart star sparsely looks.
Throw hither all your quaint enamell'd eyes,
That on the green turf suck the honied showers,
And purple all the ground with vernal flowers.
Bring the rathe primrose that forsaken dies,
The tufted crow-toe, and pale jessamine,
The white pink, and the pansie freakt with jeat,
The glowing violet,
The musk-rose and the well-attired woodbine,
With cowslips wan that hang the pensive head,
And every flower that sad embroidery wears:
Bid Amaranthus all his beauty shed,
And daffodills fill their cups with tears,
To strew the laureat hearse where Lycid lies."

"Deficiens, Alphée, redi; qua exaruit unda
Vox horrenda silet: cape vires, vosque, Camenae
Sicelides, vallesque et florida rura vocato,
Rura vocato suos ut mittant mille colores,
Silvae delicias, et pendentes hyacinthos.
Vos quoque, depressae valles, qua lenia ludunt
Murmura, qua coeunt umbrae ventique protervi
Rivorum et scatebrae, quois rara Canicula dira
Luce nocet, roremve recentibus excutit herbis,
Huc iacite omnigeni rutilantes floris ocellos,
Gramine quom viridi mellitas ducere guttas
Purpureisque iuvat terram conspergere gemmis.
Huc veniat quae nunc moritur deserta per agros
Primula vere novo, parilique illa altera forma,
Demissi capitis luctus imitata decentes:
Cristatum tollas et tu, ranuncule, culmen,
Jasminum pallens, atque albo flore dianthus,
Lucentes violae, et foliis carbone notata
Nomen habens luctus, et nominis acmula curae,
Castoreum spirans rosa, vestitaeque corymbis
Pallentes ederae, nec marcentes amaranthi,
Et si quis pullo flos est distinctus amictu,
Depluat asphodelus lacrimas, ferat adus honores
Funereos Lycidae busto, laurique coronent."

In some instances Mr. Paley seems to miss points in the original that should have been brought out: for instance, "Blind moutthes" is hardly rendered adequately by "Ignavum vulgus, caeci, gens bruta, nepotes;" or "scannel-pipes of wretched straw," by "stridente avena;" or "Let our frail thoughts dally with false surmise," by "Si mihi mens ficta se pascet imagine veri;" or "with new-spangled ore," by "Auro auro." H. NETTLESHIP.

MINOR LITERATURE.

Wilkes, Sheridan, and Fox. By W. F. Rae. (London: Isbister and Co.) The period of English history that lies between the beginning of the Seven Years' War and the battle of Austerlitz, the epoch contained in Mr. Rae's volume, has a peculiar interest to the political student. Absurd as the system of representation was, it was a time in which great public spirit was felt and expressed, when there was a genuine public opinion, though the direction which it occasionally took was passionate and erroneous. Illiterate as the nation was, it had an interest in politics which was far more keen than the languid, fickle, and selfish interpretation given to public duty in our day. Of course, a full narrative of public events and sentiments in the half century and more referred to, would be a considerable history; and there is no little convenience in grouping the facts of the age round the biography of a few eminent names, because such a plan enables the author of a book to select his facts, and to impart life and vivacity to his narrative. Political biography has, therefore, become a favourite form of historical composition. Macaulay's Essays are more read than his History, and have given far more insight into historical events than his more elaborate productions have. Few compositions give a more vivid picture of the Great Rebellion than Mr. Goldwin Smith's essays on Pym and Cromwell.

It cannot be said that Mr. Rae has been happy in handling his subject, or that he has given us any new view of the three conspicuous personages whom he has thought proper to call the Opposition under George III. In point of fact there was no genuine opposition to the administration during the whole of George III.'s reign, as there was to that of Walpole in the days of George II., because there were no statesmen able or willing to guide popular sentiment, or interpret popular demand. The long-continued power of the Tory party was not due to the sympathy of the nation, but to the incapacity of those who criticised successive administrations. The three men whom Mr. Rae has selected as the subjects of biography were men of great parts, and two of them were masters of Parliamentary eloquence. But Wilkes was a profligate, whom accident made into a patriot, and administrative folly rendered formidable. The services which he indirectly contributed to public liberty were not spontaneous, but the incidents of self-defence. The generous traits in Sheridan's character, and the real brilliancy of his genius redeem the utter waste of his public life. If he had possessed solid and trustworthy abilities, it would have been impossible that he should have failed in securing a practical recognition of his merits. And Fox, despite the warmth of his nature, the generosity of his sentiments, and the vigour of his eloquence, was wholly unable to understand the reforms of Pitt's earlier career, or to stem the reaction which that minister effected in 1792. An Opposition is never powerless and baffled unless it is simply incompetent to discharge its functions.

Mr. Rae has not been successful in dealing with the facts of the case, nor in the manner in which he has stated them. For example, he has throughout his Life of Wilkes spoken contemptuously of Horne Tooke, a man whose capacity was infinitely wider than that of Wilkes was, and whose character was infinitely higher. The Life of Sheridan is to a very large extent a discussion on the merits of Sheridan as a dramatic author; that of Fox, the best of the three, is an elaborate panegyric; while

all are padded with anecdotes the taste of which is very dubious, and with reflections the value of which is very questionable.

Waste Products and Undeveloped Substances. By P. Le Simmonds. The author in his preface states that he published a book some eleven years ago under the above title, but as it had long been out of print it appeared to him desirable to prepare a volume which should afford some information to experimenters and manufacturers. We give some examples of the information afforded.

At page 53 we find the heading "Economic Uses of Dead Animals," which forms the subject of several subsequent pages. Thus we read that in London upwards of 400 horses die weekly within a radius of five miles from Charing Cross, and the flesh is chiefly sold as food for cats and dogs within that area; after describing the uses of the other parts, the author tells us that the hoofs are made into pin-cushions and snuff-boxes. Surely the number of dead horses one meets exceeds one fourth the number of the last-named ornaments made from their hoofs. In the next few pages the eating of dead horses is strongly urged. We find that in Berlin in the last seventeen years 30,000 horses have been killed and the flesh used as food, we presume for the human race, and that old cab horses, wall-eyed and broken-kneed, are found to be delicious eating, when treated by a really artistic hand, and that the price of the flesh is 2½d. per pound. We imagine the "really artistic hand" would be found only in the cuisine of the wealthy, who, in this country, are hardly likely to affect horse while they can pay for beef and mutton, while on the other hand it is improbable that the poorer classes would relish such an innovation, showing as they do such a distaste for Australian meat. More unsavoury substances are recommended for consumption. Old boots for instance. Thus we read that throwing an old shoe after a newly-married couple will have a new application hereafter. It will be not only an emblem of good luck but a substantial present. After describing the experiment of making a pudding or jelly out of an old shoe, the author candidly adds that it was the colour of molasses, and looked like incipient glue; several tasted it, and spittoons were at once demanded.

Under the head of "Waste Coal" the author begins by stating that of the millions of tons burnt in manufactories, steamboats, &c., one-half and sometimes three-quarters is wasted and lost; nine-tenths would probably be nearer the mark. There is a great deal of interesting information scattered about in the book, which, however, might easily be compressed to one half its size, and which would be much more useful to the experimenter and manufacturer if its contents were "classified and arranged systematically," as the author states in the preface that he has endeavoured to do.

As an example of the want of arrangement we have a heading, "Waste Products of Fisheries," p. 138, a long quotation from Mr. Braithwaite Poole, at p. 154; the heading "Use of Fish as Manure" on p. 155, the same again at p. 162, with the quotation mentioned repeated verbatim.

In another part of the book we find that necklaces are made of monkeys' teeth. It would be interesting to know whether these are considered undeveloped substances or waste products, perhaps in the youth of the proprietor the former, in old age the latter. EDITOR.

NOTES AND NEWS.

We are informed that a committee has been formed at Venice, composed of an equal number of Italians and Englishmen, for the purpose of organising a project for the erection of a monument to Lord Byron at some suitable spot in the Venetian territories. Contributions are earnestly requested in furtherance of this scheme.

DR. MAX SCHLESINGER has just completed, in the supplement to the *Kölnische Zeitung*, of April 9, the translation of *Prince Florestan of Monaco*, which he dismisses in these words:—

"The reader will long since have discovered for himself that the whole of this story is pure invention, a satire which has originated at Cambridge, and which, on account of its earnest sportiveness, or its sportive earnestness, deserves a ready welcome in our sternly-serious times, notwithstanding the monstrous sins of omission and commission of which it is guilty in regard to the *Almanach de Gotha*."

A PAMPHLET, by Miss Natalie Zahle, on *The Intellectual Culture of Women*, is making a great sensation in Denmark. The talented authoress, who has good experimental knowledge of her subject, makes some very practical suggestions for the formation of high-class colleges, where women may easily and inexpensively obtain a thoroughly academical training.

THE *Index* (Boston, March 26) announces that Mr. Gladstone has in view the retirement from the House of Commons to the House of Lords. "We should think," the editor adds, "that Mr. Gladstone would much rather be a man than a lord."

THE citizens of Ferrara intend to celebrate the centenary of their great townsman, Ariosto, on September 8 next, with all fitting honours. A "Comitato Ariosteo" has been formed to make the necessary arrangements, and the Roman poet Pietro Cassa has been entrusted with the task of writing an historical comedy on Ariosto for the occasion.

In the *Allgemeine Zeitung* of April 4 appeared the last of a series of papers devoted to the consideration of John Stuart Mill's *Autobiography*, of which they give a very full summary, interspersed with numerous extracts, translated verbatim from the original. The interest which Germans take in our public men, and their intimate acquaintance with our current literature and those who cultivate it, form a striking contrast to our indifference to, and very superficial knowledge—or perhaps, more correctly speaking, our general ignorance—of, the men and works that belong to the literary world of our neighbours on the Continent.

WE have received from Messrs. Sandoz and Fischbacher, the first and second series of a French version of "The Men of the Third Republic," a series of sketches which first appeared in the columns of the *Daily News*, with the exception of two sketches, that of the late M. Beulé and of M. Paul de Cassagnac, which were specially contributed by the author to this edition. Students of politics will turn with interest to an indirect passage of arms in the preface to the second series between M. Louis Blanc and Mr. Grenville-Murray. We have the authority of the former for saying that the translation, which is by M. Henri Testard, is excellent.

THE Royal Academy of Sciences at Amsterdam has awarded its gold medal to the poet, P. Esseiva, for the best Latin elegy. This is the fourth time that he has carried off the prize in the same department of competitive contest.

THE Royal Institute of Science and Literature of Lombardy offers a prize of 1,500 lire for the best "Libro di lettura per il popolo Italiano." Foreigners are allowed to compete, but all essays must be in Italian.

MR. O'SHAUGHNESSY calls our attention to two misprints in the passage extracted from his works at page 360, col. ii. In the fourth line, by an obvious clerical error, *to* was printed for *from*; and in the seventh line, *latest* should have been *rarest*.

A NEW Italian review has appeared at Milan, under the title of *Rivista Italiana di Scienze, Lettere, ed Arti*. It contains contributions from César Cantù, the historian; G. Careano, the novelist; A. Stoppani, G. Sacchi, Salvat, Farini

Eug. Torelli, and Viollier, whose names are sufficient to show that the new review will prove an important addition to Italian literature. We also hear from Rome of the appearance of the first fascicolo of a new weekly periodical, entitled *Progresso Educativo d'Italia*. These publications afford a gratifying proof of the growth of interest in literary matters in Italy, where reviews were almost unknown a few years ago.

THE Danish critic, Dr. Georg Brandes, has just published another volume of his *Main Streams in the Literature of the Nineteenth Century*, an admirable work, which is fast making for its author a European reputation. The present volume, *Reaktionen i Frankrig* (Hegel), deals, as its title implies, with the pietistic reaction in France after the Revolution had worn itself out. The subject lends itself particularly to that vein of half-cynical, half-sympathetic analysis which is Dr. Brandes' habit of mind, and the prophets and pilgrims of that marvellous epoch are presented to us without caricature, but under a powerfully concentrated light of humour. The chapter dedicated to Chateaubriand and his seraphic epos is one of the best in the book; it is comparatively easy to write of the author of the *Martyrs* in a strain of rapturous pietism; it is equally easy to treat him with vituperation and contempt. Brandes does neither, but analyses the internal conditions of Chateaubriand's intellect, and the external influences of his age upon him, with an exquisite delicacy worthy of Sainte-Beuve. Only less interesting than this are the passages that deal with Madame de Krüdener, and with Lamartine, respectively. We learn that the next volume of this admirable work will deal with Byron and Shelley, and the naturalist reaction in English poetry. It remains to be seen whether so delicate a critic as Dr. Brandes will be able to escape the blunder that all continental writers on English literature make, in exaggerating the influence and excellence of Byron to the disparagement of Wordsworth and Shelley.

THÉODORE DE BANVILLE's dramatic poem of *Gringoire*, gracefully translated by Alfred Larsen, is having an unusual success on the boards of the Christiania Theatre. Neither Björnson nor Ibsen has written an original play lately for the Norwegian stage, and in the absence of these poets the public of Christiania may be congratulated on having anything so refined as a piece of De Banville's.

THE French Société des Gens de Lettres has this week exhibited considerable wisdom and dignity in a difficult and delicate dilemma. Certain rabid politicians of the monarchical press, assuming the gratuitous functions of police spies for the purpose of assuring the Government that literary talent and political orthodoxy are indissolubly united, have for the last twelve months been requiring of the Société des Gens de Lettres that it should expel its exiled Communistic members. These demands were met with contemptuous silence by the society, but they have at last attracted the attention of the Government. In virtue of a decree promulgated in 1856, the society is in receipt of an annual subvention from government of twelve thousand francs; and according to M. de Broglie, this grant confers on the Cabinet the right to interfere in the internal administration of the society. The Government has therefore demanded that the names of all needy members succoured by the literary corporation shall undergo ministerial inspection. It is loath to render it possible for the money of the State to revert to enemies whom the State has punished. M. Gonzales, the secretary of the Société des Gens de Lettres, has responded to this "invitation" with a categorical refusal. He states that the society itself does not know whom it succours; all applications being examined by a sub-committee sworn to secrecy, which reports on each case to the full committee without divulging the names concerned. He adds that the society, as a body,

entertains "la haine de la politique," and regards its democratic members, not as revolutionists, but as *littérateurs*. For the majority of the Gens de Lettres, Félix Pyat is simply the author of the *Chiffonnier de Paris*, Jules Vallès the writer of *Les Réfractaires*, MM. Razoua and Grousset journalists. There is little doubt but that the Société will refuse the State subvention, and content itself with expelling members guilty of crimes against common law, and leave political offenders to M. de Broglie's policemen and M. de Gallifet's dragoons.

A CONTEMPORARY last week, in the course of an interesting article on "The Tabard" writes of that old Southwark hostel—

"That exact site, and the identity of the Tabard with the Talbot, cannot be doubted. . . . As early as 1637 it had been known by either name. Taylor, the Water Poet, says in his *Carriers' Cosmographie*, printed in that year, 'The Carriers from Cranbrook and Beveden in Kent, and from Lewes Petworth Uckfield and Cuckfield in Sussex, lodge at the Tabard or Talbot in Southwark.' In the year 1670, as appears from Bedloe's *Narrative of the Popish Plot*, the old name was forgotten."

If the writer had referred to Mrs. Green's Calendar of the State Papers of the reign of Charles II., he would have found that at any rate as late as 1667 the inn was still known by either name. In the Calendar are the abstracts of two letters written from Lewes by "Sam. Rose" to the Navy Commissioners, the first of which, dated March 19, 1667, concludes with a direction for his letters to be sent to the Talbot in Southwark: "the Lewes carrier is there every Thursday before 12 o'clock;" the second letter, dated June 4 in the same year, ends thus: "The carrier lies at the Tabard in Southwark, and comes out every Thursday at 12 o'clock."

MONTAIGNE is one of that small company of cosmopolitan authors whose works are as highly esteemed abroad as in their own country. Besides his intrinsic merit, his works have excited a direct and considerable influence on English literature, and both Shakespeare and Bacon show clear traces of the study of the great French essayist. Some details, therefore, of the earliest editions of his essays, and of recent work at them, cannot fail to be of interest.

The Essays were first published in 1580, and editions with variants appeared in 1582, 1587, and 1588. The first edition is very rare, and a copy fetched 2,000 francs at the Radziwill sale; it has been reprinted, with the variants of the two next editions, by MM. Dezeimeris and Backhausen, for the Société des Bibliophiles de Guyenne, while the first volume of the edition of 1588 has been reprinted, with a preface from the pen of M. de Sacy, by M. Jouast.

Montaigne only superintended three editions; those of 1580 and 1582, which present only trifling differences, and that of 1588, which contains an additional book—the third. At the time of his death he was preparing a new edition, with a considerable increase to the contents of the chapters. The Library of Bordeaux possesses Montaigne's own copy of the edition of 1588, the margins of which are covered with notes in his own handwriting, unfortunately somewhat mutilated by the binder, but containing 600 additions to the printed text. Now various details would seem to point to the conclusion that this copy was not used by Mdlle. de Gournay, Montaigne's adopted daughter, for her edition of 1595, but rather some other incomplete copy in which Montaigne had entered his surplus notes. This edition, amended by cancels issued in 1598, constituted the received text till Naegeon, who professed to return to Montaigne's own copy at Bordeaux. All these editions are inaccurate; and it is now proposed that MM. Dezeimeris and Backhausen should publish a text of Montaigne as scrupulous and scholarlike as the edition of Pascal's *Pensées* by Victor Cousin, who was keenly alive to the necessity of a like edition of Montaigne; and

should so arrange the pages as to show the reader at a glance the successive changes introduced by the author into the text. There are two difficulties to contend with. Mdlle. de Gournay's mind was of a somewhat *bizarre* order, so that she was scarcely suited by nature to edit the works of Montaigne; and it will be an almost impossible task to distinguish among the author's notes between those which he meant to embody in the text, and those which were simple comments or suggestions for his own guidance, or subjects for further reflection. Attention should be paid, also, to Montaigne's translation of Raimond Sebond, an author to whom he so often refers in his essays, and of whose works he published the original edition, now very rare, while occupied with the publication of his *Essays*, as though thereby to set himself right with the theologians of his time, and as his pupil Charron did at a later date for his book on Wisdom.

Two of the Papers that the New Shakspeare Society have reprinted, and a third which will be given out at the Society's next meeting, confirm, in a very interesting way, the high repute in which Mr. Tennyson's friends have always held his criticism of Shakspeare. Old Trinity men will tell you that when the poet and they were undergraduates at Cambridge, some forty years ago, he would read out from *Pericles* the story of Marina, and declare that that alone was Shakspeare's in the play. He would also insist that in *The Two Noble Kinsmen* large portions were written by Shakspeare, while in *Henry VIII.* many parts were written by Fletcher; and Mr. Tennyson would read out scenes to prove his point, dwelling on the peculiar run of Fletcher's lines, with their frequent extra syllables, and other specialties. Now comes the New Shakspeare Society with its metrical tests, and shows the soundness of Mr. Tennyson's judgment on all these points. Mr. Fleay proves conclusively by these tests, and other arguments, that in *Pericles* Shakspeare wrote only the parts that Mr. Tennyson had pointed out as his, the story of Marina in the last three acts, less the Gower-chorus pieces and the brothel-scenes. These Mr. Fleay assigns to Rowley. The first two Acts, Mr. Fleay agrees with Professor Delius in assigning to George Wilkins the younger, the author of the History or Novel of *The Painfull Adventures of Pericles, Prince of Tyre*, whom they consider also to have been the arranger and supervisor of the whole play. Further, Mr. Fleay has shown that Shakspeare's share in *Pericles* forms a complete play, by itself, and he has picked it out and edited it as the play of *Marina*, by William Shakspeare, so that our great poet's work can be enjoyed pure, uncontaminated with Rowley's filth and Wilkins's inanities.

So long ago as 1847, *The Two Noble Kinsmen* was analysed in a masterly paper by the late Mr. Samuel Hickson in the *Westminster Review* for April of that year. Mr. Hickson proved, by a searching criticism of the styles of the two writers of the play, that the entire plan and general arrangement of the drama were Shakspeare's; and that, with the partial exception of Arcite, every character, even to the doctor who makes his first appearance at the end of the fourth act, was introduced by Shakspeare; while Fletcher "contributed nothing in which he was not assisted by a previous draft, either in his associate or in Chaucer." This able paper—hitherto neglected by Shakspeare editors and critics—the New Shakspeare Society has now reprinted, and has added to it two confirmations by metrical tests, entirely bearing out its conclusions, (1) by Mr. Fleay, with the rhyme and extra-syllable tests, &c.; (2) by Mr. Furnivall with the stopped-line test.

Mr. Tennyson's view of *Henry VIII.* was worked out in detail in 1850, by his friend Mr. Spedding, the editor of "Bacon" in the August number of the *Gentleman's Magazine*. Mr. Spedding first examined the play by the test of style and all the qualities which that involves, and settled the shares of Shakspeare and Fletcher in it.

He then applied the metrical test of the redundant syllable; and that exactly confirmed his previous division of the play on aesthetic grounds. In the same month, Mr. Samuel Hickson printed in *Notes and Queries* an entirely independent confirmation of Mr. Spedding's results, from a paper which he, Mr. Hickson, had written three or four years before, and then set aside. But notwithstanding this striking coincidence of results, no Shakspeare editor could see the force of Mr. Spedding's arguments; and in no edition of Shakspeare is his part of *Henry VIII.* distinguished from Fletcher's. The New Shakspeare Society has now reprinted Mr. Spedding's paper, and Mr. Hickson's confirmation of it; and has, as in the former case, added two fresh confirmations of Mr. Spedding's results, by Mr. Fleay and Mr. Furnivall. The authorship of both *Henry VIII.* and *The Two Noble Kinsmen* is thus firmly settled, and the late dates of the plays finally set at rest; the value of metrical tests as aids to higher criticism has been shown, and the soundness of Mr. Tennyson's judgment confirmed.

MR. HALLIWELL will contribute to the Transactions of the New Shakspeare Society a letter on the way to determine the date of Shakspeare's Roman Plays.

PROFESSOR DOWDEN's fifth Shakspeare lecture in Dublin was on the English Historical Plays. Setting aside *Henry VIII.*—a play written probably for a special occasion, and in conjunction with Fletcher—and also the slight sketch of Edward IV. in *Henry VI.* and *Richard III.*, Shakspeare left us six full-length portraits of Kings of England. These six fall into two groups of three each. One group consists of kingly weakness, the other of kingly strength. In the one group stand King John, King Richard II., and King Henry VI.; in the other, King Henry IV., King Henry V., and King Richard III. John is the royal criminal, weak in his criminality; Henry VI., the royal saint, weak in his saintliness. The feebleness of Richard II. cannot be characterised by a word. Richard III., in the other group, is a royal criminal, strong in his crime. Henry IV. is strong by a fine craft in dealing with events, by resolution and policy, and equal caution and daring. The strength of Henry V. is that of plain heroic magnitude, thoroughly sound and substantial, founded upon the eternal verities. Here, then, we recognise the one dominant subject of the Histories, how a man may fail, and how a man may succeed, in attaining a practical mastery of the world; and the characters of these plays all lead up to Henry V., the man framed for the most noble and joyous mastery of things. On each of the kings' characters, and the lesson to be drawn from it, the Professor dwelt at some length.

A NEW Shakspeare Dictionary, a thoroughly careful and sound one, of which twenty-one sheets are already printed (up to the verb *drink*),—this is a welcome announcement. We need hardly say that the writer of the Dictionary is a German, Professor Schmidt, and that the book is well done. The particle *a* has five quarto columns of small, though clear, type given to it; the verb *be* has six columns, all the peculiarities of its use—its construction with verbs, instead of *has*, &c.—being noticed. The verb *do* has four columns devoted to it. The Dictionary, indeed, is on the plan laid down for the Chaucer Society's Concordance and the New Shakspeare Society's Concordance, less the derivations of words, and the giving of quotations in full. Still, Professor Schmidt does give in full all the quotations needed for working purposes. We are heartily glad to see so good beginning of so excellent a book; and we urgently call on Messrs. Williams and Norgate—to whose kindness we are indebted for the advance sheets—to make arrangements with Professor Schmidt to publish the Dictionary in parts. The present twenty-one sheets would be of very great service to all Shakspeare students, and would hardly fail to secure a good sale here and in America, in con-

sequence of the fresh impulse that the New Shakspeare Society has given to the study of the poet's text.

THE first volume of Professor von Noorden's *Europäische Geschichte im achtzehnten Jahrhundert*—or rather, to give the second title, *Der Spanische Erbfolgekrieg*—appeared nearly four years ago. Its excellent workmanship and deep research secured for it the approbation of competent scholars. No former work, not even Lord Stanhope's *Reign of Queen Anne*, is based on so firm a foundation of documentary evidence. The second volume takes us into the three years which followed the battle of Blenheim, and treats alike of the military and political history of the whole of Europe. Unfortunately the ill feeling generated by the late war cut the author off from access to the French archives, but he has been able to make diligent use of the State papers of London and Berlin, of Vienna and the Hague.

M. AMÉDÉE THIERRY's last work has just been published by Messrs. Didier. It is entitled *Saint Jean Chrysostome*, and forms a volume of the series of *Récits de l'Histoire Romaine au cinquième Siècle*.

THE *République Française* is publishing an exact copy of a hitherto inedited memorandum-book in which Kléber jotted down with his own hand his reflections during the First Napoleon's Egyptian expedition. The estimate of Bonaparte by his rival is specially interesting:—

"There are men who must only be judged by results; they would lose all if their conduct were scrutinised in their means of attaining their ends; Bonaparte is of this number. Turenne won his glory because he fought against Montecuculi, the greatest general of the age. Bonaparte has gained his celebrity by fighting against all the imbecile generals of the house of Austria. Is he beloved? How should he be? He loves no one, but he thinks that he makes up for it by making himself creatures with promotions and presents. He takes to himself, he says, all the mistakes before Acre. He could not help it. Is he wicked? No; but that is because vices come from a man being an ass, and he is no ass. He can neither organise nor administer, and yet, wishing to do everything, he organises and administers. Thence disorders, wholesale waste of every kind; thence absolute destitution, this misery even in the midst of plenty. Never any fixed plan; all advances by leaps and bounds; the day decides the business of the day. He pretends to believe in fatality. What, then, is his great quality, for after all he is an extraordinary man? It is that of daring and daring again, and in this art he passes the bound of temerity."

The last remark reminds us of Danton's famous apophthegm. Kléber's antipathy to Bonaparte gradually increases in intensity, and he at last pronounces him "a miserable charlatan with more ambition than talent." Kléber, however, was jealous of his rivals, and in these notes he characterises Hoche as one of the worst generals of the Republic.

M. ALFRED RAMBAUD has contributed to the number of the *Revue des Deux Mondes* for April 1 another of his interesting Russian studies. The subject of his present article is the immense collection which has recently appeared at St. Petersburg of documents illustrative of the siege of Sebastopol, out of which enormous mass of raw material he has skillfully selected enough to enable him to present to his readers an artistic representation of the most striking scenes which took place within the walls of the beleaguered city. To English readers, of course, the article cannot prove quite as interesting as it justly does to French, for the English troops, to judge from M. Rambaud's descriptions, do not seem to have had much to do with the siege. They were wanting, moreover, in the delicacy which marked their French allies. On one occasion, during a truce, an English general was seen attentively examining the Russian works through a glass. A French general rushed up to him, remonstrated vehemently, and

seemed to want to take his glass from him. At last the Englishman grumbled out something, and withdrew sulkily behind the line of demarcation. "Several French officers who were present on the occasion loudly protested against this violation of the laws of war, and spoke with the utmost contempt of the conduct of this English general." The Germans figure as disadvantageously as the English when compared with the French. Some Russian officers who had been taken prisoners and exchanged, were presented to the Emperor Napoleon III., on the occasion of their leaving Paris. He treated them not only with courtesy but with generosity. But when they reached Berlin, neither the people nor the Government showed them the slightest attention. One day, when they were refused admission into a church where some ceremony was going on, they appealed to an officer of rank who was passing by, explaining who and what they were. To which he replied that he did not care in the least who they were, and that what they wanted was nothing to him. On which they withdrew in disgust, "having no other wish than to get out of Berlin as quickly as possible."

In a review of the Court-Rolls of Epping Forest, contained in our last, an example was given of the form of licence to hunt, hawk, etc., current at the beginning of the eighteenth century. It may be interesting to compare it with the following hunting-l licence, granted to a sporting bishop in the year 1189, taken from the original, under the great seal, in the British Museum:—

Ricardus, dei gratia Rex Angliæ, Dux Normanniæ, Aquitaniæ, Comes Andegaviæ, Archiepiscopus, Episcopus, Abbatibus, Comitibus, Baronibus, Justiciariis, et omnibus Baillivis et ministris suis, Francis et Anglis, Salutem. Sciatis nos concepisce et presenti carta nostra confirmasse Rainaldo [Fitz Joceline] dei gratia Bathonensi Episcopo et eius successoribus in perpetuum Canes suos ad fugandum per totam Somersetam sicut ipse vel aliquis antecessorum suorum eos umquam melius vel liberius habuit, videlicet ad capiendum omnes Bestias præter Cervum et Cervam et Damum et Damam. Volumus etiam et concedimus quod ipse et omnes successores sui de omnibus Bestiis in Pareis suis fugatis si exierint libere et quiete suum habeant percursum. Et ideo prohibemus ne quis prædictum Episcopum vel successores suos super hoc in aliquo disturbet super decem Libras forisfacturæ. His testibus, Baldwino, Cantuariensi Archiepiscopo, Hugone Dunelmensi, Hugone Coventrensi, Episcopis, Willelmo Marescallo, Hugone Barloff. Datum per manum W[illelmi de Longchamp] Eliensis electi Cancellarii nostri xxvi. Die Novembris apud Cantuariam, Anno Regni nostri Primo.

M. GEORGES PICOT has read before the Academy of Moral and Political Sciences an interesting Memoir on the "Elections to the States-General from 1302 to 1614." The election of members to these great political assemblies, which were convoked by the King at any great crisis, was not established in virtue of a constitution, of a principle, or a general law, but by the nature of things. At the beginning of the fourteenth century elections were not known, either in the towns, which had never before been represented in political assemblies, or among the nobles, each lord believing himself entitled to a seat in virtue of his personal right; it was in the order of the clergy that the first elections took place, and prelates convoked personally by the King as his vassals sat side by side with their elected representatives. But the prelates, like the nobles, often sent substitutes to sit in their stead. In the towns also the system of elections was soon found necessary, as the magistrates could not, or would not, represent them as a right, and did not always think themselves authorised to directly nominate the deputies.

The chief cause, however, of the introduction of the representative system into all three Orders, was the establishment of Provincial States, the majority of which sprang up, we scarcely know how, in the first half of the fourteenth century, partly perhaps in consequence of the general dissatisfaction caused by the battle of Poitiers. Before 1355, the royal summons was addressed to persons more

or less capriciously selected at the will of the sovereign, a kind of assembly of notables was thus formed. Later on, the Orders as such were convoked, the choice of representatives was left to them, and their mode of procedure was necessarily by election.

In 1483 election became the established custom, and in conformance with the King's letters, the nobles, churchmen, and citizens of each bailiwick met to elect in common three deputies, one from each Order. Henceforward, no one sits in his own right; the bishops themselves are only representatives. The debates of the three Orders are in common, and deal, not with the requirements of one class or another, but with the interests of the country at large.

The separation of the Orders was not spontaneous, but was due to the Government, and it is found in the States-General of 1560, 1576, 1588, and 1614. The system of administration had nearly attained its full development under Francis I. The writs addressed by the King to the bailiffs and seneschalls reach them through the governors, and contain all necessary details as to the place of meeting and other points. Afterwards they go down step by step to the very lowest rank in the judicial hierarchy, reaching the smallest parishes, where their contents are brought by the parish priests to the knowledge of all. Immediately after the village assemblies are formed, and the first complaints formulated. Their grievances are sent up by delegates, and grouped in the general assembly of bailiwicks, and it is this assembly which sends deputies to the States-General. So, as the King's letters reached step by step to the inhabitants of the meanest village, the wishes of the nation rose step by step to the throne.

The remainder of the paper entered into such minute details that an analysis is impossible; and we can only refer our readers to the forthcoming *Bulletin* of the Academy, in which it will be printed in full.

NOTES OF TRAVEL.

IN one of the French official reports on the Vienna Exhibition, some details of interest are given respecting the coral fisheries of Algeria. It appears that the reefs extend in a continuous line from Bône to a point beyond La Calle, and at intervals in other places, notably at Mers-el-Kébir, near Oran. Since the sixteenth century various efforts have been made by the Government to promote this industry, and one effect was the creation of a thriving trade at Marseilles in the making up of the coral for ornaments. But during the wars of the Empire, England assumed the fishery rights and handed them over to Sicily and Greece. The coral manufacturing industry thus passed over to Italy, and has since remained centered in Naples. The fishery is carried on under the surveillance of a French vessel. Foreign vessels pay 30*l.* for the right of fishing, vessels of French make and ownership half that sum, while owners resident in Algeria, and owning vessels manned by native crews, pay nothing. Each reef is divided into ten parts, only one of which is allowed to be explored during the current year, so as to admit of the development of the product. During last season the coral fishery occupied 311 vessels manned by 3,150 sailors, nearly all of whom were Neapolitans from Torre del Greco. Only twenty craft came from Genoa. The annual value of the fishery is about 3,000,000 francs, or about 113,000*l.*

A PARAGRAPH has lately gone the round of the newspapers, mentioning the discovery of coal near Pankabári, at the base of the Sikkim Himalayas. The true facts are, we believe, the following:—Some twenty-five years ago Dr. Hooker, when exploring the country near Darjiling, noticed plant impressions, similar to those found with the coal of Rániganj, in the neighbourhood of Pankabári. No opportunity for a careful examination of the country, which until lately was covered with

dense forests, occurred until the present year, when Mr. Mallet, of the Indian Geological Survey, was despatched to examine the spot more carefully, and he has succeeded in finding several seams of coal, but they are so much smashed and altered that it is uncertain whether the discovery will be of much practical value. This is the first known instance of the occurrence of coal, belonging to the true Indian coal measures, in India, north of the Ganges valley, all the previously reported coal beds in that direction having proved, on examination, to be tertiary lignites in quantities so small as to be worthless.

LAST YEAR the attention of the Government was drawn to a statement from a private source to the effect that peat, available for fuel, was found in considerable quantities in various parts of the United States, and that operations were being undertaken for the collection of that article, which it was estimated might be supplied at a price far inferior to that of coal. Lord Granville, therefore, instructed our consuls in the States to furnish him with a report as to the production and preparation of peat within their respective districts, together with particulars respecting its price, and the relation of such price to that of coal. These reports were duly sent to the Foreign Office, and have just been printed and laid before Parliament. They by no means hold out any hope that at last a cheap and efficient substitute for coal has been found. The fullest information on the subject is given by Consul E. M. Archibald, of New York. From his account, we gather that in almost all the northern portion of America there are extensive peat-bogs, formed by decomposition of plants, amid much moisture, as in marshes, from the accumulation of mosses, which, while their lower parts are being converted into peat, throw out new shoots in their upper parts, thus gradually changing shallow pools into bogs. In the south, this formation of peat does not take place, the decay of vegetable matter, after life has departed, being there too rapid under a high temperature. The manufacture heretofore of peat-fuel in the United States, except in cases where coal is very costly or difficult to procure, has been a complete financial failure. The scarcity of coal during the civil war greatly stimulated the attempts to find some substitute. No fewer than forty-seven companies, with capital varying in amount from 50,000 to 5,000,000 dollars, were organised for the purpose of raising and preparing this fuel; every one has failed. At the Berlin bog, on the Hartford and New Haven railroad, in Connecticut, a practical utilisation of peat by new machinery has lately been attempted, which is capable of turning out 100 tons per day for the 150 working days from April to November. The selling price of the prepared peat is five dollars per ton. The adaptability of it for all purposes for which coal is used is fully admitted, but the difficulties in the way of preparing the fuel prevent any advantage over its rival in the matter of cost.

It is stated that there is a plentiful supply of good coal in Labuan. No. 1 seam (six feet ten inches thick), which is 474 feet from the surface, has been penetrated, and it is intended to persevere with the sinking of the shaft until No. 4 seam (eleven feet thick) is reached, when there will be inexhaustible supplies of excellent and cheap fuel.

THE coal-beds of the Faroe Islands have been examined by Professor Johnstrup. The area of the main mass, in Suderö, is about five English square miles. The Professor's opinion is that the Faroe coal is Miocene, that is, belongs to the central division of the Tertiary period. In illuminating power it averages nine-elevenths of that of good English coal.

THE consular inspection of the trading stations on the African coast has, we learn, now been completed south of Zanzibar, and many additional slaves liberated at Kilwa. The greatest credit seems due to Captain Elton, the officer to whom

the completion of this difficult task has been entrusted. There seems no doubt that the land traffic is now being regularly organised with a view to shipment from points on the coast, which, with the miserably inadequate squadron now maintained, is matter of little risk or difficulty.

THE Japan branch of the Royal Asiatic Society has published the first volume of its *Journal of Transactions*. At a recent meeting of the Society, Mr. E. M. Satow, Japanese Secretary of H.M.'s Legation at Yedo, read a paper on the Shintoo shrines of Isé.

A RUSSIAN officer informs the Bokhara correspondent of *Indian Public Opinion*, that he should not be surprised if during the coming summer, after crossing the Amou Darya, the Russians advance on and take Balkh, and afterwards endeavour to extend their conquests *via* Mamanae to Herat.

LETTERS were received on April 8 at the office of the *Allgemeine Zeitung*, at Augsburg, from Professor Zittel, who announces that Dr. Rohlf's at the head of his caravan had arrived in safety at Siut, the celebrated oasis of the temple of Jupiter Ammon. The men and animals were reported to be in a satisfactory condition, although they had undergone frightful sufferings, and encountered extraordinary fatigues and difficulties in their thirty-six days' march over the barren sands of the Libyan desert.

A REPORT was at one time current in Vienna that all the members of the Japanese Commission, who left the Austrian capital at the close of the Exhibition, had been drowned on their homeward-bound voyage by the foundering of the steamer *Nile*. This, however, proves to have been a false announcement, although there would unhappily appear to be no doubt that a large number of persons, probably about ninety, perished when this vessel, which belongs to the French Messageries line, struck on a rock off the coasts of Japan, at a point where the navigation is always dangerous from the roughness of the sea induced by sunken rocks. Not a single member of the Japanese Commission was numbered amongst those who went down, but it would appear that the greater part of the cargo which is lost belonged to the Government or Emperor of Japan, and included, amongst other articles of value, the whole of the interesting collections which had been designed for the great museum about to be organised with a view of extending a knowledge of western art and industry among the Japanese. One of the principal objects aimed at by the Government of Japan in appointing a Commission to report upon the Exhibition at Vienna, had been to obtain such specimens of western industrial and artistic skill as should serve to illustrate to the people of Japan the present condition of European progress, and the collections now lost are said to have been made with extreme care. It has been proposed, but not, we should imagine, with much hope of success, considering the great depth of the Japanese seas, to employ divers for the recovery of some of the more precious objects of art.

THE annual report of the (Jamaica) Island Chemist is quoted by Governor Grant as showing one fact as unexpected as well as satisfactory, and as partly accounting for the great healthiness of Kingston as a tropical town; namely, the purity of the water supplied by the pipes from the Hope River. It has even less of organic impurities than the Glasgow water from Loch Katrine, and less also of nitrogenous impurities. It has six degrees less of hardness than the average of the water supplied to London; and is, in fact, water of first-rate quality. The same report contains valuable information on some poisonous plants of Jamaica, and on some plants falsely reputed to be so.

NORWAY has just received the news of the death of one of her most eminent and most enterprising Arctic voyagers, nearly a year ago. Captain Sivert Tobiesen left Tromsø on May 21, 1872, with the intention of thoroughly exploring

the northern coast of Novaja Semlja, and till now no news whatever of his success has reached his home. It appears that he spent the summer of 1872 in cruising along the west coast of Novaja Semlja, until the rapid thickening of the ice forced him to anchor on the north-east of Birch Island, and take to the boats. One party spent the winter in the south of Novaja Semlja, with some Samoyed families that they met with, and returned to Norway last summer; the other, consisting of S. Tobiesen and his son, and two sailors, remained near the ship, making constant meteorological observations, in spite of the extreme suffering and danger to which they were exposed. On February 17, 1873, the bad food and the constant distress produced a violent attack of erysipelas in Tobiesen's foot; he never rose again from his hammock, but died of scurvy, after terrible suffering, on April 29 last. After the death of his father, Jacob Tobiesen fell ill; the ship foundered, and the three men were forced to travel inland and put up a tent. Jacob Tobiesen was at last, on May 1, forced to discontinue the scientific observations which he had taken up where his father dropped them. After a struggle of extreme suffering, he died on July 5. The two survivors lived on sea-birds and their eggs, waiting for the ice to break up; they were nearly starved, and harassed by almost unceasing hail and sleet. With infinite labour they pushed the boat out into the open sea on August 9, and were so fortunate as to meet with a Russian merchantman, which brought them in October to Archangel. After long illness they have both recovered, and have just brought the news back to Norway by way of Vardö and Hammerfest.

OFFICIAL accounts from Nantes tell us that the Loire, although the largest river in France, is only navigable as far as Nantes for vessels drawing over 11½ feet or 12 feet of water. Large sums of money have been expended in making stone dykes at the most shallow "passes," with a view to create currents, and thus canalize it; but it was found that by this system the sand was merely carried to some other point where the current was less rapid, and there formed new banks or "passes." It has been several times pointed out to the local authorities that if works were carried on similar to those adopted in the Clyde, Ribble, and other English rivers, in all probability a sufficient depth of water would be obtained to enable vessels drawing 15 feet to come up to the port. Several schemes have been put forward to cut a shipcanal from Nantes to Paimbœuf, but, as with other works of public utility, nothing can or will be done unless the Government takes it in hand and pays the cost.

THE number of the *Proceedings of the Asiatic Society of Bengal* for December, 1873, contains an interesting paper, by Upendra Chandra Mukerjee, on "The Bhādu and the Bāuris." The Bāuris are the aborigines of Bānkurah and Parūlia in the province of Chutia Nāgpur, and the Bhādu is a festival which takes that name on account of its celebration in the month of Bhādra. Here we have a curious instance of the growth of a religion beneath our eyes, for the festival has not been in existence for more than twenty-five years. The lower orders, having no other idols to worship, adore, with songs, the figure of a young girl seated upon a lotus. The marriage ceremony among the Bāuris is described as follows:—

"The bride and bridegroom are placed under an artificial tree, which is specially prepared for the occasion, when a twig of the Mahwa tree, and a pot of water from a Brahman's house are brought, and the head Bāuri of the bridegroom's family then takes the twig and dips the same into a pot of water, and sprinkles the water on the heads of the bride and bridegroom; the ceremony is concluded by handing round spirits and meat. The barking of a dog at the time of the wedding is looked upon as a good omen, and some of the people present generally manage to bring in a dog, which is then beaten till the auspicious bark is heard."

CORRESPONDENCE.

HENRI REGNAULT.

April 10.

Being at Marseilles, I went to the Museum on April 9, and was much interested to find there an important work by the noble-hearted young French painter, Henri Regnault, "mort pour la patrie" (as the inscription on the frame very rightly words it) on January 19, 1871. This picture is a *Judith and Holofernes*, painted in Rome in 1869—earlier, therefore, than the *Erection in the Alhambra*, and other productions, which have conferred a not transitory fame on the name of Regnault. The tone of colour is dark and brilliant at the same time, and that very remarkable balance which one finds in other works of the painter between intensity of dramatic point of view, or crisis, and intensity of executive power, is here highly apparent. This combination seems to me one of the most marked gifts of Regnault; none, assuredly, could be a nobler pictorial possession. Holofernes is lying, stupefied but with an expression of enjoyment, on the couch in his tent; Judith, near the entrance of the tent, through some rift in which the keen dawn-light is streaming, has just grasped his sword, and stands her full height in superb consciousness of the terrible moment of attainment; her aged nurse glances boldly at her with unmistakable and unmistakable eyes. The rich yellow handkerchief

bound about the nurse's head, and the flashing scarf of gold tissue round Judith's waist, along with the fine half-tone of her flesh, dark yet pearly as well, form some of the most salient points in the rich, varied, and peculiar colour. The French know how to honour their men of genius, as shown by the housing of this striking work in the Museum at Marseilles, while two others of the same painter's oil-pictures hang on the walls of the Luxembourg in Paris.

Courbet, it is true, has been disgracefully treated by his countrymen ever since he acted on his own convictions as a member of the Commune. The Marseilles collection, however, contains a large picture of his, *Le Cerf*; and a small landscape, dark, warm, and very fine, of a village—probably in the south of France or in Spain—with a green rivulet in front, and some figures of laundresses. Among works of the old masters, one of the really remarkable specimens is a Perugino, *La Famille de la Vierge*. The Marseilles Museum—which is magnificently got up, with an astonishing fountain outside, dwarfing even (unless the eye deceives me) the Fontana di Trevi in Rome—contained in 1867, of the French school of art, 198 works; Italian, 50; Northern, 34; Spanish, 1. The additions since then are, no doubt, not inconsiderable. Provincial museums on this large scale appear to be excellent means, too little attended to in England, of promoting the interests of art: I mean provincial museums, for which the works of living artists are purchased with judgment and liberality—for no other course of action will stand in stead of that. W. M. ROSSETTI.

THE SITE OF TROY.

April 13, 1874.

I should have thought that the true site of the Homeric Troy, viz., on the high ground near Bounarbashi, had long ago been ascertained and established beyond the possibility of doubt by Sir William Gell in his once well-known, but now seldom quoted work on the *Geography of the Troad*. The only difficulty of importance arises from the passage in *Il. xx.* 216, where it is said that "Dardania was built before sacred Troy had been founded on the plain (*ἐν πεδίῳ παρὶς Ἰδῶ*), for before that time men dwelt as yet on the roots (*ῥιζαί*) of well-watered Ida." That the coast-line of the Troad has undergone extensive changes in 2,000 years, as your correspondent Mr. W. Huyshe suggests, is perfectly credible. The harbour of Megara (Nisaea), which in the time of Thucydides was an open bay (*iii.* 51), is now, as shown in Dr. Arnold's map or plan of the island Minoa, which then stood at the entrance of and commanded the bay, entirely silted up. The changes which have taken place within even two or three generations (nay, in the memory of old persons still living) on the coasts of Norfolk and Suffolk, and the rapid accretion of the sand near Yarmouth, are known to most who are acquainted with that part of the country. The so-called Fens of Cambridgeshire and Lincolnshire, which occupy the basin of an inland bay, an extension of the present "Wash," were at no remote period forests; and they became marshes still more recently. Large trees, with hearts quite solid and undecayed, are found a very few feet below the soil; and horns of red deer and wild oxen, neither of which could have lived on a fen, are dug, or even ploughed up, so fresh, that it is impossible to attribute to them any great antiquity. Therefore it is not at all unlikely that a couple of miles of alluvium have been added to the Troad within the historic period.

The Ionic poet who compiled the *Iliad* as we have it, in all probability had personally visited the site of the city he describes. My own conviction has long been, that the Homer of the age before Pericles was altogether different,—an indefinitely large series of epics on Troy and the Trojan heroes, sung by rhapsodists and not consigned to writing at all. The *materials*, so to say, of our *Iliad* are, in the main, ancient, i.e., the

vocabulary is to a large extent archaic; but I agree entirely with Mr. Harrison (Introduction to the *Catalogue of Photographs in the British Museum*, p. xxvii.) that "the books known to us under the authorship of Homer did not constitute the Homer of ancient Greece. Large portions existed before Herodotus' time, but they were not thrown into their final form much earlier than the time of Plato, who died 100 years after Herodotus." This is a doctrine which I have been labouring for years to inculcate; and I have no fear at all respecting its ultimate acceptance by all impartial lovers of truth.

Granting the immense antiquity of the human race, and of even populous cities in Asia Minor, we shall have little difficulty in conceding that Dr. Schliemann has unearthed on one of these old sites a collection of very early and very curious remains—genuine as antiquities, but having no more to do with "King Priam" or the Homeric heroes of our *Iliad* than with the Man in the Moon.

The very fact of several names existing, e.g., *Δαρδανία*, *Ἰλίου*, *Τροία*, *Τρωία*, for the supposed scene of the War, indicates that no one site was definitely assigned to it in remote antiquity. The compiler of the *Iliad*, as we have it, personally knew, as I have said, the site that he describes; and he adapted his descriptions to suit it. But the Troy, or Ilium, of the original Homeric poems, as Pindar and Aeschylus knew them—the Troy built by Apollo, Poseidon, and Aeacus—was, I take it, a purely mythical city. F. A. PALEY.

THE ETRUSCAN LANGUAGE.

Twickenham Common: April 14, 1874.

I trust you will permit me to say a few words in reply to Mr. Max Müller's two articles.

Mr. Müller says that my method is not what it ought to be. I fully admit that the method I have used is defective, but, unfortunately, it is the only method applicable. It is only possible to work from the known to the unknown. The bilinguals contain unfortunately nothing but proper names, they give no clue to the grammar. It was therefore necessary to begin with the vocabulary, and, by aid of the ten or twenty Etruscan words whose meaning is reasonably certain, to establish a presumption as to the nature of the language. Mr. Müller admits that there are ten or twelve "startling coincidences between Etruscan and Finnish words." More there could hardly be, as it is only where the meaning of an Etruscan word is independently known that a startling coincidence could be exhibited.

Mr. Müller says that he looks in vain for "anything like a minute grammatical analysis." It would, I think, have been better if, instead of making this accusation, he had passed in review the grammatical results at which I have arrived, more especially the agglutinative use of the suffix *-al-isa*, a construction which by itself goes far to establish the Altaic character of the Etruscan speech. Add to this remarkable usage the post-position of the articles and pronouns, the possessive case in *-na*, which Weske has shown to be so characteristic of the Finnish languages, the plural in *-ar*, and various participial and verbal forms, and it can hardly be affirmed that I have taken no account of grammar, which is, as Mr. Müller observes, "the mainstay of every truly scientific decipherment."

Mr. Müller finds fault with my method. With greater reason I might find fault with his. Instead of dealing with my grammatical results, he says he "looks for them in vain." Instead of grappling with that essential part of my argument which the *Times* has pronounced to be "unanswerable," he ransacks the whole book, and more especially the footnotes, for mere *obiter dicta*, matters in no way affecting the argument, for some of which other writers are responsible, most of which I have noted as "possible" illustrations to which I distinctly decline to commit myself, or which I have relegated to the footnotes as being of two

irrelevant or doubtful a nature to find any place in the text. It would not be too much to say that every one of the matters to which Mr. Müller takes exception might be struck out without in the least affecting the argument of the book.

No doubt I have made blunders; it would be marvellous if I had not; or, to use the delicate euphemism which Mr. Müller employs to characterise his own mistakes, no doubt some things will have "to be surrendered." Still, I do not think that it will be necessary to surrender everything to which Mr. Müller takes exception.

For instance, there is one statement which I have made, with regard to which Mr. Müller's language is specially unmeasured. He, therefore, probably regards it as one of his strongest points. The *usil* of the Etruscan mirrors—the *ausel* of Hesychius—meant, it is admitted, either the "rising sun" or the "dawn." On the hypothesis that the Etruscan was an Altaic language, I ventured to suggest that these well-known words could be explained by means of the Permian word *asal*, which means the "morning," instead of connecting them with the Latin *aurora*, as has been done by those who supposed the Etruscan to be an Aryan language.

Mr. Müller comes across this conjecture, and says he can "hardly believe his eyes." He thinks "no scholar could read it without shivering." In spite of this very strong language, I still venture to think that the phonetic resemblance between *usil* and *asal* is quite as close as the resemblance between *usil* and *aurora*; and I venture also to think that, if the Etruscan is an Altaic language, it is more scientific to seek for an explanation of an Etruscan word in the language of the Finnic Permians, than in that of the Aryan Latins.

The same explanation, *mutatis mutandis*, might be applied to most of the conjectures which have excited Mr. Müller's shivering horror. If there are grounds for the presumption that the Etruscan is Altaic, then words which are certainly or probably Etruscan should be explained from Altaic sources, even when there is a possible Aryan etymology.

Mr. Müller asserts that, except in the case of *Kulmu*, my examination of the Etruscan mythology gives hardly any results. I will take two cases, in which not even a plausible Aryan etymology has been suggested. The identification of the Etruscan MANIA, the "Queen of the underworld," with MANA, who in the *Kalevala* is the "Ruler of the land of the dead," seems to me to afford as close an approximation, both in sound and office, as could reasonably be expected. Again, the Etruscan TURAN, who answers to Venus Urania, may, I think, fairly be compared with the Ostiak "heaven-God" TORUM, or with TURJAN TYTHI, the "heavenly maiden" of the *Kalevala*. To go further into this subject would be to rewrite for your columns my chapter on the Etruscan mythology.

Of Mr. Müller's first notice little need be said. He begins with an exposition of the merits of his own writings on the Turanian languages. I admit that this rebuke is well deserved, as I unfortunately omitted his name from the list of eminent Turanian scholars given in my preface. Next comes a denunciation of what is described as the "Pan-Turanian" method of interpretation. With this I am not concerned, as Mr. Müller concludes by admitting that the Pan-Turanian method is not the method which I have adopted.

When, however, he proceeds to doubt whether the six words on the Dice are really numerals, then, to borrow his own phrase, "I can hardly trust my eyes." Even Pott, "that Nestor among Comparative Philologists," accepts these words as numerals without question. As far as I know, every other writer, with the possible exception of Lord Crawford, has done the same. If not numerals, it is difficult even to guess what these six words can possibly be. More than all, out of the six words upon the Dice, certainly five, probably all six, are proved independently to be numerals

by their occurrence in well-known numerical formulae, such as statements of age, and the like. Mr. Müller, in his natural anxiety to keep the field open for his friend, Professor Corssen, must be hard driven indeed to employ such a desperate argument as this.

Pott's "warning words," if they decide anything, decide that the Etruscan is not an Aryan or a Semitic speech, a dictum fatal to Professor Corssen's hypothesis that it is one of the Italic dialects. If, as Pott affirms, the Etruscan numerals are neither Aryan nor Semitic, it follows that they must be either Turanian or "the last echo of a world totally sunk into ruins." That Pott embraced the second alternative can easily be accounted for. He accepted without question Campanari's guess—for it was nothing but a guess—as to the order in which the six words on the Dice should be arranged. The inevitable conclusion, on Campanari's data, was that adopted by Pott—namely, that the numerals were a hopeless chaos. But, putting aside Campanari's guess as of no authority, and slightly rearranging the sequence of the six numerals, it is not difficult to show that the hopeless chaos gives place to manifest order, and to the exhibition of clear Turanian affinities.

In conclusion, I think I may assert that every Etruscan word and grammatical form as to the signification of which there is the slightest internal or external indication, can be explained, without any violent etymological artifices, from the resources of the Altaic family of languages. Mr. Müller admits that the "outward similarity" cannot be denied. I may also assert that persistent attempts to do this by means of Aryan and Semitic languages have conspicuously failed.

Of the shortcomings of my own book I am, as I said in my preface, fully conscious. This however is not the question at issue—the question is whether the Etruscan is, or is not, a Turanian language; and this question I confidently leave to the decision of independent scholars.

ISAAC TAYLOR.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, April 18,	1 p.m.	Sale at Christie's of Modern Pictures and Water-Colours of John Montefiore, Esq.
	3 p.m.	Crystal Palace Concert (Grieg's Concerto).
	"	New Philharmonic Concert, St. James's Hall.
	8 p.m.	First night of <i>Fair France</i> at the Queen's.
MONDAY, April 20,	10 a.m.	Annual Exhibition of Society of Painters in Water-Colours opens.
	"	Annual Exhibition of Institute of Painters in Water-Colours opens.
	1 p.m.	Sale of Modern Paintings and Water-Colours at Christie's.
	3 p.m.	Asiatic.
	8 p.m.	New Philharmonic Concert, St. James's Hall.
	"	Victoria Institute: Mr. Gose on "The Ethical Condition of Early Scandinavian Peoples."
	"	British Architects.
	"	Medical.
	"	Society of Arts: Cantor Lecture on "Carbon and certain Compounds of Carbon." (II.)
	"	Statistical.
TUESDAY, April 21,	7.45 p.m.	Civil Engineers: Renewed discussion on "The Fixed Signals of Railways."
	8 p.m.	Pathological.
	"	Anthropological: Mr. Serjeant Cox on "Hybridism;" Mr. A. L. Lewis on "The Kentish and Oxfordshire Groups of Rude Stone Monuments."
	"	Society of Arts: Mr. W. C. Aitken on "Progress recently made in Ornamental Processes connected with the Metallic and other Industries."
	8.30 p.m.	Zoological.
	WEDNESDAY, April 22,	7 p.m. London Institution: Professor H. Morley on "English Poets of the Nineteenth Century." (III.)

- WEDNESDAY, April 22, 8 p.m. Society of Arts. Archaeological.
 " Royal Society of Literature: Dr. Birdwood on "The Silver Patern sent by Dr. Lord from Badakhshān."
- THURSDAY, April 23, 2 p.m. Society of Antiquaries (Anniversary).
 " Sale by Messrs. Puttick & Simpson, of the collection of Ancient Charters, &c., of the late Mr. J. C. Hotten.
 6 p.m. Royal Society Club.
 8 p.m. Society for the Encouragement of the Fine Arts: Mr. D. Grant on "Characteristics in Art."
 8.30 p.m. Royal: Mr. A. H. Garrod on "Some Points connected with the Circulation of the Blood, arrived at from a Study of the Sphygmograph Trace;" Mr. H. Watney, note on "The Minute Anatomy of the Allimentary Canal;" Professor O. Reynolds on "The Refraction of Sound by the Atmosphere."
 12 " Antiquaries.
 Society of Arts: adjourned discussion on "Thrift as the Outdoor Relief Test."
 1 p.m. Sale at Christie's of the Holme-wood collection.
 FRIDAY, April 24, 8 p.m. Royal Institution.
 " New Shakspeare Society: Rev. F. G. Fleay on "The Authorship of *The Taming of the Shrew*, with Remarks on *Titus Andronicus*. Quекett Club.
 " Society of Arts: Dr. C. R. A. Wright on "Pyrites, a Source of Sulphur, Copper, and Iron."
 8.30 p.m. Clinical.

SCIENCE.

ROMAN INSCRIPTIONS IN BRITAIN.

Inscriptiones Britanniae Latinae. Ed. Aemilius Hübner, C. I. L. Vol. VII. (Berlin: Reimer, 1873. Folio.)

THIS is a book which ought to be in the hands of every English archaeologist, and in every public library in the British Empire. Our first feeling, on looking into it, is naturally one of regret that the author was not born on our own soil, coupled with a certain sense of shame that no competent English scholar had rendered his work unnecessary by taking the task upon himself. But this feeling disappears on reading the book more thoroughly. In the cause of philology, national pride is out of place; and it is pretty certain that no one who treated these inscriptions from an insular point of view, as our scholars naturally would, could have done the work so well as Professor Hübner, who approaches Britain as a province of the great praetorian prefecture of Gallia, which he has so long made his own. At the same time Professor Hübner renders such ample justice to English archaeologists, past and present, that we feel really grateful to him for an independent testimony, which will, it is to be hoped, have its effect on public opinion as much at home as abroad.

For our own satisfaction we may note the general statement that English antiquaries are honourably distinguished for the care with which they have preserved the original stones and other relics found in this country, and for the fidelity and truthfulness with which they have edited them; while in Germany "fraudes epigraphicae" are by no means absent (p. 6). We are bound indeed to confess that the spurious Richard of Cirencester is no credit to us, and has misled even some recent antiquarians. We are also glad to see Professor Hübner's appreciation of the labours of our numerous learned societies, and of the periodicals issued by them. "Nowhere else probably

was the power of united action discovered sooner than in Britain, or acted upon with more frequency in every department of work. Literary societies of all kinds have long flourished there, and grow daily stronger and more numerous; there is no city of any wealth, hardly any county, which has not its literary society (academia) of some sort, with its printed volumes of transactions" (p. 41). These passages are from the interesting bibliographical summary at the beginning of the book, from which a good deal may be learnt even by those not specially interested in inscriptions. The various editions of Camden are accurately discriminated, and the merits of his companion, Sir R. Cotton, are acknowledged. It is, however, rather surprising that Professor Hübner should have been the first to examine the autograph papers relating to their journey, containing several inedited inscriptions, which were open to the public in the British Museum (p. 7).

A hearty tribute of praise is accorded to the prince of British antiquaries, the author of the *Britannia Romana*, which is acknowledged to be the foundation of the present collection. John Horsley, who was a Non-conformist minister at Morpeth at the beginning of the last century, is a striking instance of the aptitude of our countrymen for archaeology, though, like too many of them, he started with a somewhat defective education. His epigraphical merits are shown by one fact amongst others that, while Camden knew of about 100 inscriptions, Horsley delineated in his plates about 340 (besides those that had been lost), 140 of which had never been published before (pp. 8, 9). Gough is also praised for the fullness and accuracy of his collections; and it is satisfactory to see an acknowledgment of the value of the Gough topographical collection in the Bodleian Library, to which continual additions are being made, so that Professor Hübner was able to find there, and to find easily, very much that he looked for in vain at the British Museum. He remarks, also, on the neglect of the earlier editors of the *thesauri* of inscriptions, Muratori, Maffei, Donati, and even Orelli, in not using the materials provided for them by native scholars.

Of recent English writers on the inscriptions of the whole island, the most prominent are Mr. C. T. Newton, of the British Museum, who completed the selection published in the *Monumenta Historica Britannica*; Mr. C. Roach Smith, in his *Collectanea Antiqua*; and Dr. John M'Caul, of Toronto, the editor of *Britanno-Roman Inscriptions with Critical Notes*, to whom, as well as to others, Professor Hübner does justice in his introduction. The merits of eminent local antiquaries, such particularly as Hodgson and Bruce, in connexion with the Roman Wall, and Wellbeloved and Kenrick at York, are also fully recognised. It is further very pleasant to notice the acknowledgment of such constant personal kindness and assistance, which is not only to the credit of our national hospitality, but is at the same time a proof of the happy absence of professional jealousy amongst our antiquarians. Those who have the pleasure of knowing Professor Hübner personally will easily conceive that

it was equally agreeable to his hosts and correspondents to assist him.

It would be impossible, in an article like the present, to do justice to the very varied subjects discussed in this book with so much vigour, fulness, and good sense. A final judgment on such a work must be a matter of time; but, as far as a judgment can be formed at once, it appears to be as perfect as a book of this kind can be—a monument of patience, learning, and skill, which may bear comparison with the best work of any age. We shall probably best consult the interests of our readers by giving some account of Professor Hübner's conclusions on the general state of the province under the Romans, and on the vexed question of the Roman Wall, adding a few remarks of our own.

1. Britain, which was twice invaded with slight results by Caesar, was first made a province by Claudius, whose army seems to have gained a victory under the Mendip hills (cp. the leaden trophy, no. 1201). It was first really subdued by Agricola in the reign of Nero, but of his expeditions we learn nothing from inscriptions. The Roman power was naturally established earlier in the south than in the north, Colchester (Camalodunum, Colonia Victrix) and London being probably the capitals of the province, while Chichester (Regnum) and Bath (Aquae Solis) were very early stations, giving us inscriptions of the first century. York does not appear to have become the seat of government till the time of Trajan.

The construction of the great work of Hadrian from the Solway to the Tyne, some way south of the lines on which Agricola had established fortifications, ensured the country to the south from attacks of the uncivilised nations to the north, and formed a permanent position, from which the conquered tribes of the neighbourhood, who had recently revolted, could be kept in order. The vallum of Antoninus Pius, between the Clyde and the Forth, must have been very much upon the same ground as the lines of Agricola. To the end of the second century we must ascribe the occupation of Wales, as far as it was carried out, the principal stations being Isca (Caerleon-on-Usk), Deva (Chester), and Segontium (Carnarvon), where inscriptions of this date are found. Inscriptions of the later emperors and usurpers who had a special connection with Britain are comparatively few, and there are none referring to Carausius and Allectus, peculiarly British emperors, whose coins are frequent. The last emperors of whom we have any distinct trace are Constantine and his sons Crispus, Constantine, and Constans, and these only on milestones. Considering the early association of this island with Constantine, we can only conclude that we have in these inscriptions a very precarious material for judging of the history of our country.

The island of Britain was at first a single province, imperial not senatorial, and governed as such by a consular legate, with a procurator under him. After the sedition of Albinus it was divided into an upper and lower province by Septimius Severus, according to a statement of Herodian, which is supported by three inscriptions (nos. 280, 281, and one in Algeria). Their boundaries

however, cannot be defined. The further partition carried out by Diocletian into four, to which a fifth (Valentia) was added in the reign of Valens, makes little appearance in history, and none in inscriptions.

On looking at the capital map of Roman Britain contained in this volume we can almost fancy we have before us a sketch map of the various lines of railway, so nearly do they coincide with the direct courses of the ancient roads. Scarcely any important district was left untraversed, though the south and east was naturally more civilised than the remoter districts. Of the extent to which Roman rule penetrated beneath the surface we have little means of judging. Professor Hübner agrees with our most learned native historians in thinking that it did not go much beyond military occupation (Cp. Mr. Stubbs' recently published *Constitutional History*, vol. i., pp. 60-62). We know the names of a few colonies almost by chance, but we have little trace of civil and social life in these inscriptions, and there is, perhaps, no evidence at all of a continuous municipal tradition such as exists in the neighbouring province of Gaul.

The disposition of the troops can be much more readily described. Four legions were sent by Claudius to subdue the province, the second, ninth, fourteenth, and twentieth, and the first and last of these were permanently quartered in Britain, and usually at Caerleon and Chester respectively. The ninth, which was quartered at York, was destroyed in the reign of Trajan, and was succeeded by the sixth (*victrix*), of which we have so many traces in the North of England. The fourteenth, which perhaps was quartered at Colchester, was withdrawn to quell the rising of Julius Civilis, in Belgium, and remained in Upper Germany. With some slight changes the second (*Augusta*), the sixth, and the twentieth (*Valeria victrix*) formed the permanent army stationed in these islands. The number of auxiliary and other troops was also large, and certain detachments seem to have been pretty constantly in the same place. A full account of them may be gathered from the excellent index.

As a general rule, the Romans controlled the provincials of one country by soldiers drawn from another; and while Britain was garrisoned by Germans, Gauls, Spaniards, Lusitanians, Dalmatians, and Pannonians, British auxiliaries were stationed in Egypt, Armenia, Illyricum, and Spain. The poet Juvenal, it may be remarked, belonged to the first cohort of Dalmatians, of whom we find traces at Uxellodunum (Ellenborough, no. 367, cp. 387), and may have drawn his advice "dirue Maurorum attegias castella Brigantum," from actual service. We know, however, from Tacitus, that Britons were to be found serving under Agricola (Calgacus' speech, ch. xxxi., xxxii.); and we find traces of Dumnonians, or west-country folk, and Catuvellauni from the midland counties, who seem to have been enlisted to help in building the wall. (Nos. 775, 776, "*civitas Dumnoniorum*," or "*Dumni (onorum)*," near Thirlwall Castle, and 863, "*civitate Catuvellaunorum Tossodio*," at Howgill.) An epitaph found at Mumerills, on the vallum of Antoninus, also proves that the foreign cohorts

were sometimes filled up with natives, since it commemorates a man "*nationis Brigantis*," who served "*in coh(orte) II Thr(acum)*." We have further three cohorts, I., III., and IV. (*Br(ittorum?)*), mentioned upon military tiles, &c., found in the north of England. While on the subject of the army, it may interest some of our readers to know that regular surgeons were attached to the different divisions. We have the epitaph of a *medicus ordinarius* of the first cohort of Tungrians (no. 690), and of a *medicus duplicarius* erected by his colleagues (no. 1144). For further details we are referred to Noel des Vergers' *Marc-Aurèle*, p. 69, foll. Paris, 1860, 8vo. Similar inscriptions are to be found in the 5th volume of the *Corpus*, and in Wilmanns, nos. 1499 and 2490.

2. The Roman Vallum from Bowness, on the west of Carlisle, to Wallsend, on the east of Newcastle, is in some respects the most classic ground in England, and no account of this book would be even moderately complete without reference to it. Those of our readers who wish to form a lively idea of this great work should turn to Dean Merivale's vigorous article in the *Quarterly Review* (vol. cvii., for 1860), a paper to which Professor Hübner might have made more explicit reference. Those who have time for details will, of course, supplement Professor Hübner's account with the fuller statements of Dr. Bruce's excellent book (which reached a third edition in 1867), and with those that appear from time to time in the publications of the Society of Antiquaries of Newcastle. This part of England has been extremely fortunate in the public spirit shown by the landed proprietors from the Duke of Northumberland downwards, and in the zeal and learning of its archaeologists. The noble relic over which they have watched so sedulously represents a very elaborate system of fortification. It consisted, as is well known, of two great chains, the first a massive stone wall to the north, strengthened by a ditch where it is not sufficiently guarded by a natural cliff, and nearly parallel to it, to the south, a line of three mounds, with one deep ditch between the two nearest the wall. The wall itself takes always the highest ground, in which it is followed by the ancient *via vallaris*, while the mounds traverse the lower slopes, and avoid difficulties, so that they sometimes, especially towards the middle of their course, are nearly half a mile distant from the wall. The wall was strengthened by about 320 square towers ten feet each way; and at distances of a Roman mile were about eighty small forts or castles sixty feet each way in the interior. The larger stations or *praetenturae* (no. 634, cp. Ammian. xiv. 2, 4) are now proved to have been seventeen in number, and lay between the wall and the lines of earthworks. They are of the form of a Roman camp walled with stone, and contain from three to six acres of ground.

The chief controversy with regard to this grand work is naturally, who was the builder of it? There is ancient authority both for Hadrian and Severus, but the historical information is scanty, though sufficient to provide material for an amicable feud between the antiquaries of the two counties. The Cum-

brians make a stand for Severus, while the Northumbrians, under stronger leadership, assert the claims of Hadrian. Another story was long current, drawn from Gildas, Nennius, and Bede, which ascribed the wall, as distinct from the earthworks, to a later date, to Carausius, for example, or to the Britons deserted by the Roman legions. This has been revived by Dean Merivale as an hypothesis, possible at least in some form, and has been accepted by Mr. C. H. Pearson (*Early and Middle Ages of England*, vol. i., p. 63, note). It is, however, rejected most distinctly by Professor Hübner, and probably with justice, the chief argument being that the whole work shows a single design and execution.

The rival claims of the two Emperors are less easy to settle, but the Professor shows himself a decided Aelian, and thinks that Severus was only named as the builder out of flattery. The argument rests chiefly upon the inscriptions found in the mile castles, *i.e.*, part of the work of the wall itself (nos. 660-663), which seem intended to record the work done by the second legion. No. 660, for example, runs as follows:—IMP. CAES. TRAIAN. | HADRIANI (sic) AVG | LEG. II. AVG | A. PLATORIO. NEPOTE. LEG. PR. PR. There are others of the same kind, particularly a tantalizing fragment at Segedunum (Wallsend, no. 498), which probably commemorated the occasion on which the vallum was built. Those who doubt that such works as the stone wall were erected by the Romans, will be interested in reading the quotation from the allocation, probably delivered by Hadrian himself, to the cavalry soldiers of the 6th Commagene cohort in Africa, in which they are praised for the speed with which they have built a long wall of this kind of large and unequal stones, and dug a trench through hard and rough gravel (*Renier: Inscr. de l'Algérie*, no. 5 D, quoted at p. 100, Wilmanns, no. 1519).

3. We have perhaps sufficiently indicated the sort of interest attaching to this book. There are many other subjects touched by it which we ought to mention if our space allowed—such as the light thrown on the religion, trade and commerce of our ancestors. For these matters, however, it will be best to await the natural complement of this volume, the inscriptions of Gaul and Germany. Professor Hübner laments in his short preface that the *vicissitudines temporum* have prevented them from being published together, and no doubt he is right in doing so. At the same time it is to be hoped he will have some consolation in finding a larger demand for the present volume in England. Few country gentlemen, we might almost say few country clergymen, are content without having the Doomsday, the local histories, and the ordnance maps of their county or district. We hope that they will feel it equally incumbent upon them to procure this volume, which they can purchase for a smaller sum (32s.) than that at which any of the better county histories are sold. Any one who took the pains to study it carefully, and to look for further illustrations in the accurate selection of inscriptions recently published by Wilmanns, would feel that he had a real and solid basis of epigraphical know-

ledge which it is to be feared a good many would-be archaeologists do not possess. In fact, an exact comparative study of Roman inscriptions is a creation of the present generation of Latin scholars, of whom the editors of the *Corpus* are among the most prominent.

There remains, indeed, a good deal to be done in respect of our national antiquities, particularly in editing the Christian inscriptions of Wales, for which we are glad to see that Mr. Rhys, of Merton College, has made some collections. There may, again, be still considerable discoveries of Roman remains. Canon Raine, of York, has been kind enough to furnish us with the following notice of an epitaph recently discovered at York in a cemetery of some extent. Only two inscribed stones have been found, one of which Professor Hübner gives in this volume, no. 1343, p. 307. The other seems to read, according to Mr. Raine's letter:—

D. M.
FLIVIBELLATORIS DEC COL EBORACEN.
VIXIT ANNIS XXVIII MEN

"The letters are badly cut," he writes, "and the surface of the stone has crumbled away very much. As to *Vibellatoris* I am in some doubt. The last six letters are quite plain. This cemetery was unknown for the most part before. We knew of two others for a richer class of persons, each stretching for more than a mile from the present walls of the city."

The importance of this inscription is evident, as adding another instance of a municipal officer to the few already known in Britain. We have a *IIIIVIR COL. EBOR.* No. 248, that is to say a *Sevir*, or member of the college devoted to the worship of Augustus and other emperors; but this is the first decurion of whom we know anything in this place, once the capital of the whole island. The only others known are those of Lindum (probably) and Glevum (nos. 54 and 189), while there is perhaps no relic on inscriptions of the municipality of London.

It may be as well to add here another inscription which I met with in North Wales last summer at Llanfihangel-y-Trac-thau (S. Michael of the Estuaries), on the coast of Merionethshire, about four miles north of Harlech. The churchyard is known to contain stones with late Christian inscriptions, but recently, in repairing the tower or the roof, the workmen had found an inscribed stone of peculiar shape, which had been inserted into the fabric of the church. My attention was called to this by the rector, by whose courtesy I was enabled to copy it. It was a block of about twenty-two inches long, three-sided, and inscribed at both of the triangular ends, and on two of the sides. On one of the ends and one side were Latin inscriptions, and on the other side and end Welsh. The Welsh inscription was comparatively modern, probably of the same date as that cut upon the end, *MAI 16 | 1679*; it ended with the words *wyf mewn heddwch*, "I am in peace," but was difficult to decipher throughout. The Latin inscription was very curious. The triangular end seemed to have been used for a double purpose. Towards the apex were four letters, one of which might possibly have been an *M*, with three others

beneath it, which I took for *IMP* with a broader *m*. These three were scored through, and then came in apparently later characters, *DOMVS | MEA | SEPVLCHRVM*, and underneath them another line scored. There were the usual "nexus litterarum," and the *m*'s were of a later shape, *M*. On the side was a pentameter line in similar characters, which was certainly to be read—

ipse. iVBET. MORTIS. TE. ME | MINISSE. DEVS +
though the letters were somewhat indistinct, and the slab was broken in half by being thrown from a height. Of the cross I have a clear recollection, and it seems apparent in a rubbing which we made upon the spot. One of the friends who were with me at the time, and who assisted me in deciphering the stone (Mr. W. Heslop, of Brasenose), has since pointed out that the pentameter is a line of Martial, from the epigram describing the little dining-room built by Domitian so as to have a view of the mausoleum of Augustus, and that *deus* there is the dead Emperor (Martial, ii. 59).

"Mica vocor; quid sim cernis, cenatio parva:
Ex me Caesareum prospicis ecce tholus.
Frangere toros, pete vina, rosas cape, tingere nardo:
Ipse iubet mortis te meminisse deus."

Curious as the fact is, it is evidence of some culture, if of no very good taste, in the Christian who erected the tomb. The letters erased at the triangular end are also extremely puzzling; one is tempted to question whether they formed part of the legend of a milestone. But were milestones ever inscribed upon the end? Or could it have been a boundary stone, some of which we know were so inscribed? This is not the place to discuss the matter further, but it may be hoped that Professor Hübner will be good enough to give us his opinion on the matter.

The only other contribution I can offer is the name *BIRGA*. | vs from a tile which I saw some years ago at Silchester, together with the one numbered 1259 in this collection. The only name at all like it (and that is sufficiently unlike) is *BIR. AGILLI*, no. 1336, 155.

In future editions of this book, as well as in later volumes of the series, we hope that the editors will add to their excellent indices (1) a list of the names of places, ancient and modern, where inscriptions are found; (2) a list of the rarer words, *e. g.*, in this book, to name only the first instances that occur, *seria* is a *ἀπαξ λεγόμενον* for *series* (no. 39), and so perhaps is *possuit* for *posuit* (no. 656).

JOHN WORDSWORTH.

Responsibility in Mental Disease. By Henry Maudsley, M.D., F.R.C.P. "The International Scientific Series," No. VIII. (London: Henry S. King & Co., 1874.)

THE publishers of the International Scientific Series have made a wise choice of subject in selecting the question of *Responsibility in Mental Disease* for one of the volumes, and Dr. Maudsley has most ably executed the trust committed to him. This volume contains, in a clear and popular form, the results of all the most recent investigations into the nature of insanity and its presumed criminal manifestations; subjects which Dr. Maudsley

has already handled in their professional aspects in his Croonian Lectures* for 1870.

There are in this Essay two points, which Dr. Maudsley illustrates with great knowledge, in relation to responsibility in mental disease. The first is, that there is no fixed line of demarcation between sanity and insanity; and that on the borderland of the insane temperament are to be found various forms of morbid mental manifestations, lessening or removing legal responsibility. The second is that insanity comprises several forms of mental derangement, with their premonitory symptoms, variations, and course, all of which must be familiar to those who would determine the existence of responsibility in any disputed case of criminal conduct. Such knowledge, as Dr. Maudsley most truly says, the law of England does not possess, and hence it is notorious that the acquittal or conviction of a prisoner, when insanity is alleged, is little better than a matter of chance.

"Were the issue," he says, "to be decided by the tossing up a shilling, instead of by the grave procedure of a trial in court, it could hardly be more uncertain. The less insane person sometimes escapes, while the more insane person is sometimes hanged; one man labouring under a particular form of derangement is acquitted at one trial, while another having an exactly similar form of derangement is convicted at another trial. No one will be found to uphold this state of things as satisfactory, although there is great difference of opinion as to the cause of the uncertainty; the lawyers asserting that it is owing to the fanciful theories of medical men, who never fail to find insanity where they earnestly look for it; the latter protesting that it is owing to the unjust and absurd criterion of responsibility which is sanctioned by the law. Meanwhile it is plain that under the present system the judge does actually withdraw from the consideration of the jury some of the essential facts, by laying down authoritatively a rule of law which prejudices them; the medical men testify to facts of their observation in a matter in which they alone have adequate opportunity of observation; the judge, instead of submitting these facts to the jury for them to come to a verdict upon, repudiates them by the authority of a so-called rule of law, which is not rightly law, but is really false inference founded on insufficient observation."

Dr. Maudsley's introductory and second chapters (the "Border Land") are very able and instructive, and place before his readers in a popular form the researches into the relations of morbid, nervous, and mental phenomena of Morel and Griesinger, which, in their application to practical medicine, are skilfully worked out by Dr. Anstie in his recent work on Neuralgia. The symptoms of the *insane neurosis* in the hereditary forms of eccentricity allied to genius, and in those painful instances of the same temperament chiefly characterised by an entire absence of the moral sense, and again in the course of the degeneracy of race leading through hereditary antecedents to crime and insanity, all tend to widen our views and soften our judgments on the moral responsibility of those thus born to disease and crime. "Bless not thyself only," says the author of the *Religio Medici*, "that thou wert born in Athens; but, among thy multiplied acknow-

* *Body and Mind, &c.* Second Edition, enlarged. Macmillan & Co., 1873.)

ledgments, lift up one hand to heaven that thou wert born of honest parents, that modesty, humility, and veracity lay in the same egg, and came into the world with thee. From such foundations thou mayst be happy in a virtuous precocity, and make an early and long walk in goodness; so mayst thou more naturally feel the contrariety of vice unto nature, and resist secure by the antidote of thy temper."

Those who have made criminals their study * dwell on the intimate relations between insanity and crime, and Mr. Thomson, the surgeon of the General Prison at Perth, sums up the result of many years' experience of the criminal population of Scotland with the terse remark that "crime is so nearly allied to insanity as to be chiefly a psychological study." Habitual criminals, according to Mr. Thomson, are without moral sense, true moral imbeciles; and Dr. Maudsley forcibly observes:—

"Crime is not then in all cases a simple affair of yielding to an evil impulse or a vicious passion, which might be checked were ordinary control exercised; it is clearly sometimes the result of an actual neurosis which has close relations of nature and descent to other neuroses, especially the epileptic and the insane neuroses; and this neurosis is the physical result of physiological laws of production and evolution. No wonder that the criminal psychosis, which is the mental side of the neurosis, is for the most part an intractable malady, punishment being of no avail to produce a permanent reformation."

Allied to the study of the insane temperament is the relation which the moral sense bears to physical organisation. Observation of the insane compels the conclusion that descendants of insane parents are often entirely devoid of moral sense. Again, an attack of epilepsy produces the most striking change in the moral character of the patient, both before and after the fit. So also a severe attack of insanity, from which the reason entirely recovers, leaves often a permanent change of the moral powers which those who know the sufferer best most fully realise, while the earliest symptom of coming insanity is sometimes a deadening or complete perversion of the moral sense. "The last acquired faculty in the progress of human evolution"—as Dr. Maudsley calls it—the moral sense or conscience, is the first to suffer when disease invades the mental organisation.

The second point in Dr. Maudsley's essay to which we have referred as deserving of study in relation to the question of Responsibility in Mental Disease, is that insanity is not—as the law of England still regards it—a single disease, but consists of several distinct varieties. Chapters iii., v., vi., vii., and viii. are devoted to the analogies and illustration of the different forms of mental disease. The first distinction drawn is between idiocy or imbecility and insanity proper. So far the law and science are in accordance.

The manifold varieties of insanity proper are divided into two classes, according to the presence or absence of palpable intellectual derangement. The first division consists of all those cases where there is insanity of

thought, or insanity with delusion, and may be described as intellectual or ideational insanity; the second division consists of all those cases in which, without delusion or incoherence, there is insanity of feeling and action, and may be properly described as affective insanity. The law of England absolutely refuses to acknowledge the existence of the latter division, and all its definitions of mental disease are drawn from a study of the first division only.

It is not consistent with the limits of this notice to follow Dr. Maudsley in his analysis and description of the several varieties of insanity comprised in the two divisions of intellectual and affective insanity in their relations to criminal responsibility. His chief attention is, of course, given to the several forms of partial insanity as those on which chiefly questions arise in relation to responsibility in mental disease.

Dr. Maudsley concludes his essay with a very interesting chapter on the "Prevention of Insanity." The volume is altogether one of the best of the International Scientific Series which has yet appeared, and will add to its author's high literary reputation.

C. LOCKHART ROBERTSON.

RECENT DISCOVERIES IN MINUTE LIFE.

It seems as if microscopists are not likely to solve the question of the origin of minute life by the modes of investigation hitherto employed. The precautions necessary to ensure the rigid exclusion of germs demand so much care and manipulative skill, that little confidence can be placed in the statements of any experimenters who are not well known to be capable of conducting very delicate analyses with rigid accuracy. It was Pasteur's reputation for great nicety in manipulation that caused his researches to be received with so much confidence, and though he cannot be considered to have fully proved his position that life never appears in solutions that have been completely freed from living organisms and germs, unless fresh organisms, or germs, are imported from without, his numerous demonstrations on the negative side must have great weight. The difficulty of excluding all germs is exceedingly great, and the progress of investigation leads to the belief that they may exist in considerable quantities without being visible under any magnification that can be employed. Even superheating fluids to destroy the vitality of any objects they may contain often fails to yield convincing results, for if life should subsequently appear to have originated in them, there will be doubts whether every particle in the vessel employed has been sufficiently exposed to a life-destroying temperature; while if no life should appear, the heterogenists will maintain that the superheated fluids may have been sufficiently changed to be unfit for the development of living forms.

One mode of conducting experiments on minute life consists in selecting an appropriate fluid, and isolating a small portion of it under conditions that enable it to be closely watched with high powers of the microscope, and all the changes noticed as they occur. This method has been recently adopted by Mr. W. H. Dallinger and Dr. Drysdale, who communicated their plans and results to the Royal Microscopical Society, in whose Transactions they are published.* The fluid they selected was obtained by macerating cod's head in water, a small portion of which they kept in a "moist chamber," modified from similar apparatus

used by previous experimenters, and the powers employed included Powell and Lealand's splendid series $\frac{1}{8}$, $\frac{1}{12}$, $\frac{1}{16}$, $\frac{1}{20}$, and $\frac{1}{30}$ objectives.

When first examined, this cod's-head fluid contained a number of small cercomonads, some with a flagellum or whip at each end, some with two whips at one end and one at the other, and others with two at one end only. They soon saw these creatures multiplying by fission in a way common with animalcules. This mode of increase might be seen without change for a week or so, and would easily be taken for the only mode in which the object was multiplied, and its race preserved; but when sufficiently watched some would at last be seen to pour out lateral sarcode masses, changing their shape, after which they moved like amoebae with pseudopodia. Pairs of these modified forms approached, coalesced, and gradually fused together in one rounded and encysted mass. These changes were watched by the two observers with most commendable pertinacity, under a magnification of 2,500 diameters. At last they had the satisfaction of seeing a cyst burst and scatter a vast multitude of inconceivably small granules. With the $\frac{1}{30}$ objective, a Beye-piece, and eight inches of draw-tube, these granules still appeared so small that drawings representing them with extremely fine dots are described as only "diagrammatic." The field was now watched for nine hours without intermission. In six hours the germinal particles had grown considerably, and in three more the parent forms were reproduced.

It was found that the adult monads were destroyed by a dry heat of 121° C. (nearly 282° F.), but some of the minute germs apparently survived. When a temperature of 66° C. (150·8° F.) was given to the infusion, the adult forms perished, but the germs resisted 127° C. (262·6° F.).

A similar set of investigations by the same observers related to a somewhat different monad that rarely appeared in the cod's-head maceration under two or three months. This creature is egg-shaped, about $\frac{1}{3000}$ inch long, and furnished with two flagella, one enabling it to anchor itself and spring backwards or forwards somewhat like, but quicker than vorticella. It multiplies by transverse, and more rarely by longitudinal fission, and out of enormous numbers a few appear of rather larger size, and swimming freely. "These become still—for a time amoeboid—then round; a small cone of sarcode shoots out, dividing and increasing into another pair of flagella. The disk splits, each side becomes possessed of a nuclear body, and two well-formed monads are set free. These swim freely until they attach themselves to an ordinary form that has just completed fission, so that the nuclei are approximate. Sarcode and nuclei melt into each other; the form becomes free-swimming, and triangular in shape; rests; loses its flagella; becomes clear and distended; then bursts at the angles, pouring out indescribably minute granules, from which myriads of new forms arise and repeat the cycle." When first emitted these granules were so exceedingly small that the high power used could only indicate their presence. They could not be said to be properly seen, any more than a distant object can be considered as seen through a telescope that completely fails to show what it is, and merely indicates the presence of something that causes an optical effect. One hour after emission the granules had grown sufficiently to exhibit minute irregular discs under the $\frac{1}{50}$ objective and C eye-piece. In two hours more they had increased considerably, and in five hours they assumed the original pear-shaped form, though on a very small scale.

Still more remarkable were some of the facts relating to another monad found in the same fluid in an advanced stage of decomposition. It varies in long diameter from $\frac{1}{5000}$ to $\frac{1}{4000}$ inch, and has two flagella, one permanently hooked, and the other flowing in graceful curves. It moves in jerks by means of the hooked flagellum. Like the

* *The Hereditary Nature of Crime*, by J. B. Thomson, I.R.C.S. (*Journal of Mental Science*, January 1870.)

* *Monthly Journal of Microscopical Science*, Nos. Ivi., lx., lxi., lxii., lxiii.

preceding form, this one multiplied by fission, but after some days' continuous observation, one was seen to attach itself to another, and the bigger one absorbed the contents of the smaller. At first the combined monad was flabby and irregular in shape, but it became rapidly distended and spherical. Minute openings then appeared at opposite points, and a faint line connected them. Five minutes later, similar appearances were observed at right angles to the former, and others followed them at equal distances. The segmentation then proceeded in directions crossing the radii, and the creature presented an aspect analogous to that of *Volvox globator*. In the course of three hours the whole cell-contents had broken up into multitudes of minute oval bodies in constant motion, and these were set free as tailed monads by splitting of the cell wall. Sometimes, instead of two monads uniting to produce these changes, three, four, and even six, coalesced.

The life history of another monad discovered by the experimenters is perhaps still more curious. This form was never seen to exceed $\frac{1}{4000}$ inch in its longest diameter. It was whiter than the former kinds, and moved slowly and uniformly with a single flagellum. This kind passes from the pear-shaped to a globular form, loses its flagellum, and becomes suddenly marked like a cross-bun, after which various curvilinear strictures appear, and the whole breaks up into a multitude of young ones, which assume the original parent form.

Occasionally some larger and plumper than the rest appeared, and fastened themselves on ordinary forms, which they absorbed, as mentioned in a previous instance, but the result was different. After the absorption of the little one, the larger monad became sluggish, and in from two to six hours settled down as a flattened globe. The next step was the bursting of the globe, and the discharge of a glairy-looking fluid in which the highest magnification gave no indications of granules. In seven hours extremely minute yellowish dots appeared, grew larger, and gradually developed into the parent forms. Considering that a magnification up to 5,000 linear, obtained by means of the most perfect objective that has yet been produced, could show no specks or granules in the fluid emitted by the bursting globe, and that the fluid itself was only visible by differing in refraction from that into which it was poured, just as strong spirit shows itself when poured into water, we may be certain that myriads of life germs may exist without being susceptible of direct discovery by any means microscopists possess.

In the whole of the experiments detailed, no care was taken to exclude external germs. All attention was given to keeping certain objects constantly in view until the whole series of their life-changes had been exhausted. This method requires great perseverance, and the co-operation of at least two observers. With regard to the heat-resisting power of the minute "sporules," some were found capable of development after exposure to a temperature of 148.88° C., and the invisible sporules "appear to have had slightly the advantage in the contest with heat."

In this brief account of a series of papers, only the salient points have been selected. The originals bear ample testimony to the skill with which the observations were conducted, and supply an important body of novel facts. No previous observers had traced sexual generation down to such minute organisms; the process of multiple fission in one of the monads presents interesting peculiarities; and, lastly, the demonstration that germinating power may exist in a fluid matter in which no granules can be discovered, and which can be dried and exposed to 300° F. without destroying its vitalising properties, gives rise to reflections that may considerably modify notions of minute life.

HENRY J. SLACK.

NOTES AND NEWS.

MR. MULDER BOSGOED, of Rotterdam, has just published at Haarlem an elaborate *Bibliotheca Ichthyologica et Piscatoria*, or Catalogue of Books and other writings on the Natural History of Fish, on Pisciculture, and on Fisheries. This valuable bibliographical work forms a handsome octavo volume of 474 pages.

In the new number of the *Archives du Musée Teyler* of Haarlem (vol. iii. fasc. 3), Mons. T. C. Winkler gives an anatomical account of the *Plesiosaurus Dolichodeirus* (Conyb.) in the Museum, with a fine folding plate of the skeleton of the animal.

DR. CARL HORNSTEIN, the Director of the Bohemian Observatory at Prague, has just printed his *Magnetical and Meteorological Observations for 1872*. This thirty-third annual volume is larger in form, but has fewer pages, than the previous volumes.

THE *Cape Catalogue of 1150 Stars for 1860*, which has just arrived in this country, has occupied Mr. E. J. Stone's chief thoughts during the three years he has been Her Majesty's Astronomer at the Cape. It is the first Catalogue of Stars ever printed at the Cape, and is a very creditable specimen of Messrs. Saul Solomon & Co.'s press. It appears that the latitude of the Observatory is still a matter of uncertainty to the extent of half a second.

MR. E. T. LOISEAU read a paper on "Artificial Fuel" before the Franklin Institute of Philadelphia, on January 21, in which he gave a full account of the attempts that have been made at various times to utilise coal dust, &c., and of the patents that have been obtained for this purpose. It appears, from a table given by Mr. Loiseau, that the loss of life among the colliers of Great Britain from 1808 to 1872 has been at the rate of one death to every 100,000 tons of coals raised.

A NEW SOCIETY has recently been founded in New York for the study of two special branches of medical science. The Society of Neurology and Electrology held their first meeting on January 21, in the hall of the New York College of Physicians and Surgeons.

A CHAIR of Psychiatry (or Medical Psychology) is about to be established at the University of Leipzig, and the sum of 250,000 thalers is to be devoted to this purpose.

THE *New York Medical Journal* for March notices—as the latest invention for the benefit of sufferers from chronic bronchitis and allied maladies—a candle, containing certain balsams and resins, which, when burned, renders the air fragrant and soothing to the lungs.

The Temperature of the Skin in Man.—Dr. E. Hankel (*Archiv. d. Heilkunde*, B. xiv. H. ii.) has made a series of examinations of the temperature of the skin under various circumstances with an extremely delicate thermo-electric apparatus, and has arrived at the following conclusions:—1. During mental activity the temperature of the skin of the head does not undergo any noticeable change. 2. During muscular action, whether the contraction be continuous or interrupted, the temperature of the skin over the contracting muscle undergoes distinct depression, but immediately rises again, and to a not inconsiderable amount. Hankel explains the primary sinking by supposing that the muscle during action draws blood to itself from the adjoining parts, and hence, by causing anaemia of the skin, lowers its temperature. 3. When sweating takes place, or even shortly before, the temperature of the skin rises, and remains exalted as long as sweating takes place in any considerable degree.

Reproduction of one of the Anterior Members of the Axolotl and Newt after Removal.—M. Legros has lately (February 7, 1874) communicated to

the Society of Biology, through M. Onimus, the results of his experiments on the reproduction of the members of the newt, and from these it would appear that the anterior members of the newt can be reproduced even when the whole of the basal or proximal part has been removed. M. Vulpian, however, denied the possibility of this taking place, providing the whole of the limb be removed, and exhibited before the society three newts whose right anterior limb he removed completely five years ago, and an axolotl whose extremity he had removed as long as eight years ago; in none of these cases had there been any budding from the wound, though the animals had been well nourished, and he therefore maintained that M. Legros could not have effected the complete removal of the limb.

Physiological Researches in Russia.—The last part of Pflüger's *Archiv*, 1874, contains a report of the papers read at the fourth meeting of the Russian Society for the Advancement of Natural Science, held at Kasan, the most important of which papers are the following:—

1. "The Amount of Fat contained in the Milk of the Human Female." Dr. A. Schukowsky, of Moscow, who had large opportunities of investigation at his command, found that the amount of fat contained in the milk of healthy women, confined within a month previously, was 3 per cent. A diminution of this amount only occurred when the woman was out of order, or had been unable to obtain a sufficient amount of food. In such cases the amount might be diminished to 0.86 per cent.

2. "The Mechanics of the Movement of the Bile." Professor Kowalewsky, of Kasan, described the results of a series of experiments he had made to determine the relation between the forces driving onward the bile, and the resistance the bile experienced in its passage towards the intestinal canal. In this investigation the maximum pressure exerted against the walls of the bile ducts, when ligatured, on the one hand, and on the other the maximum pressure ordinarily exerted by the bile during its passage, was estimated by a manometer. The results obtained were as follows, the animals being for the most part cats submitted to the influence of woarara:—1. The motor power driving the bile is not a constant force either in different animals or in the same animal at different times. The pressure varies in woararized cats, after ligation of the duct, between 12 and 20 mm. of mercury. 2. These variations depend on the blood pressure in the larger arteries; so that when the pressure rises in the larger arteries it is increased also in the biliary ducts. A certain space of time, however, elapses between the two events, and the latter is therefore not the immediate consequence of the former, but depends upon an alteration in the activity with which the secretion is formed, or upon its reabsorption from the biliary ducts. 3. The amount of the resistance to the outflow of the bile into the intestine, under ordinary conditions, presents variations even in the same animal, differing, for example, in curarized cats from 3.4 to 7.5 mm. of mercury. 4. But if now the amount of the pressure under which the bile is forced onwards is compared with the resistance that it meets with, it will be immediately seen that a permanent arrest of its movement, or a retrogressive absorption, is out of the question under any physiological condition, though it is quite possible that the flow of the bile into the intestine may be stopped until the pressure against the walls of the biliary ducts amounts to a height of from 3.4—7.5 mm. Hg. As soon as the latter height is reached the bile must begin to enter the intestine *guttatim*. This must frequently occur in fasting animals, in whom the gall-bladder is often found quite full. We are thus enabled to afford some explanation of the remarkable difference that frequently exists in the composition of the bile in the gall-bladder, and that freshly obtained from the animal, since, when the gall-bladder has been completely filled, the bile

which is subsequently secreted must be discharged directly into the intestine, without entering the gall-bladder at all. It may be mentioned that Dr. Bogoljubow has found that, in respect to the gases alone, whilst freshly-secreted bile may contain as much as 64 per cent. of combined, and 7 per cent. of free carbonic acid, the amount contained in bile in the gall-bladder of fasting animals may not exceed 2 per cent. of the combined gas and 2 per cent. free.

3. Dr. A. Troitzky, of Kasan, made a communication upon the "Mode of estimating and registering the Rapidity with which Excitation is propagated in the Nerves of Frogs at different degrees of Temperature and with various strength of exciting Currents." A description of the modification in the ordinary myographion he has found useful was given, and the following results were stated to have been obtained with feeble currents, the temperature at which the maximum rapidity of propagation of the stimulus in the nerves lies between $+20^{\circ}$ and $+10^{\circ}$ C. The rapidity falls if the nerve is warmed to 30° C. or lowered in temperature to 0° C. With strong currents the influence of temperature upon the conductivity of the nerves diminishes. The rapidity depends more upon the strength of the exciting current than upon the temperature; with very strong currents the influence of temperature is abolished. The rapidity of conduction depends upon the strength of the stimulus, and stands in direct relation to it.

4. N. Sokownin gave the results of his researches upon the "Innervation of the Urinary Bladder." His experiments were chiefly directed to the determination of the central nervous apparatus by which the bladder is excited to contract. He agreed with Afonaseff that the contractions of the bladder which occur when the pedunculi cerebri are irritated are due to the excitation of the vaso-motor system; and he found that, on applying a ligature to the aorta, he could exclude the influence of the irritation of the cerebral peduncles. He concludes that there is a motor centre for the bladder in the brain, the motor nerves descending in the spinal cord, emerging with the first, second, and third roots of the sacral nerves, and entering the hypogastric plexus. A portion also passes from the spinal cord in the first instance to the inferior mesenteric ganglion, and then to the hypogastric plexus. Reflex contractions of the bladder are induced (1) by excitation of the sensory nerves of the body generally (sciatic, crural, and splanchnic), with the exception of the pneumogastric; and (2) by the excitation of the proper sensory nerves of the bladder itself, which are partially contained in the sacral nerves and partly in connecting branches between the plexus hypogastricus and the inferior mesenteric plexus. The contractions called forth by the first-named nerves depend upon perception of pain, and do not occur if either the hemispheres are removed or the spinal cord is divided in the neck. The reflex actions which can be induced by irritation of the sensory sacral nerves of the bladder have as their centre some point in the vicinity of the fourth lumbar vertebra; whilst the reflex actions which are excited through the sensory sympathetic fibres have the inferior mesenteric ganglion as their centre.

5. A. Naumow and S. Beljaew give the details of their experiments on "The Effects of Respiration of Oxygen and Atmospheric Air on the Temperature of the Body." They showed that in man and dogs the temperature of the body during the respiration of oxygen varied in the same way, under similar conditions, as during respiration of air. The number of the cardiac beats did not appear to be influenced by the respiration of oxygen, but the rapidity of the current of blood in the carotid was augmented.

6. Professor F. Nawrocky, of Warsaw, made a communication upon "The Secretion of Saliva by Reflex Action." Two works have recently appeared (one by Owjannikow and Tschiriew, the other by

Grützner and Chlapowsky) which have been supposed to add a new fact to our knowledge of the mode in which the secretion of saliva can be reflectorally excited, namely by irritation of the sciatic, auricular and other nerves. Nawrocky, however, has been unable to corroborate these experiments, and attributes it rather to increased pressure of blood in the gland.

7. Dr. P. Spird, of Odessa, gave an account of his researches on "The Innervation of the Branchia in Frogs." This, together with 8, a paper by Professor J. Dogiel on "The Pharmacological Value of certain Uniatomic Alcohols," is too long, technical, and complicated for insertion here.

9. Professor N. Kowalewsky, of Kasan, communicated the results of his experiments on "The Physiological Action of Air entering the Blood-vessels," and showed that when a small quantity was injected into the centric end of the divided jugular vein, it caused diminution of the arterial pressure, with accelerated action of the heart, which again was followed by increased arterial pressure, and so on, in a series of waves of increased and diminished pressure (vagus stimulation), ending, ultimately, in a return to the ordinary condition. The injection of large quantities of air caused rapid reduction of the arterial pressure, apparently from increased obstacles to the passage of blood from the veins into the arteries, and death.

Other papers were by Dr. J. Nawalichin, of Kasan, on "Some Points in Relation to the Vaso-motor System," on "The Lymphatics of the Thyroid and Thymus Glands," and on "The Tension of the Brain and its Opposite Relations to the Circulation of the Blood;" by J. Schunkow, on "A Self-injecting Method of filling the Lymphatics of the Pericardium;" by Dr. J. Skworzow, on "The Histology of the Heart and its Investments;" by Drs. Arnstein and Gonjaew, on "The Nerves of the Intestinal Canal;" and lastly, Dr. P. Rudanowsky exhibited a large number of specimens of sections of the nervous system.

THE Congress for Anthropology and Prehistoric Archaeology will be held this year at Stockholm, in August. The International Congress of Orientalists will meet in London, in September.

THE American papers lament the rapid disappearance of the buffalo, which has been so unsparingly destroyed, not for its flesh, but merely for its skin, that it is now almost impossible to catch a glimpse of the animal east of the Rocky Mountains. This result is scarcely to be wondered at, if we are to believe the statement, made on the authority of an old hunter, that on the Rickaree river alone two thousand buffalo-hunters had been camped out together, and that it was not unusual for a skilful shot to bring down as many as two hundred animals in the course of a season. This wholesale butchery has had the natural result of lowering the price of the skins, which have lately only brought on an average one dollar, sixty, and forty cents respectively, for the hides of males, females and young animals.

DR. MOHNIKE, Inspector-General in the Medical Department of the German Imperial Service, has made some interesting observations in regard to the question, so often mooted by naturalists, whether crocodiles are voiceless. During a residence of many years in the Indian Archipelago, Dr. Mohnike had the opportunity of observing a large number of the ordinary local species of crocodile, specimens of which are frequently to be met with in estuaries and high up the rivers; and the result of his long and carefully-conducted observations of these animals is that, while the young possess an audible voice, which gives forth a bleating sound, the full-grown and old members of this Saurian family are completely voiceless. In this respect, therefore, his observations are perfectly in harmony with those of A. von Humboldt, who, in the first volume of his *Recueil d'Observations de Zoologie*, asserted

that, while the young of the alligator of tropical America could readily be excited by terror or surprise to utter piercing cries not unlike those of a cat, he and his companions, during their long sojourn on the banks of the Orinoco, had never heard a sound from any of the older animals, although they were almost every night in the immediate vicinity of numerous gigantic specimens of the family.

According to Dr. Mohnike, this voicelessness on the part of the adult crocodile is due to a special and gradual modification of the tongue and larynx, involving the chordae vocales, and dependent upon and coincident with definite periods of growth. In the young of this species the length of the head is more than twice as great as the breadth, while in the full-grown animal this proportion is very considerably diminished, at the same time that the lower jaw becomes more fixed and immovable, and the tongue more firmly connected with all the surrounding parts. It is to this gradual, but very decided, hardening and stiffening of all the ligaments of the larynx, as well as of all parts of the internal structure of the mouth, that Dr. Mohnike ascribes the loss of voice observable with advancing age in the crocodile; and accounts for the fact, which he had himself an opportunity of observing, that the older animals may be irritated and injured, and even tortured to death, without giving utterance to the faintest sound.

THE French Assembly have voted a pension of 12,000 francs to M. Pasteur for his eminent services to science, more particularly for his researches into the causes of the diseases of the vine and of silkworms. One half of the pension is to revert to Madame Pasteur after her husband's death.

THE Rev. Albert Löwy has been appointed Editor and Secretary to the Society of Hebrew Literature.

A *Magazin für jüdische Geschichte und Literatur* has been commenced at Berlin under the editorship of Dr. A. Berliner.

DR. KLEINERT, Professor of Theology in the University of Berlin, proposes the following solution of a problem which has puzzled many interpreters of the Old Testament, viz., why Eve should be said to have been formed from a rib. Referring to the passage in Professor Max Müller's *Lectures on the Science of Religion* where the Hebrew legend is compared with similar legends of other races, and traced back to the Semitic idiom, "Thou art bone of my bone," Professor Kleinert says: "Why it was a rib in particular from which Eve was believed to have been formed, must likewise be explained by the rheмато-mythological process. The primitive Semitic language possessed a word 'hav, rib. It is preserved in the Arabic dual form *al-havāni*, which can no more be referred to a triliteral root than *yadāni*, the two hands. The word was lost in Hebrew, but, before it was lost, the name of the mother of all living, 'Havvā, had been mixed up with 'hav, the old word for rib, so that nothing was more natural than that Eve should be said, not only to be 'bone of my bone,' but the very rib, or hav, of Adam. The later etymology of 'Havvā (Eve, from 'hayah, to live) is peculiar to Hebrew."

ALL students of popular poetry will be glad to learn that the second volume of the *Gwerzion Breiz-izel*, the *Chants Populaires de la Basse Bretagne*, by M. Luzel, has just been published. M. Luzel has received the acknowledgments of the highest authorities for the manner in which he has edited these songs. They are all collected from among the people, they are printed exactly as they are recited, nothing is altered, corrected, improved, or smoothed. M. Luzel stands between us and the Breton people, not like a landscape painter, who draws a picture that is to produce an artistic effect, but like a photographer, who gives us exactly what there is, without ever touching

the negatives which his camera has yielded him. M. Luzel frequently gives us the same song in different versions, but he does not mix them so as to form a more complete poem.

The poems published in the first and second volumes are of a narrative or epic character; they are called *gwerzion* by the people; the third and last volume will contain the *soniou*, the lyric poetry.

With one or two exceptions, the poems published by M. Luzel in the second volume are all *anecdota*, at least in that form in which he gives them. There are many more, he tells us, printed on fly-sheets, and sold by travelling singers at fairs ("aux pardons et aux foires"), which, if collected, would fill at least two volumes. But many of them are either modern, or, if ancient, have been modernised to suit the taste of the period.

As M. Luzel gives both the text and a literal translation of every song, his book will be of great interest to Celtic scholars, and we only hope that a wish expressed long ago by M. Renan—himself, we believe, of Breton origin—may soon be realised, that a chair of Celtic Philology be founded at the *Collège de France*.

ARRANGEMENTS have now been made by the English Dialect Society for the immediate commencement of the printing of a work upon English plant-names, by Messrs. Britten and Holland, to which attention was drawn in the Report of the Society for 1873. As the work is of considerable extent, being the result of many years' labour, it will be published in parts; the first part will probably contain the portion from A to D, and will be ready, if possible, by the end of the present year, so as to be included among the Society's publications for 1874. Any contributions to this work should be forwarded at once to Mr. James Britten, at the British Museum. It is intended to include all local plant-names, which are to be explained by help of the scientific names. Further information is supplied in the report alluded to above.

The society will also publish a volume of additions to Forby's well-known *East-Anglian Glossary*, chiefly by the late Rev. E. S. Taylor, and Mr. Bevan of Bury. It will be edited by Mr. Skeat, formerly curate of East Dereham, Norfolk.

At the last meeting of the Manchester Literary Club, an interesting paper was read by Mr. T. T. Wilkinson, F.R.A.S., on the "Dialect of East Lancashire." Valuable details were given of the peculiarities of that very composite dialect, and in conclusion Mr. Williamson pointed out that there are at least 121 dialectic words in Chaucer, and 91 in Spenser which are still in daily use in East Lancashire, although not one of them is to be found in any modern dictionary. Of these, Chaucer uses three words which may have been derived from the Keltic, forty-five Norse, eight Frisian, sixty Anglo-Saxon, and three Norman-French. Spenser has thirteen words that may have come from the Keltic, thirty-nine Norse, six Frisian, twenty-six Anglo-Saxon, and three from Norman-French. These two voluminous authors have only eighteen of the north-country dialectic words in common. Various speakers pointed out that the dialect of North and Mid Lancashire is distinct from that spoken in the South and South-east of the county, some holding that the Ribble is the line of demarcation, and some maintaining that the South Lancashire dialect begins only at Bolton. Mr. W. E. Axon made an important suggestion with regard to the *Gest Hystoriale of the Destruction of Troy*, recently published by the Early English Text Society. The editors attribute the poem to "Huchowne of the Awle Ryale," whom they identify with Sir Hugh of Eglinton, mentioned by Dunbar; but Mr. Axon argues that various circumstances go to prove that the author was a native of Lancashire.

MEETINGS OF THE WEEK.

ROYAL GEOGRAPHICAL SOCIETY.

At a crowded meeting of the above Society on Monday evening the 13th instant, Sir Bartle Frere, the President, announced that Colonel Grant, the Rev. Horace Waller, Mr. Hutchinson, and Mr. Webb—Livingstone's old friend—had been selected to receive the doctor's remains in London. Her Majesty's Government had come forward in a most willing spirit to undertake the charge of the funeral at the public cost. The 18th instant had been selected by Dean Stanley for the ceremony, and there would be made every effort to provide accommodation for members of the Royal Geographical Society, and for the public.

Mr. Clements Markham, C.B., then read a letter from Mr. Holmwood, of the British Consulate at Zanzibar, giving particulars elicited from Majwara, one of Livingstone's native attendants, respecting the doctor's last journey. The party left Uyan-yembe with Livingstone about the end of August 1872, and made for the south of Lake Tanganyika, crossing the Rungwa River, where they met with some boiling springs. They crossed the Chambezi about a week's journey from Lake Bemba, and recrossed it just before it entered the lake. After making a detour round Lake Bemba, they journeyed by canoes to an island in the lake, called Matipa. After having with difficulty secured more canoes, they crossed the lake diagonally, and arrived in a long valley where the rains had swollen every stream, and made progress a matter of extreme difficulty. Dr. Livingstone, who had been ailing since leaving Uyan-yembe, wished to cross the hills to Katanga, and thence return to Ujiji through Manyuena. But on approaching the northern part of Bisa, he had to take a sort of native palanquin. On arriving at Ilala, where the Sultan dwelt, they were not permitted to advance further, and they accordingly built a hut and fence for him at Kabende, where he finally breathed his last on the night of May 4, 1873.

Mr. Laing, who had brought the body from Zanzibar, said he had conversed with Jacob Wainwright, one of the boys sent by Mr. Stanley to meet Dr. Livingstone from the coast, and it was gratifying to find in what affection and esteem the doctor was held by all people on his journey. Wainwright furthermore spoke and wrote English very well, and had kept a diary since the doctor's death.

A paper was then read by Mr. Ashton W. Dilke on his recent journey across Turkistan by way of Kuldja and Tashkend. In the course of his travels, Mr. Dilke could not help observing that Russian goods were universally preferred to English, inasmuch as they are better suited to the requirements of the people. While at Kuldja, he ascertained that gold and silver were plentiful in the neighbouring mountains, and that coal was so cheap as to fetch only three halfpence a hundred-weight. The region eastward was a complete desert, but the valley of the Ili was, on the contrary, fertile. Lake Balkash, into which the river Ili flows, is of considerable extent, averaging about three hundred miles long and fifty miles broad, while the mountains on the northern side attain the height of 12,000 feet. At one time a good road existed towards Peking, but it had fallen somewhat into disrepair. Lake Issykul to the south appears to be of recent origin. One hundred and fifty years ago it was apparently not known, and there are proofs of villages having existed on its site, the ruins of the buildings being visible at the bottom. In conclusion, Mr. Dilke gave a graphic description of that fanatical race, the Tungans, who have for several years formed the nucleus of the Mohammedan rebellion against China.

LINNEAN (Thursday, April 16).

"CONTRIBUTIONS to the Botany of the Challenger Expedition," by H. N. Moseley, M.A. No. III.—X. Notes on Fresh-water Algae in the boiling springs

at Furnas, St. Michael's, Azores, and their neighbourhood. In the Valley of Furnas there are two distinct sets of hot springs: at the village itself, and at a distance of two or three miles on the shore of the lake. In the principal spring of the latter set ebullition is continually going on, and no algae were found in it. At a short distance is another sulphurous spring, very hot but not boiling; this is covered to the depth of about an inch with a shining substance, composed entirely of Oscillatoriae, mixed with a Chroococcus and a few skeletons of Diatomaceae. Close by the sulphurous springs are shallow pools of hot water, edged round with a Chroococcus. In the other set is one boiling spring. Immediately below it is a swamp of hot mud, also full of Chroococcus, mixed with Oscillatoriae. The alga found in greatest abundance closely resembles that described by Rabenhorst as growing in warm springs in Europe. In a warm stream of about 95°F. was found a Conferva growing amongst the fibres of a moss. The neighbouring lake, in which are several patches where sulphurous gas is discharged, is rich in algae, chiefly Nostoc, Oscillatoria, Hydrodictyon, &c.

Appended to the report were some notes by Professor Dyer, stating that the algae sent home by Mr. Moseley had been submitted to Mr. Archer and the Rev. E. O'Meara. Mr. Archer states that the algae are all well-known and common species, several of them British, including Spirogyra, Mesocarpus, Bulbochaete, Oedogonium, Pediatrum, Botryococcus, &c. Mr. O'Meara reports that the Diatoms are also those of most frequent occurrence in fresh-water, and appear to be in no way affected by the high temperature.

ROYAL INSTITUTION (Friday, April 17).

"On the Composition of Colours by Polarised Light." By William Spottiswoode, F.R.S., LL.D., &c.

It is well known that the colours produced by crystal plates in polarised light are due to the suppression of one or more of the components of white light. If the resulting colours be examined by the spectroscope, their spectra will show one or more dark bands in the portions suppressed. This fact, with some of its consequences, was the subject of an investigation many years ago by MM. Foucault and Fizeau; and their experiments received some further development at the hands of Mr. Spottiswoode last year.

Starting from this principle and using a quartz plate, cut perpendicularly to the axis, and a double image prism as analyser, the lecturer showed that the spectrum of each of the two complementary images contained a dark band; and that if either band were shifted, the other followed at a certain interval. In this way the positions of the bands, so far as they admit of definition, indicate the positions of complementary colours.

It was then shown that, by using a second double-image prism, the intensity of light in either pair of the four images so produced might be reduced at pleasure; and by this means it was proved, in accordance with Helmholtz' experiments, that the low-tint colours, e.g., russet, brown, olive green, and peacock blue, are simply the result of low illumination.

By the use of a second quartz plate, four images of different tints were formed; the nature of the tints produced by the overlapping of the images was explained; and it was shown that where three of the images overlapped, the resulting tint must correspond to the tint suppressed in the fourth image.

Lastly, by the use of a third quartz plate and double-image prism, it was shown that the eight images so formed might be grouped in pairs such that the tint remaining in one of each pair would correspond to the tint of the parts suppressed in the other.

The lecturer explained that in its present rough-hewn state (as he described it), the method gave

only approximations to the results obtained by the methods of Helmholtz, Clerk Maxwell, and Lord Rayleigh; but he suggested that it was probably capable of further refinement.

NUMISMATIC SOCIETY (Thursday, April 16).

THE meeting was entirely occupied with two papers of biographical interest. The first, by Mr. Henfrev, brought forward a number of interesting particulars concerning T. Simon, the celebrated medallist of Guernsey. The second paper, being a continuation of the "Annals of the Scottish Coinage," by Mr. Cochran Patrick, owed its chief interest to the famous engraver Nicholas Briot, whose relations with the Scottish Mint were very clearly set forth in the paper.

SOCIETY OF ANTIQUARIES (April 16).

MR. RALSTON communicated to the Society the programme of an archaeological meeting which is to be held at Kiev, on the 14th of next August, to last about three weeks. The programme contains a list of questions for discussion on Primaeval Antiquities, the Historical Geography and Ethnography of Russia, Arts and Sciences, Manners and Customs, the History of the Church, Russian and Slavonic Literature, and Byzantine and Oriental Antiquities. An exhibition of Slavonic antiquities will be held, and the tumuli near Kiev will be excavated in order to discover to what race and age they are to be ascribed. Excursions will also be organised to places of interest in the neighbourhood. The Rev. S. S. Fowler read an account of the archaeological proceedings at Durham during the past year, and of the restoration of the Cathedral and the Church of Monk Wearmouth, which was built by Benedict Biscop in the seventh century. The church of St. Giles' was saved from destruction by the timely remonstrance of the Durham Archaeological Society. Mr. Fowler exhibited several objects of great interest from Durham, which will be enumerated in our next number.

FINE ART.

Richard Wagner and the Music of the Future. History and Aesthetics. By Franz Hüffer. (London: Chapman & Hall.)

THE name of Dr. Hüffer will be no unfamiliar one to the readers of the ACADEMY; nor, it may be presumed, will it be needful to do more than remind them that he is one of the most enthusiastic and ardent of the partisans of the new school of music, to which so many, especially in Germany, have given in their adherence. He is, moreover, not a mere talker, but a man who can give an intelligent reason for his musical faith, and whose opinions, therefore, deserve respect even from those who may not be able unreservedly to accept his conclusions. On these grounds the present work claims the attention of all who take an interest in the artistic questions of the day.

On taking up the book, the first thing which arrests the reader's attention is the emblematical design on the cover—a large tree, above which is inscribed the name of Wagner, while in the various branches are found the names of Franz, Schumann, Liszt, and Schubert—the last-named being the lowest. Whether this order is intentional or not, we cannot say; but if the conclusion is to be drawn that Schubert (whom Liszt himself calls "the most poetic of musicians") is to be ranked below Franz or Liszt, to say nothing of Schumann and Wagner, we em-

phatically protest against the arrangement. Possibly, however, the inference may be strained, and the position merely accidental. In any case, that Wagner is to be placed "at the top of the tree," it is the aim of a large portion of Dr. Hüffer's book to prove.

A great part of the substance of the present work appeared originally in the *Fortnightly Review*; a smaller portion (chiefly letters by Schumann) in the columns of the ACADEMY. The author has, however, remodelled the whole; and in his preface he explains the aim he proposes to himself. He commences with the assertion, from which few will differ, that the Ninth Symphony of Beethoven marks a new phase in the history of musical art. He speaks of the first three movements of that work as "the triumph of absolute music"—a somewhat vague term, by the way, which leaves one a little at a loss as to the author's precise meaning. What is "absolute" music? Is it music without words? or is it the opposite of "programme" music? Dr. Hüffer proceeds to say—

"But in this very splendour of artistic perfection, we indistinctly, but no less certainly, feel the want of something that remains unexpressed; and by acknowledging this want, as founded in the nature of music itself, and introducing into the last movement of his D minor symphony the human word, as a firm basis for his lofty aspirations, Beethoven has at the same time ushered in a new period of his art. To define the aesthetical foundation of this new idea in music, and at the same time follow the course of its growth, will be my chief task in the following pages."

These words give us clearly and succinctly the leading idea underlying the whole of the "Music of the Future," which might be defined as "music upon a poetic basis." This basis may be either dramatic or lyrical; and the present work deals with both forms. Dr. Hüffer treats of Wagner as representing the dramatic, and Schubert, Schumann, Franz and Liszt, as illustrating the various shades of the lyrical phase of modern music.

Here, before proceeding further, we must pause for a minute to remark that, if Dr. Hüffer means precisely what he says in the above quotation, the very large majority of musicians will join issue with him at once. Is there an incompleteness, a "want of something that remains unexpressed" in the first three movements of the D minor symphony? We venture to doubt it altogether, and do not think that one in a thousand of the musicians who have heard this work has ever felt such incompleteness. But, further, if Beethoven acknowledged this want as founded in the nature of music itself, and therefore introduced into the finale the human word, how is it that in the last quartets, which were all written subsequently to the symphony, and which rank among their author's finest and most carefully considered works, not a trace of the human voice is to be met with? Was Beethoven content to leave them incomplete? Assuredly not; for it is known that he lavished the most minute care upon their details. Had he felt that instrumental music alone was inadequate for the full expression of his ideas, why should he not in these works have repeated the experiment so suc-

cessfully tried in the symphony? The theory appears untenable; is not, we believe, Wagner's own; and has, moreover, little to do with his proposed reforms—which relate, not to music in general, but merely to its connexion with other arts in the drama.

By far the largest share of attention is given to Richard Wagner—more than a third of the entire volume being devoted to an exposition of his theories, and an account of his works. This subject has been so recently touched on in these columns (see ACADEMY for Feb. 14), that it is needless to repeat at length what was said on that occasion. There are, however, some points which are brought more prominently forward here than in Mr. Dannreuther's pamphlet, on which it is worth while to dwell for a few moments. Dr. Hüffer points out that Wagner largely adopted Schopenhauer's philosophical views; and to render the theories of the former intelligible, an account of the conclusions arrived at by the latter as stated in *Die Welt als Wille und Vorstellung* is given to us. Schopenhauer maintains that the whole external world exists only in so far as it has the "will to live," and that music, unlike other arts, is not a reproduction more or less perfect of external phenomena, but "as immediate and direct an objectivication, or copy of the will of the world, as the world itself is, as the ideas are of which the universe of things is the phenomenon. Music is not the copy of the ideas, like other arts, but a representation of the cosmical will co-ordinate with the ideas themselves" (page 10). The last part of this sentence seems in the translation somewhat obscure; Schopenhauer's own words are "sondern Abbild des Willens selbst, dessen Objectivität auch die Ideen sind"—a representation of the will itself, of which the ideas are also the objectivity. He goes on to say that hence the effect of music is more powerful than that of the other arts, because these latter speak only of shadows, but music of realities.

The general outline given by Dr. Hüffer of Wagner's theories is both complete and clear; he seems, however, to carry them even further than is done by Wagner himself, when, on page 18, he insists on the "mutual compromise" of music and poetry, and applies it to music in general. Unless we are greatly mistaken, Wagner himself only applies it to dramatic music; and it has not yet been definitely settled how far even with this restriction the proposed compromise will succeed. The intended performances at Bayreuth next year will no doubt afford material assistance in coming to a conclusion.

For a similar reason, because it begs the question, and assumes the very point under discussion—the relative positions of music and drama—we should hesitate to agree unreservedly with our author's strictures on Mozart's *Figaro* (pages 25, 26). Granted the justness of Wagner's views, Dr. Hüffer is undoubtedly right; but until they have been proved by the test of actual performance to be correct, it seems scarcely fair to adduce in their favour the weakness (which, moreover, would be by no means universally admitted) of works constructed on an altogether different system.

It must not be supposed, from what has been said, that it is the intention of this article in any way to condemn, or even to disparage, the present work. On the contrary, there is very much in it with which we most cordially agree, and which we heartily recommend; but for this very reason it is the more needful to point out matters which appear to be at least open to question.

The biographical sketch of Wagner, the notices of his writings, and the account of the innovations he has introduced into the drama, will be read with much interest. Toward the close of this portion of his book Dr. Hüffer discusses an article which appeared some time since in the columns of the *Daily News*, and which, to quote his own words (p. 104), "exhibited all the literary skill, but (if I may judge in my own case), not quite the more than common musical appreciation by which that journal is so favourably distinguished." All readers of the *Daily News* will readily endorse Dr. Hüffer's opinion of its musical critic; and it is only fair to that gentleman to say that we happen to know that the article referred to was not only not written by him, but that he was not even consulted with reference to it—to say the least, a somewhat unusual method of procedure.

In the reply which Dr. Hüffer addressed to the editor of the *Daily News*, and which is reprinted *in extenso* in the present work (pp. 105, 106), he again explains his theory, already adverted to, of a "poetical basis" for music. He says:—

"It was Beethoven who first distinctly felt, and Wagner who first expressed in words, the necessity of a previous 'poetical' impulse to which the forms of music proper would have to yield. The unimpaired vitality of pure instrumental music on these grounds is of course obvious, it being altogether a secondary consideration whether the 'poetical basis' be expressed in words or not."

We have already attempted to point out what we think to be the fallacy of the above extract, so far as regards Beethoven; and with respect to Wagner, he himself, if we understand him aright, does not apply his principles to abstract instrumental music at all. But, to test the matter practically, is there in point of fact any "poetical basis" to be found in the leading instrumental works of the modern German school, with the exception, of course, of such pieces of "programme music" as Liszt's *Symphonische Dichtungen*? Where is it in Brahms's Serenades or Quartetts, or in the very large majority of the important orchestral and chamber works which the industry and talent of musicians abroad are continually bringing forth? It seems a mistake to endeavour to apply to music in general a theory intended simply to apply to one particular branch—the musical drama.

In Dr. Hüffer's remarks on, and explanations of, the alleged absence of melody in Wagner's music, we cordially agree. What he says on this point deserves quotation:—

"The causes of this extraordinary want of perception seem to lie chiefly in two important features of Wagner's art, not to mention the intentional ill-will of party-prejudiced hearers, which explains, of course, everything. One of these causes is, strange to say, the continuous

flow of melodious beauty which characterises our master's creations, and which makes it much more difficult to single out a particular motive (*sic*) in his works, than, for instance, in the Italian opera, where a snatch of fine *cantilena* appears like an oasis in the desert of *recitativo secco*. Moreover, in Wagner, melody and harmony are so closely connected with the dramatic action, that their separate existence becomes imperceptibly mixed up with the general harmony of the work of art as a whole.

"The second cause referred to is the increased importance of Wagner's orchestra, into which a great part of the melodious flow is transferred, so as to give the voice more liberty in rendering the accents of genuine passion. It was only natural that both the bravura singer and his faithful adherents should retaliate for this breach of privilege, by not acknowledging, or, maybe, actually not perceiving, the existence of instrumental melody."

The last section of the portion of this book which is devoted to Wagner contains a very interesting and detailed account of *Lohengrin*, selected, as our author says,

"as showing most of the important new features of Wagner's art, yet without some of the more striking anomalies of his latest productions, the beauty and necessity of which can be tested only by the immediate impression of a performance on the stage."

The second part of the present work treats of Franz Schubert, whose name it is certainly no small surprise to find in connexion with "Music of the Future." Dr. Hüffer claims him as an adherent by reason of his setting of some of Heine's songs, of which he says:—

"It was under the influence of Heine's condensed lyrical pathos that Schubert abandoned the principle of absolute melodiousness, in which he had earned his greenest laurels, and to which he was led by the bias of his peculiar gift more than any other master since Mozart. The victory of poetical over absolute music—of the 'future' over the 'past'—was gained once more."

To this it may be answered, first, that Dr. Hüffer, who states that Schubert became acquainted with Heine's songs not long before his death, is on this point at variance with the composer's biographer, Kreissle von Hellborn, who says (English edition, vol. ii. p. 135) that they were written some years previously, and "have been wrongly catalogued by publishers as part of the collection which originally appeared under the title of *Schwanengesang*;" secondly, that out of the six songs by Heine which he set to music, two at least, "Das Fischermädchen" and "Am Meere," are as full of "absolute" melody, which would charm quite independently of the words, as anything he ever wrote; and thirdly, that in by far the larger part of the songs produced in the later period of his career (see Catalogue in Kreissle's Life), not the slightest trace of this "victory of poetical over absolute music" is to be found.

In introducing this, the lyrical portion of his subject, our author has given a very interesting dissertation on the history and characteristics of the "Volkslied." Into this, however, space forbids our entering here. The biographical sketch of Schubert contains all the important features of his life, and is far more readable than the large work of Kreissle von Hellborn, already referred to, which contains an amount of "padding" so great as to render it one of the most tedious specimens of book-making to be met with.

For the article on Robert Schumann, which follows, we have nothing but praise. The founder of the "romantic" school, as he is sometimes, and not unjustly, called, may fairly be considered as one of the pioneers of the "Music of the Future;" and Dr. Hüffer is undoubtedly right in attributing the wonderful effect produced by his best songs to the intimate union which exists between the poetry and the music. On this point he writes (pp. 229, sqq.)—

"The high position which Schumann takes among the masters of German song has been sufficiently defined by his being called the musical exponent of Heine. It seems, indeed, not unlikely that the verdict of an impartial posterity will base his chief claims to immortality on such works as the settings of 'Ich grolle nicht' and the whole 'Dichterliebe' series, not to speak of innumerable other 'Lieder,' small in form, but disclosing the infinite perspective of lyrical pathos, and unsurpassable in the congenial rendering of the poet's sentiments. . . . He stood in the midst of the literary movement of his time, and was prepared both by his genius and education to recast the newly-acquired treasures of poetry in the mould of his own art. The progress, therefore, marked by his songs was achieved by poetical rather than by musical means, another proof of the organic and indivisible connexion of the two sister arts."

Though perhaps less immediately bearing upon the subject, the important influence of the *Neue Zeitschrift für Musik* (of which Schumann was the founder) is also rightly insisted upon by Dr. Hüffer as "counteracting the antiquated prejudices of Philistinism." The whole of this, the third section of the book, is most excellent, and well deserving the careful attention of musicians.

The concluding portion of the present work is headed by the names of Robert Franz and Franz Liszt. The former, a most voluminous song-writer, bears some affinity of style to Schumann; with respect to Liszt, we will let Dr. Hüffer speak for himself:—

"In Robert Franz we observed, combined with the desire of a poetically free expression, a strong reverential feeling for the 'abstract sacredness of the musical form,' as shown in the strophic treatment of his songs. Liszt, on the contrary, has entirely freed himself from this awe; he is a poet, and nothing but a poet. His music, heard without the interpretation of the words, would in most cases seem an incoherent sequence of beautiful melodious snatches, interrupted by declamatory passages, and only connected by an indefinable continuance of sentiment which occasionally takes the form of what I have on a former occasion described as the 'leading motive.' The laws of tonality are continually violated by the abrupt introduction of the most divergent keys, and occasionally the metrical structure of the poem itself is obscured by the composer's dramatic vivacity. Here we have reached at last the consistent carrying out of the poetic principle in lyrical music to its final consequences."

The essential difference between Franz and Liszt as composers is clearly brought out by a description of their different settings of the same poem, "Im Rhein," by Heine. While Franz endeavours to express the general frame of mind ("Stimmung," as the Germans call it) suggested by the verses, Liszt gives what may be called a pictorial reproduction of every separate line. We do not know either of the songs; but, judging from Dr. Hüffer's description, think we should prefer the former.

Two appendices are given at the end of

the volume. The first contains an account of the laying the foundation-stone of the Bayreuth Theatre in May, 1872; and the second gives a collection of letters addressed by Schumann to Herr Anton Zuccalmaglio, one of the contributors to the *Neue Zeitschrift für Musik*, which have already appeared in these columns. On these, therefore, it is needless to dwell now.

A word must be said in conclusion as to the style and composition of this work. Dr. Hüffer possesses very considerable command over our language; but it is much to be regretted that he did not submit his manuscript to the revision of a competent "native," as his English is frequently clumsy, and occasionally even ludicrous. Many examples might be given; but a few will be sufficient to justify this statement. In his preface, Dr. Hüffer talks of "fix its nondescript airiness into a local habitation and a name." Again, we find such unidiomatic expressions as "the whole weight of the musical energy is placed into the dialogue" (p. 76), "showing an immense progress upon it" (p. 114), "an almost eccentric aversion against" (p. 195), and such a fearfully and wonderfully-made sentence as the following (p. 264): "Wherever he does imitate unconsciously (as his situation of a beginner, with the admired examples of great masters before him, made it almost impossible to avoid)." As an example of ludicrous misuse of a word may be quoted a sentence (p. 257) where the author speaks of "the much greater velocity of the instruments"—meaning power of rapid execution. One more quotation only shall be given, in which the height of the unintentionally comic is undoubtedly reached. Speaking of Schubert's father, Dr. Hüffer says (p. 126), "his two matrimonial engagements were blessed with that fertility of propagation which seems to be the enviable lot of this in many respects peculiarly favoured class." It is to be hoped, for the credit both of Mr. and Mrs. Schubert, that the above statement is not literally correct!

Of course, the artistic merit of the book is not diminished by such flaws as these, but its literary value is undoubtedly lessened; and if (as is not unlikely) the work should reach a second edition, we hope Dr. Hüffer will have the whole text submitted to a careful revision.

We take leave of *The Music of the Future* with the feeling that though it contains several things with which we have been conscientiously compelled to differ, it is nevertheless a valuable addition to our musical literature, the result of much careful thought, and a work for which the author deserves the sincere thanks of musicians, whether professional or amateur.

Ebenezer Prout.

WILHELM VON KAULBACH.

WILHELM VON KAULBACH died on April 7, of cholera, at Munich, in the sixty-ninth year of his age. He was the last of a race of painters of which Germany may be proud; the last of a school which has ceased to be admired by the realistic Germans of the present day. In the vast and important series of monumental compositions which he produced in Munich and Berlin, we find an art consummate in its way—an art which can be compared with nothing that has been created in any modern school in any other European country.

On the one hand, studied composition on grand but constantly recurring lines, form cast in a mould ideal indeed and often grandly powerful, but seldom winning in its attraction; light, shade, and colour toned down to a neutral tinge; nature generalised or merely symbolised in every detail not architectural; on the other hand, rich veins of frolicsome and kindly humour in single episodes—as in the frieze of the Berlin Museum hall, the illustrations to *Reinecke Fuchs*, or the series of Goethe's female characters; bursts of realistic passion and force in compositions far too sensual for any but prurient tastes, and in the latter days a withering power of cutting and lashing the religious foibles of a now prominent class.

Kaulbach was born in 1805, at Arolsen, in the duchy of Waldeck, and bred in the workshop of his father, a goldsmith and watchmaker in a small way. Hermann Becker, a well-known critic, who knew Kaulbach well, and shows a thorough acquaintance with the various periods of his career, tells of the struggles of the family, and how it went ill with old Kaulbach at Arolsen, Iserlohn, and Mühlheim an der Ruhr, where he successively resided. He describes how Rauch, the sculptor, himself a native of Arolsen, advised young Kaulbach as to the choice of his profession; how Kaulbach learnt the first elements in 1822 in the Düsseldorf Academy, over which Cornelius presided. In the rooms of that Academy a cartoon is still preserved which hardly gives a clue to the versatile character of the young artist who drew it. In 1826 (the dates are Hermann Becker's), Kaulbach followed Cornelius to Munich, and was there launched in the career in which he became so celebrated. His earliest frescos are in the arcades of the Hofgarten; he then painted *Apollo with the Muses* in the Odeon, scenes from the myth of Amor and Psyche in the palace of Prince Max, and other monumental pieces of equal compass. The quaint but disagreeable *Madhouse* which is so well known by prints, he executed about 1830. *The Battle of the Huns*, completed in 1837, was followed in 1846, after a stay in Italy, by *The Destruction of Jerusalem*, both pieces being subsequently repeated in the hall of the Berlin Museum. In the *Reinecke Fuchs* illustrations, and the frescos on the outside of the Munich Pinakothek, of which the bleached remains alone survive, we have contemporary labours of very unequal merit, the first being as clever in their way as the others are feeble and poor. They are but slightly older in date than the frescos in the Berlin Museum, the execution of which was in a great measure entrusted to pupils. In 1849 Kaulbach succeeded Cornelius as director of the Bavarian Academy of Art. Ten years later he finished one of his most famous pictures, the *Battle of Salamis*, in the Maximilianum at Munich. The *gracille* cartoon (in oil) of Peter Arbues is one of his latest and most characteristic works. Kaulbach was in the habit of retiring in spring and summer to a villa in the North Italian lake country. He suffered much from lameness, and it was whilst confined to bed on account of this ailment that he fell a victim to the cholera.

J. A. CROWE.

THE PICTURES OF CHARLES I.

Since my communication on this subject, which appeared in the ACADEMY of March 7, I have seen at the British Museum a diminutive manuscript volume, marked "Egerton MS. 1636," from which a variety of further information regarding the fate of the King's picture gallery may be gathered. This manuscript is the note-book of an art connoisseur of the Commonwealth period. The latter part of it is thus prefixed: "Some observations I made of certain old paintings I have seen in London since my return from Italy." Passing by the notices of certain private collections, we read:—

Of the King's at one Harrison's ye King's embroyderer neare ye Thames at a wharfe neare Som'set House. 30 Dec. 1652.

Titian. A Bishop, a Madonna and babe, half figures, &c. 40l.
St. Jerome whole body sitting in a cave leaning on a rock, a lion by him, & it bound about with cords, & almost naked. Some say by M. Angelo: 'Tis upon board. I believe it be ye Giulio Romano. 200l.
4 large pieces at length done by Vandyke after old pictures of King James—Qu. An., Prince Henry & ye Qu. of Bohemia, all in gult frames. 30l. a piece.
A Venus at length naked & Cupid, by Bronzino, written upon it. 40l.

In St Peter Richard's howse of web Mr. Grynder the upholster at the Lyon in the Poltry has the keeping

Julio Romano { 11 Cesars on horseback in long pieces of deale boards, one piece each

A Madonna praying to ye babe
2 tall figures standing by & 2 behind.
The Id. Savill (?) has offered & bought it for 250l. but bec. 'tis of board & so large cannot carry it away. Lord Pemb. offered the King 1,000l. for it.

Corregio. A Sta Magdalena 3 spans long almost 2 broad upon a thick board, they hold it at 80l. but they take 40l. 35l. has been offered.

In Austen Fryars at Decretts house 3 Rooms full of the King's Pictures.

2 large quadro's for colourd a Secco by Corregio about 3 foot & a qr. One Markas being fleasd & one offers snakes towards him, a boy below smyling. The other of Pallas & others—both prized at 1,000l. a piece. The King's head in white marble done by Bernino at Rome—priz'd at 400l.

All the King's children done together by Vandyke—priz'd at 80l.

Among the State Papers of the year of the Restoration is a letter from Fras. Trion, merchant, to the King, to the effect that on May 17, 1653, he bought a picture of the late King's five children, by Sir Ant. Vandyck, and preserved it, hoping to live to present it to his Majesty.

The Spanish Ambassador hath bought that were the Kings—A Cardinal sitting & 2 old men behind him all on boards of Sallow (?) very broad & thick, by Tintoret. 800l. he gave for it.

The State gave him the 11 Cesars of Titian &c. These cost the King 100l. a piece, for which he was offered 12 thousand pounds.

He has the famous Venus of Titian for which the King was offered 2,500l. 'tis copied by Walker. &c., &c., &c.

The Walker mentioned here is no doubt one Robert Walker, who flourished in the time of the civil wars, and so greatly improved himself by studying the works of Vandyck, as to become a popular painter of portraits. He was a great favourite with the parliamentary chiefs; Cromwell himself sat to him at least for four different portraits. One of these represented the Protector with a gold chain about his neck, to which were appended a gold medal, the arms of Sweden, and a pearl, sent to him by the Queen Christina; this picture was found at an inn in Cambridgeshire, and came afterwards into the possession of Lord Montford. A second portrait is said to be at Oashiobury, in Hertfordshire. The third of these has also a little history attached to it. The agent of the Duke of Tuscany having received orders from his master to procure a portrait of Cromwell, met with one in the hands of a lady, who refused to part with it under five hundred pounds. The sum was paid, and the piece sent to Florence, where it remains. Walker's own portrait, by himself, is in the Ashmolean Gallery at Oxford. He died at Arundel House, in the Strand, about 1660.

In this little manuscript, too, are a few notes about Vandyck, which seem worth printing. These are:

In the year 1651 or 1652 the things of Vandyke were bought up by the Flemings, at any rate (those) wch were the Kings. He married ye Id. Ruthens daughter and by her had a daughter about a year afore he dyed.

His widow was courted by divers of quality. At last she married one Price of Wales whose father expected much money to pay debts, saying that pictures would pay no debts.

40l. he had for a half figure; 60l. for a whole body. He was of Antwerp and scholar to Rubens, he had tin in Italy, and after he marryed he went into France and there his pictures were not esteem'd, and so he returned to Engl. King Charles gave him that howse in Bl. Fryars.

In March, 1662, "Justina Vandyke, alias Stepney, only daughter of the late Sir Ant. Vandyke," petitioned Charles II. for the place of dresser to the Queen, or some order for her livelihood, satisfaction having been already promised her for 1,500l., due to her father by the late King. She alleged that she had received little of her father's estate, it having been embezzled in the late times. A pension of 200l. a year was at once

granted to her; but the payment of it, like that of every other official allowance or salary at that period, soon fell into arrear; and in 1664 Justina prayed for the continuance of her pension, stopped a year ago, or some other relief, as she had nothing else to subsist upon. George Stepney, the poet and well-known representative of William III. and Anne at various foreign courts, it is interesting to bear in mind, was this lady's grandson.

When the estates, &c., of Thomas, Earl of Arundel and Surrey, were valued in order to determine the amount of his fine as a "delinquent" against the parliament, a deduction was made, amongst others, for a debt of 140*l.* due to "Sir Anthony Vandyke, his executor."

As an opportunity may not occur again of directing attention to this little contribution to the history of Art, I append here, for the information of those curious in the matter, a few of the most noteworthy headings to the lists of the different picture collections visited by the writer:—

Pictures in the closet of the Lady Anne Mary Howard, now in Arundel House, 1653.

Mr. [Francis] Cleyne near Covent Garden Church.

The collection of the Earle of Northumberland in Suffolk House, 27 Dec. 1652.

Geldrop painter of Antwerp at his house in Archer Street, 4 June 1653.

[Francis] Barlow, living near the Drum in Drury Lane.

Mr. Bayleys.

The list at "Mr. Bayleys" includes the picture by Correggio of *Mercury Teaching Cupid to Read*, now in the National Gallery, and states the price demanded at 650*l.* :—

A Dutchman that sells Cabinets in Clare Street.

In the Duke's Place by Algate.

Mr. Boardman, by Greys Inn Gate.

One Mallory a captain of the city, and a doughty painter, by the Stocks, who hangs out things on the church wall.

The Earle of Pembroke's Collections of Paintings at Durham House.

J. J. CARTWRIGHT.

ART SALES.

MESSRS. CHRISTIE re-opened their rooms after Easter with the sale of the decorative objects from the palaces of the Duke of Salamanca at Madrid and Vista Alegre, which so wonderfully escaped destruction in the fire at the Pantechnicon. The exhibition of pieces of tapestry is of the greatest interest, probably the most extensive that has been seen in London, covering every wall of Christie's rooms. They are of various styles and fabrication, the produce of Flanders, France, and Spain. The old Spanish works of the sixteenth and seventeenth centuries were probably made by Flemish workmen in Spanish looms. They represent incidents in Spanish history, with half-length figures in the angles, and borders composed of flowers, gold and silver threads being mixed with the silk and wool—a style introduced in the sixteenth century. The metal is now blackened by age, and the lights replaced by shadow. A fine series is worked entirely in silk, the work of the frame being combined with that of the needle, in the style called "an passé." The subjects of these gorgeous silk tapestries are mythological divinities drawn in their chariots: Venus by doves, Saturn by eagles, Apollo by horses, &c. Africa, in a symbolic piece, is drawn by lions; the borders consisting of wreaths of flowers. The most exquisite piece of needlework is a small panel, subject, "The Assumption of the Virgin," elaborately embroidered with fruit and flower border. The Gobelin tapestries, subjects taken from the history of Jason and Medea, are similar to those in the great drawing-room at Windsor Castle. There is also a fine collection of Limoges enamels by the first masters, many signed and dated. An oval dish, "The Judgment of Paris," by Pierre Raymond; others by Courtois, Laudin, Pénicaut, and others. The collection of Abruzzi ware is also very extensive, and there is some very fine oriental porcelain of unusual size and fine quality. There are also large busts of Alcara ware, and statuettes of Buen Retiro; carvings in rock crystal and ivory. The decorative furniture consists of large cabinets, richly sculptured,

ornamental clocks, and a variety of artistic treasures, which well deserve the fullest consideration.

PARTICULAR interest will be evinced in a sale to take place on Friday next, April 24, when Messrs. Christie and Manson will dispose by auction of that portion of the exceedingly well-known and varied collection of Mr. John Heugh which has been until now in the country-house which he intends vacating. What is called the Holmewood collection consists entirely of English water-colours and of modern pictures in oil, nor is there any considerable phase of recent English art which is not represented here. The works of the earliest masters of English water-colours which a fashion which may be but the fashion of a moment causes to be sought for, are not to be found in this collection, but the greater masters of the middle period are richly represented, since there are more than twenty Turners, several works of De Wint, several of David Cox, and several of Copley Fielding's. From the Gillott collection there is a great picture, *The Chess Players*, by William Muller. The Turner pictures in oil number three, and among them are the *Dunstanborough Abbey* and the *Mill and Lock* (subjects known to all who know the prints of *Liber Studiorum*). These two were seen at Burlington House a year or two ago. To instance some examples of totally different schools, we may say that there is an "Annunciation" by Dante Gabriel Rossetti, and that there are two famous Delaroches from the Demidoff collection; and that the Norwich school of landscape, which flourished, as the reader knows, in the earlier years of this century, is represented by several pictures by "Old Crome," and one of the best of Cotman's.

NOTES AND NEWS.

THERE is now at the Burlington Fine Arts Club an important series of portraits by Mr. Watts, R.A.

THE two Sèvres vases which fetched at Christie's the fabulous sum of 6,500 guineas, cost their former possessor 300*l.* But Lord Dudley had a formidable competitor in an agent from Paris of Baron Rothschild, and "when Greek meets Greek," &c.

A TIME-HONOURED proverb has been falsified in the life of Thorwaldsen. That sculptor was the greatest of heroes in the eyes of Wilckens, his *valet-de-chambre*, and the old man, who now takes care of the Thorwaldsen Museum, has just published a little volume of reminiscences of his dead master. The book consists of fragmentary anecdotes, not very important in themselves, but, on the whole, adding something of distinctness to our conception of Thorwaldsen.

MR. JOHN W. WILSON, who has been exhibiting his splendid collection for the benefit of the poor of Brussels, and who is known by other acts of generosity, has just been named Chevalier of the Légion d'Honneur.

IN obedience to the wishes of the German Prince Imperial, Professor Ernst Curtius has gone to Athens to seek from the Greek Government permission to make a scientific and systematic survey of the district of Olympia, in order to prepare for the explorations which he is to conduct in concert with Professor Adler.

DR. SCHLIEGMANN writes from Athens, April 5: "In order not to lose my precious time, I have now made an agreement with the Greek Government to make excavations in the Acropolis of Mykene, where I shall commence operations this week, and where I am hopeful to bring to light, in less than a month, among many interesting objects, hundreds of tangible proofs that Here βωωνίς was originally 'a cow-headed monster.'"

M. LOUIS-AUGUSTE LAPITO, French landscape painter, died on the 7th instant at the age of sixty-five. He was a pupil of Watelet and Heim, and enjoyed a considerable reputation during the later

years of the Restoration and the reign of Louis Philippe. His water-colours also are highly esteemed. Specimens of his works are to be found at St. Cloud and Fontainebleau, and in other French collections, and also in the Royal Gallery at the Hague and the Musée Léopold at Antwerp.

THE Marquis d'Azeglio, in a letter dated 30th of March, addressed to the Municipality of Turin, makes the generous offer of his collections to the City. He states that since 1862 he has been occupied in forming a collection of Italian majolica and porcelain, consisting of 300 pieces of the manufactures of Capadimonte, Venice, Bassano, Faenza, &c., of which he has a detailed catalogue, and which has cost him 2,000*l.* He offers to make a gift of this collection to the Civic Museum, subject to the following condition. That the municipality engage to expend an equal sum in the completion of the collection, the outlay being spread over a certain number of years so as not to impoverish the municipal funds. "In Turin," the Marquis writes, "we cannot compete with Florence, Rome, or Naples in museums of Greek or Roman art. We must seek unbeaten paths and things which may stop for awhile the traveller who generally does not look at us, but passes by. A similar collection does not exist in any city of Europe."

THE art critics of Vienna are divided in their opinion of Feuerbach's *Feast of Plato*, which now forms part of the Academy of Art exhibition at Vienna, after having been exhibited some years ago at Munich in the gray and neutral tints in which it originally left the master's studio. Its admirers see in it many of the qualities which were wanting in the painter's *Amazons*, and they specially commend the force and individuality of the faces of the philosophers gathered round the festive board, near which reclines a bacchante-like Phryne, by the side of Alcibiades, whose expression, attitude and form contrast forcibly with the figure of the master himself, which faces the spectator. Less lenient critics consider that the painter has shown his deficiency as a colourist more strongly in this picture than in his earlier productions, and they object to the predominant gray tones, which produce the impression of an over-coloured cartoon rather than that of a finished painting. Feuerbach's picture labours, moreover, under the disadvantage of being hung in immediate juxtaposition with Canon's glowing *Fish Dealer*, in which that brilliant colourist reminds one rather of Rubens and Titian than of the masters under whom he has studied.

SIXTY very beautiful and perfect Greek statuettes in terra cotta have lately been placed in the Musée des Antiques of the Louvre. They were brought from Tanara, in Baeotia, by MM. Dumont and Chaplain, and are said to be specimens of very pure Greek art. They all represent women and young girls. Some are standing, others sitting, and many hold in their hands various emblems, by which they can be personified.

A few figures of the same kind are to be met with in the Campana collection, but the latter were found in the Greek colonies of Africa, and are reckoned to be later works.

Many of the statuettes bear traces of the painting with which they were ornamented, and in several of them the carmine of the lips is perfectly fresh. With the exception of two or three, they are wholly intact, and in an excellent state of preservation.

THE learned Society which occupies itself with the history and art of the old town of Paris has resumed its publications, which were interrupted by the war. It announces four works in the course of preparation:—1. *Le Livre des Métiers*, by Etienne Boileau. 2. The tenth volume of the *Histoire Générale de Paris*. This volume is devoted to the seals, armorial bearings, colours, and liveries of Paris. 3. The third volume of the *Topographie Historique et Artistique du Vieux Paris*.

4. *The Cabinet des Manuscrits de la Bibliothèque Nationale*. This last work is an important history of the calligraphy, illumination, and binding of manuscripts before the invention of printing. It is by M. Léopold Delisle.

THE *Union Centrale* announces its fourth exhibition of industrial art for August 10. It will be held, as usual, at the Palais des Champs-Élysées, and will be divided into three principal sections:—
1. Works of modern art, exhibited especially with the view of industrial reproduction. 2. Works of decorative art from the earliest times, arranged so as to form a complete history of costume. This section is the chief speciality of the exhibition. 3. The exhibition of the School of Design in Paris and the departments.

TEN French artists, desirous of testing the popular appreciation of their works, have organised a sale by auction of sixty of their paintings. The catalogue of this sale contains ten etchings that speak well for the merit of the works offered to the public. The artists who offer them in this manner are MM. Dalipharel, Daubigny-Karl, Feyen-Perrin, De Groiselliez, Hanoteau, Jundt, Lapostollet, Lemaire, Mouillon, and Potémont.

A SPLENDID work in chromo-lithography has lately been put forth by the French publisher, M. Marcia. It is the reproduction of the celebrated missal painted by Gonçalves about the beginning of the seventeenth century. The greatest care has been taken to render this reproduction an exact fac-simile of the original. Each page of text, it is stated, has been placed fourteen or fifteen times under the press, and for the large page illustrations as many as twenty and four and twenty lithographic stones have been used, each bearing a different colour. It is not often that the jealously-hidden treasures of the art of the Peninsula are thus popularised.

M^{ME}. LENOIR, formerly proprietress of the Café de Foy, in the Palais Royal, has left by her will, besides six millions of francs to hospitals, a large and important collection of works of art and curiosities of every kind to the nation. Her collection of snuff-boxes alone is valued at 500,000 frs. Of the old Café de Foy, now changed into a bazaar, there remains only a swallow painted on the ceiling—the work of Horace Vernet.

IN connexion with the re-opening of the Worcester Cathedral, Mr. J. Severn Walker has issued an interesting summary of the history of the fabric, enabling the reader to see at a glance the changes it has undergone during eight centuries and a half. The present cathedral is the third that has been erected since the bishopric was founded, and owes its origin to Bishop Wulfstan, who built the Norman crypt in the year 1089. King John, who was buried in front of the high altar (about fifty feet westward of the present altar), gave 100 marks to the re-edification of the cloister and offices, and what may be termed the growth of the building proceeded from his time until the beginning of the sixteenth century. Then commenced a period of destruction and disfigurement, which culminated during the Parliamentary wars. The cathedral was twice desecrated, and under the date July 23, 1646, we have this entry:—"This day many gentlemen went to six o'clock prayers to the college, to take their last farewell of the Church of England service, the organ having been taken down the 20th." It cannot be said that the Restoration made much improvement in matters, but it was reserved for the eighteenth century to mutilate from sheer stupidity that which the iconoclasm of the past had spared. The works which have just been brought to a close were commenced in 1857 under the superintendence of the late Mr. A. E. Perkins, architect to the Dean and Chapter. He was bold enough to remove the debased east window (inserted in 1789), and to substitute for it ten lancet lights in two tiers. By him also the south end of the eastern transept was rebuilt, and the whitewash carefully removed from the choir and

Lady Chapel. From 1860-1867 the restoration of the cathedral proceeded by slow degrees, much labour being spent upon the removal of the debased work of the last century. Since 1868 a fresh impetus has been given, and our space will not permit us to detail the elaborate embellishments which have been bestowed upon the interior of the fabric. The chief benefactors have been Lord Dudley, Sir E. Lechmere, the Bishop, the Dean (who gave the very beautiful reredos in 1868), and several members of the caputular body. It is only fair to add that the repair of Prince Arthur's Chapel and the renovation and gilding of King John's effigy were undertaken at the cost of the Government Board of Works. Mr. Perkins died last year, but, until the time of his death, the entire work of restoration was carried out under his personal superintendence, and all the external work and additions to the fabric were made by him. The fittings and decorations of the choir, the magnificent pulpit of marble and alabaster (one of Lord Dudley's gifts), the pavement, inner vestibules, and seats in the nave were designed by Sir G. G. Scott, R.A.

THE current number of the *Zeitschrift für Bildende Kunst* is principally occupied with a memoir of the late Edward Schleich. A portrait of Schleich and an etching from one of his landscapes are given in illustration.

The other articles of the number are a continuation of Iwan Lermoliev's "Galleries of Rome," translated by Dr. Johannes Schwarze; the never-ending Vienna Exhibition article by Jacob Falke; and a review of Dr. Dobbert's pamphlet on Niccolò Pisano. To many persons the attraction of the number will lie in an etching, by E. Forberg, of a girl's head by Greuze.

THE STAGE.

"THE CLANDESTINE MARRIAGE" AT THE GAIETY THEATRE.

HOGARTH, when he produced the prints of *Marriage à la Mode*, was not only in full possession of his powers, but was in full repute. It was in seventeen forty-five. The *Rake's Progress* and the *Harlot's Progress* had won for him the public ear or eye, and *Marriage à la Mode* could be executed with the cheerfulness which gives an added strength to strong work done in popularity. No wonder, then, that it shared the fate of strong work done under such conditions, and came to be translated, so to say, on the stage; and in a form more complete than that in which in our day a work of a totally different kind has come to be translated. The reader may remember how Gêrome's famous picture of Molière and his Sovereign has been realised quite lately on the French stage; and how in a very pretty little comedy of Mr. Craven's the last tableau did but reproduce Mr. Calderon's popular and graceful picture of the *Broken Vow*. Well, Hogarth's *Marriage à la Mode* had, of course, a greater influence. Being itself almost a novel, it could suggest a play. But it was twenty years after it had first brought its grim amusement to the town that David Garrick and George Colman made it the basis of a manufactured comedy: a comedy which, as Mr. Hollingshead tells us in his very instructive little note on the playbill, stood indebted in an even more obvious way to another stage piece than to the work of Hogarth; since three of its characters (Lord Ogleby, Sterling, the city merchant, and Brush, Lord Ogleby's body-servant) were taken straight from a farce by the Rev. James Townley.

The title, *The Clandestine Marriage*, does not give a very fair idea of the main interest of the play, which does not really lie so much in the fate of the two people who are secretly married before the play begins, and whose marriage affords opportunity for the complications that occur, as in the character of Lord Ogleby. There are other characters that are carefully presented, but they

are not original conceptions, and Lord Ogleby (save for his part in the old farce) probably is an original conception. He is imagined with some penetration, and developed with much lucidity. In a word, he is of those borrowed things that become original by the excellence of their execution and by their appropriateness to the scene in which they are placed. Dickens, who during part of his youth went every night to the theatre, had seen, probably more than once, this play of *The Clandestine Marriage*, and were it not that his own fertility was until his middle period, so unbounded that it was easier for him to invent wholly than to borrow even a little, one might have said that this character of Colman's (since Colman's surely it is in its completeness) had suggested the Mrs. Skewton of *Dombey*. Ogleby is a male Mrs. Skewton. There is one difference between them, but we don't find that till the end of the play, when it turns out that Lord Ogleby did keep a kindly heart for this world, though, like Mrs. Skewton, he had no soul for another. Elsewhere though, test the characters where you will, and the resemblance is complete, though Lord Ogleby's language is always terser and better, his breeding much higher, than Mrs. Skewton's. The vanity of both leads both to meet the world with manufactured countenance: rouge and false teeth, and cunning dyes and padding, deceive Lord Ogleby and Mrs. Skewton themselves much more than they deceive the society which they are meant to fascinate. The old young man and the old young woman—the aged peer who is sustained by "palsy drops" and "surfeit water;" the aged Cleopatra, whose dying wish is for "rose-coloured curtains"—each thinks that he or she possesses for the other sex a potent charm; and yet each knows that Age is here, and each watches nervously for every outward sign of it. Both cherish the spirit which regards every new wrinkle as an unwarrantable affront, and every grey hair as a personal enemy. For these people the dignity of age would be a phrase without a meaning. Yet Lord Ogleby is not altogether contemptible. He lives for this life more frankly than most people, and makes the choice of Demas quite calmly and deliberately, and with excellent breeding—"having loved this present world." The ingenuity which suggests that he shall object to a long stroll round the park, lest his host's gout should interfere with the pleasure of the walk, might have done society some service, turned into another channel; and the valour which makes him ignore his agonies of rheumatism, when he wishes to bow his homage to the young beauty of the house, is of itself a moral lesson. There is a good deal of grace in the way in which, at last, he accepts the surprising news that he is himself deemed a less eligible husband than some younger but less important man. The thing is a matter of feeling, he allows, and he has himself the full possession of what is our greatest incentive to toleration—"I indulge my own feelings far too much to wish to tyrannise over other people."

Every phase of this character Mr. Phelps presents to us with extreme carefulness, and with a restrained art that measures all its effects. He is good as he sits in the arm-chair, as yet but half clad in his chamber gown, and exhausted with the effort of the first dressing; good, as he rests there waiting to gather strength to proceed—stayed with "palsy drops" and comforted with peppermint—good, when he is interrupted by his host's knock at the door, while he is putting on a little rouge in secret, and ready at once with a polite message: as ready with that as with an inward imprecation. Very gently and discreetly too does Mr. Phelps indicate Lord Ogleby's kindness, now verging on the point of tenderness, for the Swiss servant who invariably flatters him, and the genuine admiration which mixes with his vanity when Fanny Sterling, his host's daughter and the heroine of the piece, makes to him an avowal of love for another, which he takes to be of love for himself.

Fanny is a heroine who succeeds in being worshipped by an encumbrance of lovers. Perhaps it is a weak point in the play that we have to take her qualities on trust, and do not know why she is preferred to her sister. Or perhaps a more thoroughly accomplished *comédienne* than Miss Loseby might throw us a fresh light on the character. Miss Loseby's performance is earnest and meritorious; but it is conceivable that the part has possibilities which the lady is not fortunate in bringing out. Miss A. Baldwin plays the elder sister with some grace, yet perhaps with a certain absence of freedom. Mrs. Leigh plays the vulgar aunt, who is really mistress of the merchant's house, with more of energy than humour. But one cannot think very hardly of a failure to interest in these characters, when much of the failure may so well have its source in the work of the dramatist. Mr. Charles Harcourt is Sir John Melvil—one of the several lovers who compete for Fanny. Mr. Vezin's qualities are rather lost in Lovewell. Mr. Maclean is the city merchant, father of the girls. Mr. Soutar is successful as the Swiss servant. And Miss Farren brings brightness and intelligence, if also a little mannerism, to the acting of a very small part—that of a chambermaid nearly related to Lucy of *The Rivals*, and to half-a-dozen fast chambermaids of eighteenth-century comedy.

The piece is placed upon the stage with no special attention to scenery and costume. Mr. Sterling's park is a very ordinary series of stage glades; and in a drawing-room of the year seventeen sixty, or thereabouts, one recognises chairs of the severer period of the First Empire, some forty years later. Mr. Hollingshead does not often err on the side of poverty in his appointments. Is it malicious to add that he errs as seldom on the side of magnificence? But the acting of Mr. Phelps makes it worth while to see *The Clandestine Marriage*, and to see it in a temper undisturbed by accessories.

FREDERICK WEDMORE.

Nos Bons Villageois was played at the Princess's for the last time on Monday; and, on Tuesday, Madame Marie Laurent—who had been performing in Paris on Sunday—made her first appearance here this year, and chose a work of Balzac's, *La Marâtre*. *La Marâtre* does not hold in the short series of Balzac's dramas by any means the place which is filled by *Mercadet le Faiseur*—known to the English through Charles Mathews's acting in *A Game of Speculation*—but it is well enough adapted to display the ability which has long been recognised in Madame Marie Laurent.

Is it getting to be an understood thing that subjects for burlesques are well-nigh indiscoverable, and that before we can have many more good parodies somebody must write good things which lend themselves to parody? At all events, the stream is setting in the way of what are called "musical absurdities," which don't profess to satirise anything in particular, but, with their music for accompaniment, design to make us laugh at things in general. *Normandy Pippins* is the name of the "musical absurdity" which was to have been brought out at the Criterion on Saturday—but which was not ready when the evening came; and *Peacock's Holiday* the name of a "musical piece" written by Mr. Herman Merivale, and produced on Thursday at the Court. This last piece is avowedly founded on *Le Voyage de Monsieur Perrichon*, which the French players, then at the Holborn Theatre, lately found to be amusing to Londoners.

MR. BATEMAN has decided, no doubt very wisely, not to produce at present another play for Mr. Irving. Mr. Irving's "creations," each of them of considerable importance, have crowded upon us during the last two or three years; and his next new part will excite a keener interest if it be for some time delayed. Meanwhile, the four great parts played by him at the Lyceum before Philip, in which he is at this moment appearing, can be

played over again, each in its proper turn; and this will be very interesting to the artistic public, and will give to Mr. Irving an honour like to that enjoyed by the poet whose complete and collected edition of his works is produced while he is still in his activity. Mr. Irving comes again, so to speak, before the reviewers. His work will be surveyed almost from end to end. But what experiment is to follow these revivals? Will Mr. Irving act Hamlet, after all, as stage report said he was going to do?

On Wednesday night the Royalty opened for what is called the "summer season," with light entertainments befitting the tropical character of an English April.

WHY are the worlds of literature and the theatre held by common consent to be so much separated, that there is nothing unusual in bestowing on a play a name which has already been given to a book? At the Queen's to-night they produce a play entitled *Fair France*. Probably nobody on the stage recollects, or even knows, that that was the name chosen for a book of Essays by the author of *John Halifax*, and probably the good people who read the essays will not hear much about the play. A more noteworthy instance occurs to us in the case of the title *Caste*, which was the name of a successful novel long before Mr. Robertson made it the name of a still more successful comedy.

WE are informed that a new comedy is in rehearsal at the Haymarket, and that it is to be called *Mont Blanc*, and that it is to be strongly cast, with Mr. Buckstone in the leading part. Sketches of *Mont Blanc* have lately been made upon the spot, so that there shall be accuracy in stage scenery, costumes, and properties. Nor is the precaution unnecessary. There is a certain disadvantage, which of course boldness may overcome, in laying the scene of comedy on such familiar ground. The inhabitant of Bayswater knows nothing of Bloomsbury, and the dweller in Islington is very innocent of any knowledge of Mayfair, so that the dramatist of London life, if he be careless or false in his work, may still escape detection; but every Londoner will be able to sit in judgment upon the accuracy of a representation of *Mont Blanc*.

WE understand that Mr. Dion Boucicault intends returning to London from America early in May, in order to produce at one of the leading theatres his new comedy of *Led Astray*, which has created such a sensation in New York. He will bring with him three of the principal comedians engaged in the successful production of the piece in the States.

MME. CHAUMONT will play at Brussels during the month of May, and may afterwards be expected in London.

Jean de Thommeray, the most recent work of Emile Augier and Jules Sandeau, is still performed once or twice a week at the Théâtre Français, and the part played by Mde. Favart is being "under-studied," as the phrase is, by Mde. Lloyd, who will play it should the piece require to be acted during Mde. Favart's absence from Paris, on her visit to London.

Les Deux Orphelines—the successful melodrama of the Porte Saint-Martin—has been, we hear, adapted for a London theatre.

Mlle. AGAR, who was for some time the leading actress in what they call the *grand répertoire* at the Odéon—interpreter, that is to say, of the heroines of Racine and of Corneille—and who was afterward engaged at the Théâtre Français, where her success did not quite equal the expectations that had been formed of her, has just returned to Paris from a long tour at the head of a travelling company in the French provinces. Her reception in the provinces has been extremely cordial.

THE *Débats* gives a short summary of the history

of the French theatre. Actors first appear in the Merovingian period, and are suppressed in the ninth century by Charlemagne. The Troubadours give us an approach to dramatic poetry; the feudal wars replace them by jugglers and mountebanks, who are succeeded by the "Confrères de la Passion," an outcome of the fanaticism of the Crusades. These *confrères*, together with the "Enfants sans souci," were formed into a body by Philippe Auguste, and received letters patent from Charles VI. They represented mysteries in the churches, and afterwards established themselves in the Rue Grenétat, where they performed moralities, follies, and *pois pilés*. Under the protection of the Valois, they finally settled at the Hôtel de Bourgogne, where they had to meet the competition of Gauthier-Garguille and Turlupin at the Théâtre du Marais. Henry III. founded a theatre where the colonnade of the Louvre now stands; and the theatres of Cluny and of the Foire Saint-Germain were opened before the end of the sixteenth century. The arrangements in these theatres were of the simplest character, like those of our own theatres of the same date, where a board was hung out to inform the spectators whether the scene was laid at Rome, Venice, or London; and part of the audience was seated on the stage. An engraving of the time shows us the Petit-Bourbon (where Molière made his first appearance in Paris), when the States-General met there in 1614. In 1639 Richelieu, himself a dabbler in poetry, built the first regular theatre, forming the right wing of the Palais Royal; it was oblong, and the spectators' seats rose in tiers. In 1660 boxes were set up in the Salle du Palais Royal, where Louis XIV. installed, under the title of King's comedians, Molière and his troupe, together with those of the Marais and the Hôtel de Bourgogne.

It is generally thought, but wrongly, that the modern theatre was an Italian invention. Palladio built two theatres in the sixteenth century: one of wood at Venice, and one of stone, which is still standing, at Vicenza; but both were constructed according to the rules of Vitruvius. The theatre of Parma was built by Aleotti, in imitation of the antique; and Nicolas Sabbatini, who wrote at Pesaro in 1637, and specially treats of theatrical architecture, only mentions rooms originally built for other purposes, and fitted up to serve as theatres.

MUSIC.

CRYSTAL PALACE CONCERTS.

As the present series of Saturday Concerts draws to a close, the interest of the programmes is fully maintained. Though containing no absolute novelty, last Saturday's concert presented several attractive features. Foremost among these was the opportunity of hearing a very seldom played work by Beethoven—his Triple Concerto in C (Op. 56), for piano, violin and violoncello. While not in his grandest style, this concerto is in all its movements extremely pleasing. The adagio, though but short, is a veritable musical poem; and the final "Rondo alla Polacca," from the sprightly character of its melodies and the exuberant vitality and "go" which pervade it, leaves a most satisfactory impression on the audience. The work was played to perfection by Mr. Charles Hallé, Madame Norman-Néruda, and Signor Patti—an ensemble of principals whom it would be difficult to surpass. Where all were so thoroughly satisfactory, it seems almost invidious to single out one for special mention; yet it would be unjust to Signor Patti not to recognise his performance of the exceedingly difficult violoncello part as one of the most masterly displays of pure intonation and refined phrasing to which we ever listened.

The symphony was Mendelssohn's in C minor—the first that he published, though the thirteenth which he composed. While far inferior to his well-known "Scotch" and "Italian" symphonies, and occasionally reminiscent (especially in the third and fourth movements) of Mozart's symphony in G minor, it is a work that can be listened to with

much pleasure for its own sake, and which, considered as the composition of a boy of fifteen, is absolutely marvellous. One finds in it, however, much less of Mendelssohn's individuality than in the piano quartet in B minor composed shortly after.

Schumann's overture in E—the first portion of his "Overture, Scherzo, and Finale"—was a very welcome commencement of the concert. Written about the same period as his symphony in B flat, it resembles that work in being more genial in tone and feeling than many of its composer's later works. Its performance was one which, for finish and delicacy, could hardly be surpassed even by Mr. Mann's band—a real musical treat. The concluding overture was Berlioz's "Ber. v. nuto Cellini," which, in consequence of the length of the concert, we did not stay to hear. The vocalists were M^{me}. and Signor Noriny, and the Swedish Ladies Quartet. Of the refined singing of the last-named ladies, mention was made on the occasion of their performance at the concluding Monday Popular Concerts. Both M^{me}. and Signor Noriny created a favourable impression, though both are unfortunately too addicted to the tremolo, without which ornament (?) they seem unable or unwilling to produce a sustained tone.

To-day, a novelty of exceeding interest will be produced in Edvard Grieg's pianoforte concerto, to be played by Mr. Dannreuther. From an examination of the work, which will be shortly reviewed in these columns, we can testify to its great merit and very remarkable originality.

EBENEZER PROUT.

It is officially announced that the National Music Meetings at the Crystal Palace, which were to have been held during the Handel Festival week, will be deferred until next year, when they will be resumed in their integrity, including all the solo and other competitions, as originally designed.

THE prospectus of the coming Handel Festival has been issued. It will, as usual, occupy four days, the dates fixed being June 19, 22, 24, and 26. The music to be performed will consist of the *Messiah*, *Israel in Egypt*, and a selection which will comprise, among other pieces not as yet heard at these festivals, movements from *Saul* and *Susanna*, a portion of the all-but-forgotten *Utrecht Te Deum*, a selection from the *Ode for St. Cecilia's Day*, and one of the organ concertos, to be played by Mr. Best. Sir Michael Costa will, as hitherto, be conductor.

A NEW oratorio, or, as its author calls it, "sacred drama," by Louis Gallet, music by Jules Massenet, entitled *Mary Magdalen*, has been produced at Paris. The *Signale* gives an account of the work, which is of a very serious character, treating of the Crucifixion and Resurrection; and adds that the singular thing in connection with the performance, was that it took place at the Opéra Comique.

VERDI's *Aida* is shortly to be produced at Berlin; the principal parts being sung by Frau Mallinger and Herr Betz, two of the most distinguished of German operatic vocalists.

THE losses sustained at the Grand Opera at Paris, by the recent fire, make themselves felt at the production of every new work. It is said that the mounting of two operas only—*La Juive* and *Les Huguenots*—has cost over half a million of francs.

THE *Levant Herald* learns that M. Pisani, the talented native composer of Constantinople, has at length made definitive arrangements for the production of his grand five-act opera of *Gilana* in Italy, and that it will be put upon the stage with a powerful cast at the beginning of October next, either at the fine lyrical theatre Del Verme at Milan, or at the Communal Theatre at Bologna, one of the first in Italy.

MR. MACLEHOSE'S LIST OF NEW WORKS.

THE SCOTTISH WAR of INDEPENDENCE, its ANTECEDENTS and EFFECTS. By WILLIAM BURNS. 2 vols. 8vo, cloth, 26s.

"Mr. Burns displays a wonderful amount of research, and very considerable critical power."—*Scotsman*, March 27.
"Able and learned—the production of an eminent member of the legal profession in Glasgow. . . . His theory is indisputable—that North Britain has from the earliest period been inhabited by an ardent, energetic, high-spirited, *four* race, who have resolutely and successfully maintained their independence against the incessant attacks of nations mightier and far more numerous than they. . . . The tale of Scotland's wrongs, the patriotic and disinterested ambition of Wallace, the self-seeking of the great nobles, and the high-spirited and generous patriotism of the minor gentry and burghers, have never been so vividly or so accurately portrayed. . . . Mr. Burns's exposure of the errors and unfounded charges of writers like Mr. Freeman is most complete and withering."—*Daily Review*, March 31.

"We take leave of Mr. Burns with sincere respect for his ability, painstaking research, fairness and patriotic spirit, which his work displays."—*North British Daily Mail*, March.

NEW POEM by the AUTHOR of "OLRIG GRANGE." BORLAND HALL: a Poem, in Six Books. 1 vol. extra fcap. 8vo, cloth, 7s. [In a few days.]

SONGS and FABLES. By WILLIAM J. MACQUORN RANKINE, late Professor of Civil Engineering in the University of Glasgow. With 10 Illustrations by Mrs. Hugh Blackburn (J.B.). 1 vol. extra fcap. 8vo, price 5s. [In a few days.]

The POETICAL WORKS of DAVID GRAY. New and Enlarged Edition. Edited by the late HENRY GLASSFORD BELL, Sheriff of Lanarkshire. 1 vol. extra fcap. 8vo, 6s.

"This volume will effectually serve not only to renew, but extend the feeling that the fame and name of David Gray ought not willingly to be let die. Gray's best-known poem, 'The Luggie,' abounds in beauties which should be joys for long, if not for ever."—*Scotsman*, March 27.

"It is a misfortune that David Gray was not permitted to live till the season of ripeness: our misfortune, because, judging from the volume before us, we perceive clearly what he might have been, and with what poetic riches he might have dowered the world."—*Glasgow Herald*, March 28.

WHENCE, and WHAT is the CHURCH?

A Tract for the Times. By a FREE-CHURCH LAYMAN. In crown 8vo, cloth, 4s. 6d.

"This excellent book, thoughtful and suggestive, is by a layman and a Free-Churchman; but though of the laity, he is quite a match for the clergy, and his Free-Churchmanship would liberalise the churches in general, not to say the Free in particular. He is able and accustomed to think, and while he claims and exercises full liberty of thought, he accepts with devout reverence the authority of the written Word of God."—*Glasgow Herald*.

NURSING; or, Full Directions for the Sick Room. By JENEAS MUNRO, M.D. 1 vol. post 8vo, cloth, 7s. 6d.

"If more heads of households were familiar with its teaching, it would save them much anxiety, and the doctor much unnecessary trouble."—*Medical Times and Gazette*.

"Since Miss Nightingale's book, we have not seen so useful and practical a work on the subject as the valuable work before us."—*Standard*.

A SYSTEM of MIDWIFERY; including the Diseases of Pregnancy and the Puerperal State. By WILLIAM LEISHMAN, M.D., Regius Professor of Midwifery in the University of Glasgow. In 1 thick vol. 8vo, (860 pages and 183 Wood Engravings), price 30s.

"In many respects, not only the best treatise on midwifery, that we have seen, but one of the best treatises on any medical subject that has been published of late years."—*Practitioner*, February.

"We have little hesitation in saying that it is, in our judgment, the best English book on the subject."—*Lancet*.

"We can recommend this work as unquestionably the best modern book on midwifery in our language."—*British and Foreign Medical Chirurgical Review*.

SERMONS PREACHED in TRINITY CHURCH, GLASGOW. By WILLIAM PULSFORD, D.D. 1 vol. crown 8vo, cloth, 7s. 6d.

"The sermons have much of the brilliancy of thought and style by which Robertson fascinated his Brighton hearers."—*Daily Review*.

"The preacher, we are made to feel, speaks to us out of the fulness of his own spiritual and intellectual life. He has been under no temptation to borrow, just because he had a message of his own to deliver. . . . He is a preacher because he has been first a thinker."—*Spectator*.

Glasgow: JAMES MACLEHOSE, Publisher to the University.

London: MACMILLAN & Co.; HAMILTON, ADAMS & Co.

NEW BOOKS AND NEW EDITIONS.

FIVE WORKS by FRED. W. ROBERTSON, M.A.

1. LECTURES and ADDRESSES, with other LITERARY REMAINS. Crown 8vo. [Preparing.]
2. SERMONS. Fourth Series. Crown 8vo, each, 3s. 6d.
3. LECTURES on the CORINTHIANS. Crown 8vo, 5s.
4. ANALYSIS of MR. TENNYSON'S "IN MEMORIAM." Fcap. 8vo, 4s.
5. THE EDUCATION of the HUMAN RACE. From LESS-ING. Fcap. 8vo, 2s. 6d.

FIVE WORKS by STOPFORD A. BROOKE, M.A.

1. THEOLOGY in the ENGLISH POETS. Crown 8vo. [Immediately.]
2. CHRIST in MODERN LIFE. Seventh Edition. 7s. 6d.
3. SERMONS, preached in St. James's Chapel. 7th Edition. 6s.
4. SERMONS, preached in St. James's Chapel. Second Series. Crown 8vo. [In the press.]
5. FREEDOM in the CHURCH of ENGLAND. Second Edition. 3s. 6d.

FOUR WORKS by C. J. VAUGHAN, D.D.

1. THE SOLIDITY of TRUE RELIGION. Crown 8vo. [Preparing.]
2. FORGET THINE OWN PEOPLE. An Appeal for Missions. Crown 8vo, 3s. 6d.
3. WORDS of HOPE, from the Pulpit of the Temple Church. Third Edition. Crown 8vo.
4. THE YOUNG LIFE EQUIPPING ITSELF for GOD'S SERVICE. Fourth Edition. 3s. 6d.

THREE WORKS by H. R. HAWES, M.A.

1. SPEECH in SEASON. Crown 8vo, 9s. [Immediately.]
2. THOUGHTS for the TIMES. Sixth Edition. 7s. 6d.
3. UNSECTARIAN FAMILY PRAYERS. [Shortly.]

LITERATURE.

THE SEMPILL BALLATES.

The Sempill Ballates: A Series of Historical, Political, and Satirical Scottish Poems, ascribed to Robert Sempil MDLXVII.—MDLXXXIII., to which are added Poems by Sir James Semple of Beltrees, now for the first time printed. (Edinburgh: Thomas George Stevenson.)

THE "Sempill Ballates" consist of a series of poetical compositions referring chiefly to the stirring events in Scottish history which took place during the later portion of the reign of Mary and under the four Regents, Murray, Lennox, Mar, and Morton, who held the government during the minority of James VI. In them we read the opinions of contemporaries on such matters as the murder of Darnley, the subsequent behaviour of Mary, her deposition, the administration and assassination of the Regent Murray, the distractions of the country, torn asunder by the rival factions of King's men and Queen's men, the death of Lord Methven, the siege and surrender of Edinburgh Castle to the Regent assisted by English forces. Originally published in the fugitive form of broadsides, intended merely to express or to influence the popular sentiment of the day, many of them would have failed to survive to the present time, but for the fact that they were eagerly collected by Elizabeth's envoys or friends in Scotland as evidences of the political feeling of the country, and forwarded to London, where they have been preserved among the Statepapers of the period. Besides those thus rescued, a good many have found their way into the various ballad collections, especially that in the Library of the Society of Antiquaries in London, and the Roxburgh Collection; a few are to be found in the Library of the Faculty of Advocates in Edinburgh, and the collection of Mr. Henry Huth; and for some which are otherwise unknown, we are indebted to the literary industry of John Graham Dalyell, who in 1801 published a collection of Scottish Poems of the Sixteenth Century.

Although the "Ballates," taking as they do different sides in the political controversies of the age, are evidently by various authors, the most important of them have been associated with the name of Robert Sempil or Semple, and hence the collection is not unaptly entitled the "Sempill Ballates." Of Robert Sempil, apart from the fact that his name is appended to several of the original broadsides, little is known. The few notices of him or his works to be found in contemporary records are collected in the preface to the present volume. From these it appears that, on January 17, 1568, a play made by Robert Semple was "played before the Lord Regent and divers uthers of the nobilitie;" and that in the preceding year

(apparently), on February 12, 1567-8, the Lord High Treasurer paid a sum of 66l. 13s. 4d. to Robert Semple, probably in recompense for some similar performance, unless indeed there is a confusion as to the dates, and the occasions are the same. When, in October 1568, George Bannatyne was driven from Edinburgh by that terrible pest which devastated the city, putting a stop to all business, and driving away all who could flee, and beguiled the three months of his country retreat by copying out in a fair hand, on good folio paper, that collection of his country's poems which in the far-famed Bannatyne Manuscript has made his name immortal, he was able to include three satirical poems with the colophon "quod Sempil," dealing with the failings and followers of certain "slicht wemen" of the town in a manner considerably broader than is now thought decorous either in prose or rhyme. Allan Ramsay, who had a keen nose for anything like carrion, of course included these productions in his *Evergreen*, contriving, as was his wont, to make their broad points still "mair braid and plane." These were evidently, from their date, productions of Sempil's youth, and seem to show that he practised his pen upon the social scandals of the day before he launched into the sea of political conflict. The next record we have of him occurs in the Diary of the Rev. James Melvill, who tells that, while he was at Montrose in 1570, the post from Edinburgh used to bring "Psalmes Buikes and Ballates, namlie of Robert Semple's making, wherin I tuik pleasour, and lernit sum thing bothe of the esteat of the countrey, and of the missours (*measures*) and cullors of Scottes ryme." On June 5, 1582, according to Calderwood, "Robert Sempil was takin out of his bed tymeouslie in the morning, by William Stewart, brother of Arran" (favourite of the young King James VI.), "and was sent to Kinnell the next morning, because it was alledged he had received letters from the Earle of Angus." And under 1584 the same authority attributes to Robert Sempil, a Scottish poet, a ballad against the Bishop of St. Andrews, entitled *The Legend of the Lymmar's Life*, a copy of which, it may be added, containing Semple's name, appears in the present collection.

Finally, that Sempil was still alive, though apparently in reduced circumstances, near the end of the century, appears from a sonnet addressed by Montgomery, author of *The Cherrie and the Slae*, to Robert Hudson, who had been a poet and musician at the Court of James VI. :—

"Ye knaw ill gwyding genders mony gees,
And specially in poets; for example,
Ye can pen out tua cuple an ye pleis,
Yourself and I, old Scott and Robert Semple."

According to Dempster, who wrote early in the next century, the poet's death occurred in 1595. Such are really all the facts known as to Sempil, and, in the lack of information, the question of his personal identity has been ingeniously and somewhat idly debated by Scottish writers, some of whom have tried to discover in him Robert, fourth Lord Semple, a nobleman living at the same period, but whose name is innocent of all

charge of poetising, and who, moreover, lived and died a Roman Catholic, while the Sempil of the ballads was not only a Protestant, but a zealous polemic on the side of Presbyterianism.

The literary abilities of Sempil have been estimated very diversely. Dempster, who wrote his *Historia Ecclesiastica Gentis Scotorum* abroad in the early part of the seventeenth century, ascribes to his *carmina amatoria*, "Propertii sanguinem, Tibulli lac, Ovidii mel, Callimachi sudorem;" one suspects that the Father had no knowledge of Sempil's political or ecclesiastical views, else his judgment might have been less favourable. On the other hand, Dr. Irving, in his *History of Scottish Poetry*, finds it "very difficult to discover in his compositions any portion of poetical spirit," a judgment as unreasonable in its depreciation as Dempster's in its eulogy.

Of the thirty-eight ballads here collected, Sempil's name is really appended only to ten, including the three from the Bannatyne MS., and the editor has not attempted to apportion him his share of the others. To do this, indeed, would perhaps not be possible; but it is easy to point out several in the collection which cannot be his.

The series begins with several ballads, deploring the death of Darnley, and charging Mary in no measured terms with being the murderer. She is Delilah, Jezebel, Clytemnestra, Semiramis, the monster of womanhood, for whom no imprecations are too strong.

Passing on, we learn the sentiments excited by Mary's marriage to Bothwell, her defeat and capture at Carberry Hill, imprisonment in Loch Leven, and subsequent escape, defeat, and flight to England. Not until after this, apparently, does a champion of the Queen take up his pen in her defence, to charge the Regent Murray with being the real author of the crimes imputed to her, and as aiming to play the part of another Richard III. :—

"A scholler sure of pregnant wit, and apt for such a place,
Who trayned vp was in the schole of Iyeinge Sathan's grace,
Where he hath learned a finer feat than Richard earst did see,
To doe the deede and laye the blame on them that blameles be.
For he and his companions take agreeing all in one,
Did kill the King & laye the blame the sakeless Queene vpon,
And that this deede to each man's sight might seeme to be most plaine,
They drewe her from her spouse that night by craft & subtilt trayne."

So with all that followed, "Bastard James" was at the bottom of it, skilfully contriving, however, that Mary should appear the guilty party, so as to estrange the people from "their good and vertuous Queene."

Then follow admonitions to the Lords of the Congregation to be up and doing, and especially to resist the restoration of the Queen, which now began to be talked of, the idea being allowed to pass current by Elizabeth, in order to render the King's party still more dependent on herself. That they did so is shown by the complimentary allusions to "the noble Quene of England," which now begin to appear in the ballads :—

"Pray for the Nobill Quene of England,
Quha in our neid still sends us supportatioun,
Hir grace, lang space, may in gude weillfair stand!"

And again :—

"The Lord save Elizabeth, that ane gude woman,
That cauldly and bauldly debat will our quarrell
With men and with money, baith armour and
grayth,
As sche hes afor tyme defendit this Faith.

The Lord send us quyetnes, and keip our young
king,
The Quene of England's Maieste, and lang mot thai
ryng!"

The threats of Spain, which culminated in the Invincible Armada, are thus referred to in this ballad (xxxiii.) professing to be "set out be ane fugitiue Scottisman that fled out of Paris at this lait Murther," i.e. the Massacre of Saint Bartholomew :—

"Now wyse Quene Elizabeth! luik to yourself,
Dispite them, and write thame ane bill of
defyance;

The Papistis and Spanyards hes partit your pelf,
As newly and trewly was tald me thir tythance;
Beleue thay to land heir, and get vs for nocht,
Will ye do as we do, it sal be deir bocht.

Giue, pleis God, we gre sa, and hald vs togidder,
Baith surely and sturely, and stoutly gainstand
thame;

Thay could not weill conqueis vs, culd ye considder,
For our men are dour men, and likis weill to
land thame;

Quhen Cesar himself was chaist, haue ye foryet,
And baith the realmes be aggroit, tak that thay get."

Kirkcaldy of Grange, having been entrusted by his brother Lords of the Congregation with the command of Edinburgh Castle, to their dismay turned sides, and held the fortress in the name of Mary. Before his defection was publicly avowed, a ballad, addressed to him by Sempil, "The Hailsome Admonitioun" (No. xxi.), shows the fears that began to be entertained of his designs; as No. xxiii., "The Captane of the Castell," proclaims the determination of Kirkcaldy to defend his "hauld" against the Regent and England combined. This possession of the Castle was a threat, and something even more serious, to the inhabitants of Edinburgh, and the "Lamentatioun of the Communis of Scotland," No. xxx., shows how the trade of the town and adjacent country was utterly ruined by the "reif and oppression" of the soldiers of the garrison. Robert Lekprevik, the printer of all the ballads which have come down to us with an imprint, now also found Edinburgh too hot for him; he might put his name to ballads calling Mary murderess and whore, while her power was passing from her, but it was a different thing to beard Grange in the Castle, so he fled with his printing-press, first to Stirling and then to Saint Andrews, whence he continued to discharge his broadsides from a safe distance. He returned to Edinburgh in 1572, when the Castle was assaulted with help of English soldiers and ordnance, and his first printed ballad commemorates fittingly "The Siege of the Castel," by Sempil. In this poem the writer speaks as an eye-witness and sharer in some of the operations, and has been supposed to be himself named in the lines—

"Yit Hume and Crafurde to the laue wes gyde,
With certane solouris of the garysoun;
Four Capitaneis followit at thair bak to byde,
Sempill and Hectour, Ramsay and Robesoun."

Those who consider this "Sempill" was the poet, seem not to have read the next lines :—

"But Hume was first that our the wallis wan,
As I heir say, *I wes not thair my sell*;
The Generall says he playit the uailyeant man,
With prayssis mo nor I intend to tell."

Clearly then the "Sempill" who followed at Hume's back was not the writer, who was not thair "his sell."

Shortly after this the Queen's party was completely suppressed; in 1578 the young King took the government into his own hands, and thenceforth the ballads become few. They include "Ane Complaint vpon Fortune," addressed to the King in behalf of the Earl of Morton, lately Regent, but now in disgrace; also one of the most famous of Sempil's compositions, "The Legend of the Bischop of St. Androis Lyfe," in which he batters with merciless severity the *Tulchean* or nominal Archbishop, Mr. Patrick Adamsone *alias* Cousteane, who, though pronounced by Irving "a scholar and a man of talents," was charged with acts of indecency, petty dishonesty, and falsehood, which, now that he was in disgrace, rendered him the butt of those who had envied his sudden rise, and resented his ambition. So far as is known, this is the latest of Sempil's writings, and with it we may leave the subject-matter of the ballades and turn to their form.

The philological interest of the ballades has already been hinted at. They belong to that later portion of the middle Scotch period when the language, like the country, was already rushing into the arms of England. But, in truth, the distractions with which the nation was torn between the French and English sympathisers is reflected with wonderful vividness in the poor language similarly distracted between French and English influences. To the English belong the entire corruption of the native spelling, and such peculiarities as the substitution of Southern *o* for Northern *a* and *u*, in *knowe*, *soe*, *hold*, *whoe*, *doore*, *soone*, for native *knaw*, *swa*, *hald*, *quha*, *dure*, *sune*; the weak, dragging *do*, *doeth*, *done* as auxiliaries; the relative *who*, for native *quhillk*, &c. But along with this one is surprised to find the Scoto-French words about as numerous as at any anterior period, and showing from their use in compositions of avowedly popular character that they had taken a firmer hold upon the language than is generally supposed.

The Glossary appended to the volume is satisfactory so far as it goes; it wants, however, many of the most peculiar words found in the ballads, and some it registers without explanation: such is "wont shone clout" applied to Rizzio :—

"Dany and his, thair state was *wont shone clout*
Our cumly King was of the blude royall:"

that is, Rizzio and his rout were to Darnley no better than a "used shoe-patch."

In the Preface the publisher mentions his obligations to the late W. B. D. D. Turnbull, Esq., of the Record Office, and J. W. K. Eytton, F.S.A., for their assistance in obtaining him copies of the originals. He does not tell us whom we are to hold responsible for the editing of these materials, so far as concerns

the accuracy of the text and arrangement. Indeed one is soon forced to the conclusion that this has been done by that indefinite personage Nobody-in-particular, so slovenly is the execution. The ballades are arranged ostensibly in 'chronological order, but they do not seem to have been read with any care, so as to educe the proper succession from their contents. The result is that in various places they are inserted in confusion; for example No. 9, "a ryme in defence of the Q. of Scotts against the Earle of Murray," in which we find the Regent still alive and vigorous, ought to have preceded not only No. 8, the Infant King's Complaint on account of Murray's murder, but even No. 7, which is, in fact, Sempil's reply to "Tom Trowth," the anonymous author of No. 9. Then also No. 10, which claims to be a vision of the Regent's death, appearing on the very evening of the murder, ought also to have preceded No. 8, which purports to be written after the results of Murray's removal from the scene began to take effect. Even without reading the pieces, suspicion might have been aroused by the fact that No. 9 occurs in Vol. 13 (December 11, 1568), No. 67 of the Scottish Series of State Papers, while No. 7 is in Vol. 14 (August), No. 74. Then surely we had a right to expect a text which, if not up to the standard of the best Early English Text Society's editing, should be free from the blunders which one is pained to stumble upon in this volume. We shall probably be told that many of these only reproduce the printer's errors of the old Broad-sides, but the fact that the volume closes with a page and a half of *Errata*, only four of which (and not all these truly) are excused as being in the originals, affords a test to be applied to the many errors not there corrected, arising mainly from a failure to distinguish letters similar to each other in the Old English type, as *f* and long *s*, *n* and *u*, *r*, *c*, and *t*, *T* and *C*, *li* and *h*, and in others clearly from the misreading of a modern hasty transcript, as where *dune* is converted into *clune*, *gruch* into *grude*. Granting even that a percentage of these is found in the original broadsides, the publisher in his *Errata* admits the principle of correcting them; and, indeed, the unconscious typographical errors of a printed original, left by the inadvertence of a printer's reader, are in a very different position from the peculiarities of a MS. of which the scribe must at least have been conscious. To give a fac-simile of an early printed book is one thing; to print from it is another; and in doing the latter, if we do not correct its errors, we exaggerate them; *f* for *s*, *T* for *C*, a broken-headed *d* for *o*, are very slight inaccuracies in black letter, and at once explain themselves to the reader, while in Roman type they are glaring and embarrassing blunders, which cost even the expert some time to see through. But if the editor had done no worse than give us a fac-simile of the originals, there would have been little to complain of. I have examined many of these, and collated them with the modern printed pages, and am thus able to say that Lekprevik's *Errata* are very few indeed, while those which Mr. Stevenson introduces are legion; the conclusion being that the Ballads were transcribed first of all by an incompetent person, or with a

haste and negligence worse than incompetence; and that they were printed from these transcripts without the proofs being read with the originals, so as to check either the blunders of the copyist or the additional ones due to the printer misreading his already erroneous copy.

JAMES A. H. MURRAY.

Paris et Versailles il y a Cent Ans. Par Jules Janin, de l'Académie Française. (Paris: Firmin Didot, frères. London: Dulau.)

THERE must be for a considerable number of French writers a certain seductive grace in the France of the last century—a fascination that few will regret or can explain. The era of regeneration has yielded less to literature than that of decadence and decay; the Regency has been a richer mine than the Revolution. Pen and brush have wavered and grown weak before Danton and Robespierre; they have dwelt longingly, if not lovingly, on the powdered heads of the meanest of Dubois's recruits and Louis's victims. The paint, powder, and periwig period occupied by the Regency and the reign of Louis XV. has been explored into the darkest dungeons of its bastilles, ransacked into the most secret boudoirs of its palaces: Arsène Houssaye has returned with taffeta flowers and mincing medallions, Lacroix with curious pamphlets, Taine with an unknown Boucher, Sainte-Beuve with a biography, De Goncourt with a fashion-plate. From Jules Barni, the political economist, to Alexandre Dumas, from De Loménie to Monselet, few modern French writers have resisted the *pompons* and patches, the philosophers and comedians, the courtiers and courtesans of a hundred years ago. There was a resemblance between the two mid-centuries that fitted the moralists of one to analyse the immorality of the other. Both were periods of reaction against preceding régimes of hypocritical austerity; both knew their transitory character, and cried *Carpe diem!* remembering yesterday, foreseeing to-morrow. It was the same frantic orgy on a muttering volcano, the same scepticism, the same pomp, the same police—the same paralysis of moral strength, and poverty of intellectual manifestation. Men studied the Paris of Louis the Well-Beloved as a guide to that of Caesar, the Versailles of the Monarchy as an explanation of the Compiègne of the Empire. The society they mixed with gave them clues to the intrigues of that which had died away; if La Montespan was missing, Dubois, Law, and even Richelieu—Anglicised, attenuated, but still retaining their old characters and positions—were visible wherever Tout Paris danced, gambled, wept from the end of its painted lashes, or clapped its jewelled hands. The names had changed, had lost the patrician particles; it was a noblesse whose only obligation was an “obligation Mexicaine”—but this was the only difference. Popular, however, as this similarity rendered the study of the pre-revolutionary era, that study has hitherto been strangely unproductive of any extended view of its subject as a whole. The eighteenth century has been pictured in morsels and miniatures, never by any authoritative writer in its entirety. It has been dissected

by specialists, seldom depicted by historians. The historians were not perhaps wanting, but the century was peculiarly difficult to describe. There is scarcely a stand-point from which a connected survey of the Louis-Quinze era can be obtained. We see a medley of conflicting anecdotes and private memoirs, a chaos of contradictions in morals, in politics, in literature, a Babel of love-whispers and war-cries, philosophic epigrams and courtly compliments. It is a reign of sixty years that has left scarcely one record of greater weight than a *chronique scandaleuse*. The *Fastes de Louis Quinze*, the *Vie Privée de Louis Quinze*, the *Notes de Police* of Sartines, the too famous *Recueil* of Maurepas, these and the innumerable slanderous Gazettes smuggled from Holland constitute the only contemporary history of the epoch.

M. Jules Janin has used these materials as they presented themselves to his notice, without essaying to evolve from their confused mass anything more compact and complete than a series of portraits in pen and ink. He has declined to mount the vacant pedestal of the historian of the eighteenth century, and contented himself with repeating and commentating its anecdotes. There was a golden opportunity, and M. Janin has missed it; but remembering the characteristic work of the first French *feuilletoniste*, we cannot assume that his readers have missed much. The critic of the *Débats* is too irresolute, discursive, and frivolous a writer in his most serious moods to deduce the philosophy of a reign like that of Louis Quinze, a philosophy that was the baby babble of the Revolution, that began in pedantic epigrams in the salons of Mme. de Persan and Mdlle. Quinault, and ended in a significant roll of Santerre's drums on the Place de la Révolution. He has doubtless chosen his part wisely, because that part is not an elevated one. It is that of a chronicler with considerable taste, with a fluent and graceful style, with a light and varied erudition most difficult to control, and a thoroughly accurate knowledge of what pleases the general reader. That general reader would indeed be hard to please who could find no chapter to his mind in *Paris et Versailles*. He is guided through the labyrinth of court intrigues, financier's snares, philosophers' systems, and bourgeois satires by a light and pleasant hand—a hand that pauses at no station long enough to do more than scatter a few flowers of rhetoric. Nor is the guide a flagellant, an irreconcilable hater of the characteristics of the *ancien régime*. He sees in Bourdaloue and Massillon a compensation for Pompadour and Montespan. He bids us admire the Regent performing his devotions in state at Ste. Eustache on Easter Day, and proceeding from the chapel to Mme. de Parabère's hotel in the Place Vendôme, where he feasts in a “chambre tout illuminée et tout ouverte.” “Comme on oublie en ce moment l'Encyclopédie et ses démons!”—the Père Massillon is reading at Versailles, turned towards the King, his sermon on *Le Véritable Culte*; and Mme. de Montespan sits behind the King's chair, likening, may be, the picture of Herod's court to those sacred paintings hanging in the most volup-

tuous boudoirs of the Petite Maison, remembering the *Saint Antoine prêchant aux Oiseaux* in the great billiard room, and reflecting that the painted birds were better listeners than the painted courtesans. There is an effective theatrical side to these pompous professions of faith, but M. Janin has been at pains to discover for them a meaning they never had in reality. Beside Bourdaloue it is permissible to place Dubois and innumerable *abbés galants* whose position in society M. Janin has himself described. With the pulpit denunciations of luxury and royal excess, it is easy to contrast Bossuet's implacable and blasphemous definition of Divine right: “The royal authority is absolute. The prince is accountable to no one for what he ordains. When the prince has judged there is no other judgment. Kings are gods, and share in a manner the divine independence.” If religion was a bath that purified, and occasionally a rod that chastised, in the Regent's Versailles, it was also an efficient prop—an ally that counselled a prompt use of the Bastille and the wheel.

The real religion of Versailles and Paris was that of etiquette and courtesy. It had its professors and bigots no less than the established form; and here the author, having no lofty moral to deduce, is a more acceptable instructor. The spirit of grand ceremonious civility pervaded the bourgeoisie as well as the aristocracy. A bourgeois saluted the bed of a *dame de qualité* and her portrait; his coat was of the colour of his hat; he kissed the noble hand that offered him a biscuit at table; he had a *maître de politesse* to instruct him in all such usages. At court, etiquette was greater than the King. Living, Madame de Pompadour was queen; dead, she was buried like the simplest shopkeeper of the Rue Quincampoix, her lover finding no tenderer requiem than: “Pauvre Marquise, elle s'en va par un bien mauvais temps!” There were public festivities in the house of the Duc de Maine when royal letters patent conferred on him the right to present the shirt and towel to the king. It was in nearly all points a world seen through a reversed telescope. The infinitely little predominated. M. Janin describes, in his *Journal d'une Provinciale*, what the Marquis de Dangeau ingenuously made patent in his Memoirs. The gravest events in this journal of a woman who read Tacitus occupy no more important place than the escape of a canary, the loss of a poodle, the death of a pet monkey. She has never heard of *L'Esprit des Lois*, *L'Essai sur les Mœurs*, the *Encyclopédie*, big as they are with Revolution. Pompadour had just died, the Parliament was banished, the people in revolt, war was imminent, and famine present—and Mdlle. Laurette confides to her journal that her canary is beginning to sing. The bombardment of Calais elicits the simple reflection, “On ne croit pas que cela leur serve à grande chose.” As M. Janin paints them, the omnipotent *philosophes* were scarcely less frivolous than the *provinciale*. M. le Baron de Grimm, even D'Alembert, were the purveyors of scandalous anecdotes to the Baron d'Holbach. For one among the baron's guests the author professes a warmer sympathy. It is Diderot, the incarnation of the literary

revolution, the first *romantique*, by turns tyrannical, indignant, fascinating, seeking Truth right and left, and stumbling over paradoxes; the people's idol, the guest of *grands seigneurs*—whom he never flattered like Voltaire—taller by all his *tête fumante* than the pretty *précieuses* and amateur sceptics of the Encyclopedists' Academy. He had said that there is but one virtue in the world—justice; and litigants came from the farthest provinces to pray to him plead for them, for the virtue was not universally practised under Louis Quinze. It is an obscure and unhealthy, an odious and ridiculous, a monstrous and puerile system of justice that M. Janin describes in the chapters "Une Reine d'un Jour," and "Un Lieutenant Civil de Vingt-quatre Heures,"—a system based on secret delation, and set in movement by the *bon plaisir* of the King. "La Reine d'un Jour" was an obscure burgher's daughter who happened to catch the eye of M. de Soubise, a favourite of M^{de} de Pompadour. Through his agency she could direct all the machinery of the State, confer honours, avenge injuries, ennoble and enrich her future husband, and cause a drunken broil in which he was engaged against some members of the English embassy to result in the expulsion of the insular envoys. The "Lieutenant Civil de Vingt-quatre Heures" was a young *abbé au petit collet*, arrested by mistake, and closeted for a day in the private cabinet of M. Hérault, Lieutenant of Police. He profited by his incarceration to read the quarterly reports addressed to M. le Lieutenant by the twenty-six state prisons, to examine the blank orders bearing the King's private stamp in red ink—the *lettres de cachet* by which all justice was suspended, all rights and privileges abrogated. There was a time when the terrible crimson stamp was affixed by none but the King himself. But Louis Quinze exercised even his tyranny with indolence; the privilege had been left to the ministers, who, in their turn, in many instances left it to their lacqueys. There was a curious confusion of reclamations and complaints on the Lieutenant Civil's table—all awaiting an answering *lettre de cachet*. M^{lle}. le Couvreur complained of the insolence of her rival, M^{lle}. Carton, of the Opera. Two hundred prisoners wrote from the several bastilles that their only crime was having cried "Vive le Roi et périsse la Constitution!" Twenty persons had been detained six years at the Bastille for having refused to accept the condemnation of the ninety-first proposition of the Père Quesnel, which avers that "the fear of an unjust condemnation cannot liberate us from our duty." The Abbé filled up the blank forms with merciful edicts. He commanded the liberation of Diderot; he ordered the Prince de Charolais to restore the wife of the Maître des Requêtes, detained in his *petite maison* at Montmartre; M. de Monthulé to render back M^{lle}. Haudry to her father; M. de Beauchamp, Chevalier de Malte, to repay to M. de Courbon the ten thousand livres he won with loaded dice. All the follies and turpitudes of the epoch were laid bare in that little cabinet of the Palais de Justice, and for all the improvised Lieutenant imagined some well-meant but evanescent remedy.

And the chaotic condition of the police administration was such that the orders were carried out without inquiry: the King had had a paroxysm of philanthropy, that was all. The subject of this adventure was François Joachim de Pierres, abbé, and afterwards Cardinal de Bernis, the minister, and something more, it is said, of M^{de} de Pompadour.

M. Janin avers that he owes as much of his erudition concerning society in the eighteenth century to art as to literature. The assertion is easily credible. The mannerisms and puerilities of Chardin, Oudry, Lancret, Moreau, and their contemporaries, in no way excluded a certain realism, lost under the Revolution. There are domestic scenes by Chardin that revive the old world life in its most intimate details; and what Chardin did for the bourgeois household, Moreau achieved for the frivolities, the gaieties, the elegancies of his time. His *Suite d'Estampes pour servir à l'Histoire des Mœurs et des Costumes au Dix-huitième Siècle*, are bitten in by a cunning satirist's hand. And the etching needle, the brush and pencil were less dangerous tools to hold than the pen. One might put philosophy into an engraving without fear of the dungeon reserved for the author of *Lettres Philosophiques*. Court and Academy recognised art if they ignored drama and philosophy. Chardin was elected one of the Forty, and occupied a *fauteuil* beside Pigalle, to whom the King had offered the cordon of St. Michel. Dilettantism was in the air of Versailles no less than the musk of the Mignons' shirt frills. Louis XV. was a clever draughtsman, Marie Louise excelled in landscape, the Duc d'Orléans produced a commendable *Daphnis et Chloé* and the famous pictorial witticism *Les Petits Pieds*. There was, in truth, no lack of appreciative Maecenases in Paris and Versailles; but M. Janin has dwelt somewhat too complacently on these sunnier sides of the era. His work ends fitly with a sketch of Mirabeau, but it is the Mirabeau of drinking bouts, of the Letters to Sophie, not the revolutionary tribune. And this avoidance of all earnest enquiry and analysis is observable from beginning to end of *Paris et Versailles*. It was natural enough—inevitable indeed—in an historical study by Jules Janin; but it is impossible not to regret that with such materials the author should have produced nothing more durable and dignified than a digressive and disjointed *causerie*, that skims but never plunges, amuses but never moves or enlightens. EVELYN JERROLD.

The Constitutional History of England in its Origin and Development. By William Stubbs, M.A., Regius Professor of Modern History. Vol. I. (Oxford: at the Clarendon Press, 1874.)

THE Delegates of the Clarendon Press are to be congratulated upon this book, the last addition to the valuable series of works issued under their auspices. While the Syndics of the Pitt Press at Cambridge are chiefly occupied in publishing Bibles and cribs (both useful in their way), the Delegates of the Clarendon Press have produced a series of works which reflect credit, not

only on the authors, but also on the university. Not the least important is this history of Professor Stubbs, which is calculated to supply a distinct want in our historical literature. We had no work upon English institutions which brought together the results of modern study and research. The fragment—and it is little more than a fragment—of his History of the Middle Ages which Hallam devotes to the subject only indicates the general outlines of the foundation of our constitutional history, leaving the reader to fill in the picture in its details by reading the numerous works on different parts of the subject. Mr. Finlason, in his edition of Reeves's *History of English Law*, has, it is true, endeavoured to fill up the gap, but the distinguishing features of that book are the divergence in opinion between the author and the editor, and the attempt to trace every existing institution to an origin in Roman law. Until the publication of Mr. Stubbs's books there has been no modern author who has endeavoured to write the history of the English Constitution as a whole, guided by the light that German scholarship and the publication of our national records have thrown upon it.

In this volume we get the first instalment of the work, giving the history to the year 1215, the date of John's Great Charter. It will be remembered that some few years ago Mr. Stubbs published a most useful volume, the text of the more important of our early charters and laws—in fact, the evidence upon which his present history is based.

The first three chapters give us an account of the German origin of our institutions and our German ancestors. Based mainly upon the statements of Caesar and Tacitus, Mr. Stubbs gives us a vivid picture of what our German ancestors were, and what was the life they led, before—impelled either by the spirit of plunder, or conquest, or both—they started upon those expeditions that ended in the settlement of England. Mr. Stubbs's explanation of the vexed passage in which Tacitus states that the Germans divided their land "*secundum dignitatem*," that cattle and slaves were their chief articles of property, that wealth in cattle involved of necessity a proportionate part of pasture and meadow, and wealth in slaves a larger share of the arable land, is certainly ingenious.

Mr. Stubbs advocates, and rightly advocates, the view that the importance of the Welsh laws upon our history has been greatly overrated, and that the Welsh laws we have are of so late a date that it is most probable that the points in which they resemble the Saxon laws were taken by the Welsh from the Saxons, not adopted by the conquerors from the conquered. Among the many doubtful points we have in our early history, this one at least seems clear, that there are none of our existing institutions to which we can assign a genuine native origin.

The subject of the settlement of the land is one of the most important elements, if not the most important, in our constitutional history; and here, while agreeing with Mr. Stubbs in holding that the original allotment of land was based upon the mark system, we differ from his view that, "at the opening of Anglo-Saxon history, absolute ownership

of land in severalty was established and becoming the rule." All the evidence seems to us the other way. Community of ownership was the principle upon which all the Saxon land settlement rests, and the great extent of common field land that exists to this day in England attests to the universality of the custom. Mr. Stubbs seems to be of opinion that there were three distinct classes of land—that held by individuals in full ownership, the bocland; that of which the ownership was in the State, the folkland; and the intermediate class, of which the ownership was held in common by the communities. But we fail to see how this theory is borne out by the evidence. The land was either private or public; there does not in early times—or really at any time—seem to have been a threefold division. The "ethel," as Mr. Stubbs terms the inherited land held in private ownership, may have been the origin of bocland, but the evidence upon which this proposition rests is very slight. Mr. Stubbs himself shows that the term "ethel," as applied to landed estates, is a modern, not a Saxon term. That private property in land existed before writing was known is most probable, and that writing formed no necessary part of the transfer of ownership of land, and was only used as a convenient form of evidence, is abundantly clear; but the fact that we have so few examples of the early transfer of land would tend to prove the small area of the bocland. In addition to this, the bocland was exempt from taxes to which the majority of the land was subject, thus proving by the fact of its exemption that its area was but small compared to that which paid taxes. As a rule it included merely the house, garden, homestead, and a small enclosure or two for rearing the young stock; but the bulk of the land belonging to each village was annually allotted, and was regarded, not as the land of the individual (bocland), but as the land of the inhabitants (folkland). Neither can we admit that the ownership of the folkland was in the State in the modern sense of the word. The village, the community, was the owner. The State, the kingdom, had nothing to do with the cultivated lands under the early Saxon system. It is under a new order of things, a totally different set of ideas, that the notion of the land being the land of the nation arose.

Mr. Stubbs very clearly shows another important point, which we are too apt to forget—that the mere possession of land was not regarded as the qualification of the free-man for political rights. Our notion that a man's position in the State was determined by the quantity of land he held, though strictly true in later times, seems to have had no place in the original Saxon settlement. Baronies by tenure, and the rule that holding lands worth 400 marks a year made a baron, 100*l.* a year an earl, 20*l.* a knight, were ideas as strange to the Saxons as to ourselves. With them the qualification for political life was personal distinction. A man was elected for other qualities than his mere acres; and one of the great changes that the Norman conquest produced was the confirmation of the idea that had been gradually growing up, that titles of honour were real, not personal property.

The idea of elective dignities pervades the whole Saxon system, from the tithing man to the King. In theory the sovereign was always elected, and the hereditary right, if it existed at all, was always subject to the elective right of the people. Mr. Stubbs thus states the principle:—

"The choice was limited to the best qualified person standing in close relationship to the last sovereign."

It was something very analogous to the Irish custom of tanistry, the selection of the eldest and worthiest. And the king, when elected, was a very different person from our modern king. He was

"neither a mere ornamental appendage, nor a ruler after the imperial model, not the supreme landowner, not the fountain of justice, not the autocratic maintainer of the rights of subjects who derive all their rights from him. But the representative of the unity, dignity, and of the historical career of his race, the unquestioned leader of the host, the supreme judge of appeal."

He accurately described himself as "King of the English," not as "King of England." If the President of the United States led the American armies to battle, he would more resemble an Anglo-Saxon king than an English sovereign now does. Of course the parallel is far from perfect, but the idea is the same, and the position and rights of each are in many respects analogous. It is this position of the king that is the true explanation of the union of the small kingdoms under the House of Cerdic. A leader and a representative of the country was required, and the necessity for that leadership led the tribes to unite in selecting the man best fitted for their needs. In the House of Cerdic they found what they required, and the struggle with the Danes helped to continue its ascendancy. But the elements of disruption were there: the king had only a nominal sovereignty over the greater part of his subjects; the local leaders, under whatever title we like to give them, exercised local jurisdiction, raised the local contingents to the national hosts, and prepared the way for the great earldoms of Canute, for the feudal system. Indeed, though we may not meet with the name of feudalism under the Saxon kings, we find, as Mr. Stubbs points out, that

"the great earldoms of Canute's reign were perhaps a nearer approach to a feudal division of England than anything which followed the Norman conquest."

The changes produced by that event were far more nominal than real. The great change—and this is a nominal one—which is the key to all the others, is that the king became the Supreme Landowner, and in consequence of this, at the Council of Salisbury William compelled all the inferior as well as the superior landowners to swear allegiance to him. This act of William was in reality the destruction of feudalism in England. It severed, in a way wholly foreign to the primary idea of that system, the personal tie between the lord and vassal—by compelling the vassal to recognise that there was a person above his lord to whom he owed allegiance; that as between subject and king the words of the vassal's oath to his lord, "I become your man," were meaningless. As Mr. Stubbs truly says:—

"In this Act has been seen the formal acceptance and date of the introduction of feudalism, but it has a very different meaning. The oath described in the oath of allegiance, combined with the Act of Homage, and obtained from all landowners whoever their feudal lord might be. It is a measure of precaution taken against the disintegrating power of feudalism, providing a direct tie between the sovereign and all freeholders, which no inferior relation existing between them and the mesne lords would justify them in breaking."

To us this oath seems the keystone of the greater part of our subsequent history. Its direct effect was to show that the land was the king's land, and not the people's; hence it is that we never find after the Conquest the expression of folkland, but always "Terra Regis." From it flowed the rule, that for every yard of land in the kingdom some one was responsible, and owed allegiance, and hence arose the doctrine that allegiance was territorial, not personal, a doctrine that culminated in the maxim *Nemo potest exuere patriam*. It also gave security for the peace of the kingdom. If the landowner conspired against the king, he broke his oath of allegiance to the king, and hence forfeited his lands, not to the lord, but to the king. It was thus the interest of the lords to prevent their vassals from engaging in conspiracies, for if they did the lords lost their lands. And so it became a matter of the utmost importance to the lords to have the offence of treason, the betrayal of allegiance, distinctly defined. And the Statute of Edward III., which has always been the standard of the law of treason, carried out this principle. The object of the lords in getting this declaration of the law from the king, was not so much a love of liberty as a love of their own pockets; it was not to determine who were and who were not traitors so much as when the forfeitures were to go to the king and when not. Of course it was one of the chief objects of the lords to limit the number of the royal forfeitures as far as possible, and it is to this cause that the continual reduction of the offence of treason to the limits of the Statute 25 Edward III. is to be ascribed.

The changes produced by the Conquest are well summed up by Mr. Stubbs:—

"No new England is created; new forms displace, but do not destroy the old, and old rights remain, although changed in title and forced into symmetry with a new legal and pseudo-historical theory. The changes may not seem at first sight very oppressive, but they opened the way for oppression."

To one of these changes—nominal, indeed, but really of the utmost importance—we do not think Mr. Stubbs gives sufficient weight—the appointment of the sheriffs by the Crown. Indeed, Mr. Stubbs states that "it is probable on early analogy that the 'gerefa' was chosen in the folkmoot, but there is no proof that in historical times this was the case." But here we differ from Mr. Stubbs: the inference from the present election of the sheriffs for London and Middlesex, the election of the sheriff's deputy, the coroner, by the freeholders, leads us to think the commonly received opinion to be the true one, that the sheriff was elected by the freeholders, and the express recognition of this right of election by Edward I., when the freeholders were becoming strong enough to

claim their old rights, strongly confirms this view. As Mr. Stubbs states, the "Norman lord who undertook the office of sheriff had more unrestricted power than the sheriffs of old." But the change was more than that, it was the substitution of an official who was a royal officer for one who was the people's officer. It was a change from self-government to personal government, and it was this official's duty to get all he could for the king, a duty he did not neglect, as he had paid for the office and made what he could out of it. In every shire in the kingdom there was a representative of royalty, the chief man in the shire, in whose discretion it was whether the law should be harshly or fairly administered. One example of how the sheriffs executed their office will show what the conduct of the sheriffs was. The Sheriff of Worcestershire in *Domesday* complains that there were so many exemptions in his shire that he could not make it pay. What a picture this gives of the royal officer exacting every penny in the name of his sovereign! Nothing could have brought home to the English the idea of their conquest so forcibly and keenly as the Norman lord installed in the place of the Saxon sheriff.

Mr. Stubbs seems to have fallen into an error in his comparison of the heriot with the relief:—"The heriot of the English earl or thegn," he says, "was in close resemblance with the relief of the Norman count or knight." We hold that the two were totally distinct, and arose from a totally different state of circumstances.

To the heriot all our legal antiquaries have ascribed a Danish origin. It was the lord's right to the arms of his dead tenant. The Danish settlers, who would probably arm their dependants at their own cost, would not let the tenant's family on his death dispose of the arms, which might in all probability be used against them, so the lord stepped in and took them for his own use. At first clearly the arms were the tenant's most valuable chattel, and in time the custom grew up that the lord might take, not the arms, but the best chattel his tenant had. To this day, as a rule, the right to a heriot is a right to a specific chattel, not to a money payment. The relief was the payment by the heir for the possession of his ancestor's lands, it was a bribe to the lord to place the child in the father's place. It was not a specific chattel, but always a sum of money. It dates from a time when the right to succeed the ancestor had no legal existence, when succession was regarded as a favour, not as a right. And it would seem that this relief was at first arbitrary: the lord fixed the consideration at which he would sell to the heir the right to succeed. One of the first clauses in *Magna Charta* settles the amount of relief, and turns into a right what had originally been only a favour.

One of the great points that tended more than any other to the unification of the kingdom, and to the idea that the king was the ruler of the people, bound in return for their allegiance to protect their lives and their goods, "the king's peace," seems to have met with but scant treatment from Mr. Stubbs. This doctrine seems to us to have

changed the whole of our early law. Offences were originally offences against individuals, and were regarded as wrongs, not as crimes. If the King had granted his protection to an individual, then the matter became, not merely a sin against the person wronged, and punishable by a fine to him, but also an offence against the king for violating his protection, and punishable as well as an offence against him. This peace, first granted to individuals, then to districts, then to the whole country, was the foundation for all crimes being punished by the State, and has, with the law of forfeiture, been the cause of the change from what Blackstone terms "private wrongs," to "public wrongs." If a person committed an offence against the king's peace, his goods and chattels were forfeited to the king, and it was useless for a private person to proceed against him, as the accused had no goods to pay his wergeld. A relic of this we see at the present day in the legal rule that in cases of felony, if a civil and criminal remedy coexist, the criminal must be taken first, because the Crown, by its prerogative, would thus get the first chance of the forfeiture, while in cases of misdemeanour, where there was no forfeiture, both might be taken concurrently. Thus in the old law as to appeals for murder, the suit of the king always went before the suit of the relatives. So far was this idea of the king's peace carried, that on a new reign, if a crime was committed before the king's peace had been proclaimed, it was held such crime was not punishable at the suit of the king, for the late king's peace expired at his death, and the new king's peace had not been proclaimed. It will be remembered that all the old indictments for felony concluded with the words "against the peace of our Sovereign Lord the King, his Crown, and dignity," thereby bearing modern testimony to ideas that had long been obsolete.

Mr. Stubbs appears also to share the general opinion that the main features of our Constitution are more Norman than Angevin. To us this does not seem the case. The total abolition of all regular government under Stephen left but one or two great principles of the Norman rule of William and his sons which have become engrafted upon the English law. Most of the changes usually ascribed to the Normans are in reality changes introduced by Henry of Anjou. To him, if to any one man, it is that we owe our Constitution. Upon the great substratum of English law and custom, the surface only of which the Conqueror had disturbed, upon the disorganised relics of the Norman polity, Henry built up the system under which we live. Hallam's statement that there are

"no essential privileges of our countrymen, no fundamental security against arbitrary power so far as they depend upon positive institutions, which may not be traced to the time when the House of Plantagenet filled the English throne,"

would be equally true if for the House of Plantagenet we read Henry II. He laid the foundation, Edward I. completed the work; but Henry was the author, Edward only the editor. We think that Mr. Stubbs hardly metes him out his full meed of praise in the following passage:—

"Henry II. is the first of the three great kings

who have left on the Constitution indelible marks of their own individuality. What he reorganised Edward I. defined and completed. The Tudor policy, which is impersonated in Henry VIII., tested to the utmost the soundness of the fabric. The Constitution stood the shock, and the Stuarts paid the cost of the experiment. Each of the three sovereigns had a strong idiosyncrasy, and in each case the state of things on which he acted was such as to make the impression of personal character distinct and permanent."

Mr. Stubbs seems to be of opinion that John's barons were really acting on a great and patriotic love of liberty in obtaining the Charter, not merely seeking redress of their own grievances. He says: "the demands of the barons were no selfish exaction of privilege for themselves," and in support of this says, "that in any case in which the privilege of the simple freeman is not secured by the provision that primarily affects the knight or baron, a supplementary clause is added to define and protect his right." We regret we cannot agree with him. We do not believe that any idea of liberty for the people ever entered into the minds of John's barons; the whole Charter is a treaty between the king and the barons, with regard to the king's right to oppress his subjects: the king is not to oppress the baron, or the baron's vassals, the freemen; but there is nothing to say that the barons are not to oppress their vassals, and that the barons did so, the Statute Book clearly shows. Community of suffering may have induced community of interest, and the barons may have at first felt for their fellow-sufferers; but that such feeling was lasting, or was used for more than the temporary purpose of exacting greater concessions from the king, we do not believe. The one subject of oppression and of early legislation is the tenure of real estates. If we deduct the provisions as to that and as to procedure, we have very little of the *Vetera Statuta* left.

Though we differ on several points from Mr. Stubbs's conclusions, we can conscientiously recommend his book to all those who take an interest in our early constitutional history. In no other book that we know of is so much information on the subject contained. No other author that we know of has brought more learning and research to bear upon the general subject of our social history. It is a book that will at once take its place as the book for students, the source of information for those who, to use Mr. Stubbs's words, "would learn how the present comes to be what it is."

J. W. WILLIS BUND.

Central Asia and the Anglo-Russian Frontier Question. A Series of Political Papers. By Arminius Vambéry. Translated by F. E. Bunnnett. (London: Smith, Elder & Co., 1874.)

THIS is the translation of a series of articles by which Mr. Vambéry has from time to time during the last five or six years endeavoured to awaken hostile interest in Russian progress in Central Asia among the readers of *Unsere Zeit*. The principal motive for republication in the present form would appear to be the author's desire to attract attention to his prognostications of future

events, by triumphantly pointing to the fulfilment of his earlier predictions.

This might perhaps have been done with more convenience to his readers, and equal satisfaction to himself, by a single connected narrative of the Russian advances, with references or quotations from his prophecies. The book, as it is, conveys no new information to those who understand the subject, and is too disconnected and full of repetitions, not only of facts, but of somewhat windy declamation, to awaken much interest in those who do not. Over-zealous advocacy spoils many a good cause. Magyar birth and education, followed by a long period passed under Turkish influences, are unlikely to conduce to a calmly critical frame of mind towards Russia, and the tone and language of these essays are hardly those of an impartial observer, claiming to be actuated by "perceptions resulting from long study and practical experience."

The Central Asian question, bound up as it is with the future of Turkey, is without doubt the most important problem out of England that, as far as we can see, English statesmen will have to solve during the present century; and the recent ostrich-like policy of persuading ourselves that there is no danger, simply because we do not choose to see any, cannot last much longer. Whether we like it or not, another twelvemonth can hardly pass without grave complications arising in the rapidly narrowing space between India and Asiatic Russia. The threatened Russian interference in Kashgár, staved off for the present by the submission of Yákúb Khán, and the whispered rebellion of his namesake of Herát, in consequence of the 'Amír's passing him over as heir to the throne of Kábul, a decision in which Russian influence may be not unreasonably suspected, are ominous clouds in the horizon. It appears from the St. Petersburg press that the Russian expedition to Marv, projected, no doubt, like its predecessors to Khaiva and elsewhere, simply to chastise evildoers, is postponed for the present in consequence of the refusal of Persia to join in it. If, as there seems every reason to expect, it is renewed next spring, with or without the co-operation of the Sháh, its issue will be a touchstone of Russia's real intentions in the East. Of course, there will be the usual disclaimer from Prince Gortschakoff, or possibly Count Schouvaloff may pay another visit to London; and of Russia's ability to root out the horde of Túrkmán manstealers whose headquarters are at Marv there can be no doubt, nor of the service that she will thereby render to humanity. The question is, Will she stay there? If she contents herself with punishing the Túrkmáns, and gives back Marv to Persia, its legitimate owner, the confidence of our statesmen in the good feeling of Russia will be justified. We may look on her as our commercial rival alone, and the very reasonable theory that her advances in Central Asia are due, like our own in India, less to lust for dominion than to inevitable destiny, will be fully upheld. But should she incorporate Marv with her own dominions, or, what amounts to the same thing, with Bokhára or Khaiva, the predictions of Mr. Vambéry and of other intelligent observers, English and

foreign, who are now stigmatised as Russophobists, will be on the high road to fulfilment.

Marv in the hands of Russia will be a pistol at the head of England. From a military point of view it will offer facilities for attempting or threatening an invasion of India which may be compared to those enjoyed by England against France whilst Calais remained in our hands. It will be the *tête de pont* across the river, behind which the bridge may be constructed in safety and secrecy. Politically, its occupation will give occasion for open meddling in Afghán affairs, and followed as it will necessarily be by the establishment of a chain of Russian forts along the road from the Caspian, will debar Persia from the power which she, and we through her, still possess of active interference on her as yet undefined north-eastern frontier.

Time, and not a very long time, will show which are right—the Russophobists or their antagonists. Whether the solution of the problem should be left entirely in the hands of Russia is another question, and one which we have no doubt is occupying the attention of our rulers.

An impartial history of Russian progress in the East, accompanied by a good map, and with references to official documents, would have been welcome to many in the present calm, which may or may not be the harbinger of tempest. Mr. Vambéry's book does not fulfil these conditions, full as it is of undoubted historical facts, and logical as are the conclusions which he draws from the Russophobic point of view. Nevertheless it is worthy of study by those who care to form an opinion for themselves on the question we have tried to set clearly before our readers.

On one point, the respective relations of Turkey and Persia to the Central Asian question, we are unable either to accept all Mr. Vambéry's facts, or to agree in his conclusions. He blames Persia for not taking part with Turkey in the Crimean war, and attributes her not doing so to Russian influence. We thought it a notorious fact that Persia was only prevented from joining in the crusade against Russia by the strongest remonstrances from England, unwilling to have another "sick man" on her hands. Again, so careful a student of ethnology might be expected to recognise that the antagonism between Turk and Persian, Súní and Shíah, is no new thing, referable to the modern representatives of the races, but prehistoric in its antiquity. Irán and Turán, Medes and Persians, Túrks and Tájiks, apart from any question of virtues and vices, have ever been, and ever will be, as impossible to amalgamate as oil and water. To characterise Persian kings as ambitious egotists because they deliberately brought about a schism between their subjects and the rest of Islám, is a strange heresy to Englishmen, proud of the refusal of their forefathers to submit to the religious supremacy of Italy. If Persians offended the Turkish minister at Tehrán by burning Omar in effigy, it does not seem a very serious crime in the eyes of a nation which has hardly left off doing the same by the Pope and Guy Fawkes every fifth of Novem-

ber. One opinion expressed by Mr. Vambéry in the paper referred to we can cordially endorse. The presence of French diplomatists in Tehrán, which might be useful to Persia and to English influence, is an unmitigated evil to both, without any but a negative advantage to Russia. As Mr. Vambéry says, the French minister "ought either to support Russia against Turkey and England, or both of them against Russia; he cannot carry on a purely French policy, and he has none moreover to carry on." The ostensible object of his presence is, we believe, to protect the Catholic Armenians. His occupation is to thwart with perfect impartiality every proposal made by England or Russia, for obvious reasons in the latter case, in the former from the petty spite and jealousy of which we had an exhibition during Sir Bartle Frere's expedition to Zanzibar.

The translation of Mr. Vambéry's papers is generally meritorious. Occasional sentences are somewhat prophetic in their obscurity, but, perhaps, this is the fault of the original. Partial attempts appear to have been made to render the Oriental names according to some English system of transliteration, but the majority remain in their naked German deformity. The result is even more appalling than usual. Is Mr. Vambéry, or his translator, responsible for *Beludjans*, *Shiites*, and *Tongens*?

O. ST. JOHN.

The Black Book of the Admiralty. Edited by Sir Travers Twiss. In Two Volumes. (Rolls Series.)

Second Notice.

SIR T. TWISS's second volume contains five pieces. Three are the customaries (*coutumiers*) of the boroughs of Ipswich, Oleron, and Royan at the mouth of the Gironde, and are valuable for the light they throw on the history of the English and French boroughs, and, in the cases of Ipswich and Oleron, on the growth of modern maritime law, both which subjects the editor discusses in his introduction. The others are two texts of peculiar interest, among the many varying ones which exist, of the Sea Laws of Oleron.

Ipswich is known to have enjoyed municipal institutions, the nature of which cannot be stated with much detail, from before the Norman conquest. In the year 1200, King John granted to it a charter, under which the governing body was to consist, "as far as the Crown was concerned, of two elective bailiffs, whose office it was to collect the custom of the borough, and to pay the fee-farm into the king's exchequer, and of four elective coroners, whose duty it was to keep the pleas of the Crown, and to see that the governors of the borough behaved justly and lawfully towards the poor as well as the rich." (Intr., p. xix.) According to the custom of that time (Intr. pp. xxix., xxxi.), the charter left the internal constitution of the borough, in all further points, to be freely self-organised, and so the common council of the town, having elected their bailiffs and coroners in pursuance of the charter, proceeded to ordain that there should be in the borough twelve capital portmen, and to

declare their duties, among which was to render the judgments of the town, and their remuneration, which consisted in the enjoyment of the Olderholm meadow for the support of their horses. These capital portmen, as soon as they were elected, "caused the whole of the townsfolk to stretch their hands towards the book, and with one voice solemnly to swear" obedience to their elected officers, and to maintain the town, its new charter and its liberties, against whomsoever, saving the king's just prerogative. "This," says Sir T. Twiss (Intr. p. xx), "is one of the instances of the remarkable system of adjustment between antagonistic principles which is the characteristic of English political institutions. We have here the substance of the 'sworn commune' of France, with its own elective magistrates administering justice on all questions of civil right between the burgesses themselves and between the burgesses and strangers within the borough, according to the free customs of the borough; on the other hand, in criminal matters, the king's law was affirmed, and special officers were elected by the burgesses themselves from amongst their own body to administer that law."

Another step which was most wisely taken by the burgesses immediately after the grant of the charter, was to put into writing the free customs according to which their magistrates were thus to administer justice; but "for as much as" (this first customary, described as) "the elde Domus Day, and the elde vsage of the toune of Gippywyche, and other rollys and remembraunces of the same town, by a fals common clerk of the forseide toune weryn borne away and falselich aloyned" (made away with, *éloignés*), after which the old customs were often designedly changed and violated, the town, in the 19th year of King Edward I., 1290-1, chose twenty-four men who were sworn to put the old customs again into writing. The result of their labours was the customary commencing "Ceo est le Domesday des Leys e des Usages de la ville de Gippewyz," which Sir T. Twiss has printed in the original French and in an ancient English translation, from two MSS. in the British Museum.

The customaries of the communes of Oleron and Royan are printed from one of the Douce MSS. in the Bodleian library, which gives its own date as having been completed on February 10, 1344. The customary of Oleron purports in its opening words to have been compiled by Guillaume Guischos, clerk of the commune, under the direction of the mayor and *prud'hommes*, and the editor is disposed, from internal evidence, to refer such compilation to a period shortly prior to the year 1314. Its full title, which should be given in order the better to distinguish it from the Sea Laws, is "Les bons Usages et les bonnes Costumes et les bons Jugemens de la Commune d'Oleron."

One of the most interesting features in the Ipswich *Domesday* or customary, and one which evidently had a principal share in attracting the learned editor's attention to it, is the existence of a court of maritime law sitting every tide, or perhaps at each time of spring tides; "the ples yoven (behooven—appertaining) to the lawe maryne, that is to wite, for straunge marynerys passaunt

and for him (them) that abydene not but her (their) tyde, shouldene ben pleted from tyde to tyde" (art. 1.). We thus have evidence that the maritime law was not first introduced into England through the Court of the Admiral, but was administered at least as early as the end of the twelfth century by the courts of the chief maritime boroughs, as a distinct and known body of law, but yet as forming part of their free customs, because it was the customary law of their own and the other mariners who resorted to them. On this Sir T. Twiss reminds us that under imperial Rome maritime causes were to be heard without any delay, and that the decisions of the consuls of the sea of the city of Trani, of the date 1063, to which M. Pardessus so happily called attention, and the Assises de Jerusalem, ranging from the commencement of the next century, give good reason to think that this beneficial provision of the Roman law was never allowed to lapse, but was carried into effect, throughout the dark ages, by special courts of the sea in the great Mediterranean ports; and we cannot refuse to follow him in the inference that similar courts existed in this country also, long before the charter of King John proved the occasion for putting the judicial system of Ipswich into writing. Indeed, there is some evidence that the Atlantic and German Oceans had gone on *pari passu* with the Mediterranean, in modifying the maritime laws contained in the *Digest*, in such a manner as presupposes the action of regular courts. Thus, while in the decisions of Trani "the slave no longer figures as a chattel, which may be thrown overboard to lighten the ship: the crew are free men," and rules are laid down as to their rights and duties,—also it is laid down, contrary to the *Digest*, that where a ship is not totally lost but only damaged, her owner may call on the owners of the cargo to contribute to her repairs,—the compilation published after the Conquest as the laws of Edward the Confessor contains, no less, a rule on maritime jetison differing from the Roman.

The customary of Oleron shows that the jurisdiction under the maritime law was exercised, at its date, by the Mayor's Court of that commune. But the question remains whether the famous Sea Laws of Oleron, or "judgments of the sea," which we have already seen entering into part C of the Black Book of the Admiralty, were judgments of that court. They are certainly older than the customary, yet some of them may have been later than the establishment of a commune at Oleron, and therefore have been given by its mayor; and, as Sir T. Twiss remarks, they were so regarded by the transcriber of one MS. of them, of which the title describes them as the *Jugemens du Mair*, and which belongs to the fourteenth century. Yet it can scarcely be doubted that many of those judgments must have been rendered by ancient courts of *prud'hommes* of the sea, at least by those who regard them as emanating from courts at all; and we imagine that after the editor's exhaustive discussion, few will take any other view. Before M. Pardessus, three theories about them were current among authors of repute, all supposing that they were compiled and issued by the order of

some potentate, but respectively making that potentate to be Eleanor, Duchess of Aquitaine, her son Richard I. of England, and Otho, Duke of Saxony, Governor of Aquitaine during the reign of Richard I. M. Pardessus, on the contrary, seeing the objections to all these theories, and the wide diffusion of the judgments, concluded that the latter in no way belonged to Oleron, but were the common maritime law of a large part of Europe; he did not, however, explain how the floating law came to assume this particular form, or how the judgments came to be connected with Oleron by name, in every ancient MS. of them, and in every ancient public document which alludes to them. To all the three theories which, while connecting the judgments with Oleron, attributes their compilation to some national authority, besides the special objections to each, there lies the general objection that the age for such dealings with local customs did not arrive till long afterwards. The old customaries, whether they set forth the system of judicature of a particular place, or the judicial procedure to be observed or the law to be administered in a particular court, emanated from the authorities of that place or the officials of that court. Such were the *Doomsdays* of Ipswich and the other English boroughs, and the old French *coutumiers*, before the pens of scientific jurists, and revision by royal authority, in the sixteenth and following centuries, had reduced them to the form in which we now read them: of these old French *coutumiers* so few have been printed that those of Oleron and Royan, in the volume we are reviewing, are important additions to the number. So too "*Les Costumes d'Oleron et deu Jutgamen de la Mar*," "*Le Jugement de la Mer et Koolle d'Olayron*," or by whatever equivalent name the compilation is described, must have been prepared in and for the use of some court, of *prud'hommes* of the sea or of a mayor, in the town of Oleron: several of the copies purport to have had "the seal of the island of Oleron, established for contracts," appended in testimony of their having been taken from the original roll and the form of each article, stating a case, with the decision, and concluding with the words, "This is the judgment in such case," speaks of the connection with an actual court. The celebrity of that court, combined with the fact that the custom of the sea which it administered was common to a great extent of coast, sufficiently accounts for the widespread authority of the roll which was elaborated and preserved in its registry.

The *Consulate of the Sea*, so far as it can claim to have been a widely accepted body of maritime law, consists of the second treatise, on the Good Constitutions and Customs of the Sea, and the third treatise, on Cruisers of War, in the first part of the *Book of the Consulate*, which was printed at Barcelona in the Catalan language in 1494, having been "drawn up for the use of the consuls of the sea at Barcelona by the notary or scribe of the Consular Court, just as the Black Book of the Admiralty was drawn up for the use of the judge of the High Court of Admiralty in England by the registrar of the Admiralty Court" (Intr., p. lx.). These treatises Sir T. Twiss considers to belong

to the second stage of the history of modern maritime law, the stage analogous to that of the scientific and revised *coutumiers* of the French districts, and not to the same early stage as the decisions of Trani and the judgments of Oleron (Intr., p. xlv.). From internal evidence, he declines to date them earlier than the middle of the 14th century, and at any rate the notion of their high antiquity in their present form has for some time past been exploded.

We have dwelt at such length on Sir T. Twiss's researches into the growth of modern maritime law, that we must pass lightly over the other matters of interest which he points out as resulting from the customaries printed in his second volume. He considers that the Ipswich *Domesday* "supplies most valuable evidence on several matters respecting the jury, which are at present involved in great obscurity," and "adds to our knowledge on the subject of compurgators;" and he sums various details by saying that "it would appear from the *Domesday* of Ipswich, as compared with the customary of Oleron, that the condition of the English burgess was, in the time of Edward I., in respect of personal independence and legal capacity, in advance of the condition of a burgher in the duchy of Aquitaine" (Intr., pp. lxx., lxxiii., lxxv.). A very curious punishment of Jews at Oleron is mentioned in the Introduction, p. xxxiv.

We must also refer to the work itself for a valuable distinction which Sir T. Twiss has drawn between the Gascon and the Norman or Breton MSS. of the Rolls of Oleron, the English MSS. agreeing with the former (Intr. to vol. i., p. lxxiii. *et seq.*; Intr. to vol. ii., p. lxxviii. *et seq.*). Of the two texts of the Rolls printed in his second volume, one is a previously unpublished Gascon text, in the earlier form, which has only twenty-four articles, while the other is a reprint of the longer text, with forty-seven articles, and apparently derived from a Breton source, contained in the now rare first edition of Garcie's *Grand Routier de la Mer*, of which the introductory epistle is dated in 1483.

J. WESTLAKE.

The Norman People and their existing Descendants in the British Dominions and the United States of America. (London: Henry S. King & Co., 1874.)

THE aim of this work is "to show that the Norman settlement at the Conquest consisted of something more than a slight infusion of a foreign element—that it involved the addition of a numerous and mighty people, equalling probably a moiety of the conquered population—that the people thus introduced has continued to exist without merger or absorption in any other race—that as a race it is as distinguishable now as it was a thousand years since," and so on. These theories are grounded mainly upon the evidence of supposed Norman names to be found in the *London Directory*, a formidable list of which forms the great bulk of the volume. In the introductory chapters the anonymous author explains the successive steps by which, having first traced his own descent from the "imperial race," he was led to ascribe the same origin to 400 out

of 550 peers, the great majority of the landed gentry and "the intellectual aristocracy," and finally to a third or more of the entire population of the country. The superiority of Norman blood, we are told, everywhere asserts itself. Enquiry into the descent of "the great captains, statesmen, poets, philosophers, jurists," and others, whose names are famous in English history, gave the following result. "The Anglo-Saxon and the Dane were in a hopeless minority; they were considerably outnumbered by the Celt. The Normans far exceeded in number the whole of the other races put together." These confident assertions are unaccompanied by any detailed proofs; and the strange reason is given for the omission, that the amount of evidence is so great that it would but embarrass the argument to produce it. Instead, therefore, the reader is referred to the alphabetical series of Norman names; and, to do the author justice, he does show there plainly enough what kind of evidence he considers sufficient to prove "an undoubted Norman origin." The majority of these names are identified as Norman by their occurrence, or that of their French or Latin equivalents, in Norman records of the eleventh and twelfth centuries. The fallacy of such a test, as might be expected, is apparent on almost every page. Thus Brock, Brook, Broke, Brooks, &c., are all said to be Norman names, and derived "from Broc, Anjou." But in the first place Anjou is not Normandy; and, moreover, the obvious derivation of all the above names is from the simple English "brook," which appears in ancient deeds and other documents in all the earlier stages of a residential surname, such as "atte Broke," de la Broke, "apud Brocam," &c. Again, the Norman origin of families bearing the name of Oake is inferred from the occurrence in Norman records of "de Quercu," Meadows from "de Pratis," Bury from Bourri, near Gisors [why not from Bury in England?], Ireland from "de Hibernia;" and so with London, Lincoln, and like names. Even "English" is not English but Norman. Granting even that the "Anglicus" of the Norman Exchequer Rolls is a regular surname, and not, as is probable, merely descriptive, as so-and-so "the Englishman," how does the author suppose it to have originated if not from the family being of English descent? If it is necessary to account for the name in England, it is easy to believe that two near neighbours of different race and the same baptismal name might be distinguished as "John English," and "John Norman," and the surname thus formed would soon become hereditary. The large class of names derived from trades, &c., such as Carter, Carpenter, Goldsmith, even Smith itself, are claimed as Norman with equal confidence, though in some cases it is conceded that some English families may be included. We pass over these, however, in order to give an example or two of the author's method of proving that genius in an Englishman argues a Norman pedigree. Sir Isaac Newton, it is urged, was of the Norman family of Pesson, because one William Pesson and his descendants held land at Newton, co. Lincoln, and took thence the name "de Newton." But even if the philosopher got his name from the

particular Newton in question, it does not follow that he was a Pesson; for mere residence in a village, or on a manor, gave rise to a local surname quite as often as ownership, and for one family of Newtons of the latter class there may well be half-a-dozen of the former. Shakespeare in like manner is made to descend from the Norman family of De Perers. A branch of this house held land at Saxby—or, as it was sometimes written, Shakesby—in Leicestershire; and the author holds that both the English Shakespeare and the Norman Sacespee are corruptions of the local name thus acquired. In confirmation, he appeals to the similarity of the arms of Shakespeare and Perers. In so doing, however, he not only assumes that the poet's father had a real ancestral claim to the arms granted him by Dethick in 1599, but wrongly describes the coat itself, the field of which is not *argent*, as he says, but *or*, and the sole resemblance to the arms of Perers is that both coats have a bend sable. The argument, therefore, from the armorial, so far from supporting the author's theory, makes decidedly against it.

To conclude, the author cannot in any way be congratulated upon the success of his work. Some of his arguments are ingenious, but very few are convincing; and the naive simplicity which they often display will make a cautious reader hesitate before accepting upon trust the correctness of his many unsupported assertions. G. F. WARNER.

Two Little Wooden Shoes. A Sketch. By Ouida. (London: Chapman & Hall, 1874.)

Mr. Carington. A Tale of Love and Conspiracy. By Robert Turner Cotton. Second Edition. 3 vols. (London: H. S. King & Co., 1874.)

Transmigration. By Mortimer Collins. (London: Hurst & Blackett.)

A Chronicle of the Fermors: Horace Walpole in Love. By M. F. Mahony (Matthew Stradling.) 2 vols. (London: Sampson Low.)

It is not easy at first sight to say why it should be considered a reproach to call a novelist sentimental, and a compliment rather than otherwise to call him (or her) impassioned. Novels are supposed to be chiefly valuable as representations of different varieties of human nature, and sentiment is as real an element in human nature as passion, and perhaps a rather more common one, so that it might seem to have at least an equal right to representation. The source of the prejudice is to be found, probably, in a vague but not quite baseless belief that sentiment is more likely in proportion than passion to find an unreal or false expression. The representation of passion is subject to control or verification by the necessity of giving a credible account both of the person by whom the passion is felt, and of the object by which it is inspired; for it is only when both these are made clearly conceivable that the relation between them, or the passion itself, appears real and natural to the spectator. If the circumstances described are those which in real life would stir deep emotions, to which the characters in the romance appear insensible, the work is commonly sensational; if, on the other

hand, the writer succeeds in representing men and women in considerable agitation of mind, without provocation, or upon provocation which would naturally induce a different kind of agitation from that exhibited, the work may be called sentimental, as fairly as if it had been deliberately intended for a representation of sentiment, which is simply passion unattached, a disposition to feel strongly about something or other, with a degree of obtuseness as to the comparative claims, of the different things about which human beings are supposed to be capable of feeling, to excite the sentiment which the author chances to be able most easily to reproduce.

In *Two Little Wooden Shoes*, Ouida, as usual, does not get beyond a kind of sentimentalism, which is, however, sufficiently effective to make it worth while to ask why, on reflection, the effect is always felt to be tricky and unsatisfactory. The reason, we imagine, is, that the author aims directly at exciting in her readers the sentiment which she conceives to be appropriate to the situation (always the same) which she prefers to treat, instead of representing the situation itself with such commanding truth and power as to ensure a response of some kind, even in readers who may take a different view of the situation from herself. The consequence is that the situation is never realised at all, even by the author, and that which is realised by her, and more or less effectively communicated to a congenial reader, is a sentiment, wandering at large amongst impossible occasions, and therefore never more than half true to life and nature. In the present instance, the sentiment to be communicated is one of languidly reproachful acquiescence in the order of nature, which causes a dreamy little flower-girl to come to an untimely end, like one of her own rosebuds; or, as the author puts it, having confidence enough in the theory to lay it down with epigrammatic generality: "Men are true children and women are their rosebuds."

Now Ouida, notwithstanding a genuine fondness for children, which is one of the pleasantest traits in her writings, has never made the discovery that a healthy child is the most unsentimental of beings, exactly because all its experiences are concrete and particular; and if she had further been able to believe that, in this respect, the child is generally father to the man, her heroes would have less of the appearance of being created *a priori*, as the purely ideal correlatives of a natural disposition on the part of flower-girls and novelists to be very much impressed by what they do not understand. Lady novelists especially are apt to imagine that they are realists as soon as they have summoned up courage to disregard—or, better still, to invert—the old-fashioned rules of poetic justice; but it is evident that something more is needed to complete the portrait of a sinner than an assurance, on the last page, of his impenitence and impunity—though this may be true and plausible enough as far as it goes. Ouida, however, never knows anything more of her heroes than that they are very wicked, very clever, very handsome, and cause a great many flower-girls and others to drown themselves for

love of those superlative qualities; but the latter part of the process which the novelist describes is not reckoned amongst the evidence of the hero's diabolical fascination and craft, because the sentiment of fatal awe and admiration which attends his steps presupposes a magic in his presence quite apart from anything he can be made to do or say on the stage. In one way the present volume gains in veracity by its slightness, because Flamen (a luxurious artist who wishes to paint a Gretchen), is not in evidence long enough to display qualities actively incompatible with the sentiment of which he is the shadowy object; but then, as his loyal worshipper, Bébée—who wears her little wooden shoes into holes by walking from Brussels to Paris when she hears he is ill—is something of a genius as well as a good and industrious little girl, it is hardly fair to suppose her to be fascinated by a lay figure without any individuality at all. The scenes descriptive of the quaint fancies and lonely business-like life of the pretty young orphan amongst friendly villagers before Flamen lends her *Paul and Virginia*, are pleasantly drawn, but as we advance the style becomes sentimental in the same vicious sense as the matter, and meaningless refrains with a pathetic sound are used at intervals as a kind of warning that these are the places where it is desirable to feel as tearful as possible. A good deal of sound virtuous indignation has been expended, we cannot but think unnecessarily, in denouncing the moral tendency of the fictions of this author and her school. An admiring critic in the *Revue des Deux Mondes*, who gives Ouida credit for a daring imagination rare in this country, quotes her as silencing prudish objections by the assurance "Je n'écris pas pour les femmes, j'écris pour les militaires;" in which we should be tempted to see a piece of profound cynical self-criticism if the slightest touch of humour in her works would allow us to suppose that she is herself not altogether imposed upon by the heroes who are probably admired by no living men, except perhaps very young officers in regiments of higher social than literary repute. However this may be, the *Little Wooden Shoes* will certainly not do any harm to any one who does not make the mistake of thinking the writing really fine; whilst anyone who is capable of making such a mistake deliberately, must have a mind too impervious to literary influences to be in much danger of suffering moral deterioration from anything in print.

Mr. Robert Turner Cotton's ideal of masculine perfection has much in common with that of Ouida, but, perhaps out of regard to the degeneracy of the age, he displays it less crudely and, as it were, symbolically. He has a generation of young men who are comparatively possible and prosaic; but they have a few surviving ancestors who in their youth fought duels, drank, gambled, and made love on an heroic scale, while, towering above the heads of even these distinguished persons, there appears the real hero, Mr. Carington, who arranged for them whom they should shoot, marry, disinherit, or otherwise provide for, while he was himself too distinguished even to condescend to take

part in those aristocratic diversions which he superintends in a grandly providential manner. We are told that Mr. Carington, when he could not find a good novel to read, used to send to the circulating library for the silliest of the season, and generally derived amusement from it. Perhaps Mr. Cotton was not uninfluenced by this peculiarity of his hero in writing what is more like a burlesque upon ordinary novels than a serious attempt to achieve something more imaginative than even Mr. Mortimer Collins's *Transmigration*. It is true that both these works are supposed to have really but one author under different names, the chief reason being that in both all the characters have a habit of eating lobsters with enthusiasm at all hours of the day or night, and that in both the poetical mottoes which abound are taken from "The Comedy of Dreams," which we gather to be an unpublished trilogy in which things earthly and celestial do their best to look as if they were standing on their heads, but have some difficulty in keeping in recognisable shape, because they are released from obedience to the laws of gravitation as well as from the minor canons of probability. We believe there are some people besides Mr. Carington who do find novels amusing in which a great many things happen for no reason in particular, and every one talks animatedly and with an air of deep conviction about nothing; who prefer, in fact, a magic lantern to dissolving views, and both to a panorama. Mr. Carington may be read without the sustained mental effort requisite to follow, for instance, a cunningly devised plot of Mr. Wilkie Collins, and yet it contains, if possible, more of marvel and mystery in the same space, because none is wasted upon explanatory details or futile attempts to fill in the missing links of causation. There is a Russian Prince, who is so very wicked that nobody but Mr. Carington can keep him in order; and there is a Russian secret society, of which the late Emperor Napoleon III. was the head—it is impossible to guess why, as the final cause of the society seemed to be a desire to do something rather dreadful (as soon as it could settle what) to the Russian Prince. The Foreign Office of course knows nothing about all these transactions till they are explained to a discreet subordinate by Mr. Carington, who, we are given to understand, puts an extinguisher on the society by carrying off into Cumberland, and marrying to a friend's son, the Italian lady who acts as the Emperor's second and aide-de-camp. It does not appear that the "love and conspiracy" have any thing more to do with each other than is implied in the business of both being looked after at the same time by Mr. Carington. If we had to choose, we should, on the whole, give the preference to the conspiracy half of the production, for Mr. Cotton's ladies are nearly as bad as Ouida's men, though, to do him justice, he is content with traducing their manners, and introduces no immorality to speak of that is less than fifty years old. One young lady who, we are told, is a comical imitation of a stage chambermaid, answers sufficiently well to the description; but the real heroine, Elinor, for whom the author professes unbounded reverence and admiration, does not succeed

in so demeaning herself as to make his boisterous assurances that she is the perfection of noble grace and gentle breeding appear as impertinent as such express statements would do if made concerning "the absolute perfection of womanhood." To say that the ideal lady is perfect, shows a want of faith in the self-evidence of her perfections, but to praise her in so many words for being ladylike is a positive insult, or a confession of innate vulgarity; for it is not more marvellous for the ideal to be innocent of pertness (which, by the way, she is not) than of pocket-picking.

The hero of *Transmigration* has three lives, one to each volume, of which the first and third are spent on earth, and the second in the planet Mars, the general result of which seems to be that, wherever lobsters and pert nymphs of erratic habits may be found, man may enjoy moments of contentment; but that for solid, durable happiness, it is necessary to be a school-boy, subject to flogging. The book is not amusing, because the author tries to play with his fancies before they are full grown, and seems not to be quite sure but what, if they were allowed to grow, they might develop into a serious contribution to philosophy. Still, the second volume is the least tiresome of the three, though we cannot commend the modesty of this new Dante who summons the great *Estese* from the shades to act as his guide, philosopher, and friendly co-devourer of lobsters; the change of planet, however, seems to have moderated the length as well as the depth of the Coleridgean harangues.

The *Chronicle of the Fermors* is a chapter of domestic romance from the last century, with the scenery carefully got up from contemporary memoirs and correspondence; but the only justification for the second part of the title (*Horace Walpole in Love*) seems to be the assumption that Horace's way of being in love would be to give no signs of the fact until the lady appeared to favour some other suitor, in which case he would begin to satirise her mother. There are no means of disproving the first part of the hypothesis; but the second seems to prove too much, for Horace Walpole can scarcely have been in love with the daughters of all the ladies of whom he has something spiteful to say in his correspondence. The author scarcely succeeds in showing that he took more interest in Lady Sophia Fermor than in any other famous beauty, who was expected to marry one Lord (Lord Lincoln) for love, and was consoled for her disappointment by the elderly, but illustrious Premier, Lord Carteret. There is an anachronism in some of the political wisdom which the Duke of Newcastle is supposed to bestow on his nephew Lincoln, who is to be consoled for the loss of Sophia by the prospect of the government of Ireland, which has the advantage, observes his Grace, of requiring neither skill nor knowledge. It may be doubted whether the idea that skill or knowledge might be expected by a troublesome population from their rulers had so far taken shape in the ducal mind of the period as to be worth noticing even as a fallacy.

EDITH SIMCOX.

NOTES AND NEWS.

WE learn that Sir T. Duffus Hardy has a rod in pickle for his opponents as to the date of the Utrecht Psalter.

THE two volumes of Peter Buchan's collection of Ballads in the British Museum have been copied for the Harvard College Library, in Cambridge, United States, by direction of Professor F. J. Child.

MR. SELBY has nearly ready for the Chaucer Society his account of the robberies of the poet Chaucer, in September, 1390, and of the fate of the gang of highwaymen who robbed him.

DR. JAMES A. H. MURRAY has undertaken to re-edit, for the Early English Text Society, the romance of *Sir Tristram*, from the unique copy in the Auchinleck MS., of the early part of the fourteenth century; and it is probable that M. Paulin Paris's essay on the sources of the French romance of *Tristan* will form part of Dr. Murray's volume.

WE are glad to find that Dr. Schmidt's *Shakspeare Lexicon*, which we noticed last week, is finished to the letter L, and that the first volume, containing A—L, will be published shortly by Messrs. Williams & Norgate. Dr. Schmidt's present title for his Lexicon is *The English of Shakspeare*; but as this is already the title of the late Professor Craik's well-known book on the play of *Julius Caesar*, issued in 1857 by Messrs. Chapman & Hall, we hope the Königsberg doctor's title for his new book may be changed.

AMONG the forthcoming books about Central Asia three are certain to have special importance. Mr. Schuyler is about, it is said, to resign his appointments as Consul at Riga and Acting Secretary to the U. S. Legation at St. Petersburg, in order to be able to write with more freedom about the proceedings of the Russian troops, but his book is not likely to appear till the autumn. Mr. Ashton Dilke will shortly publish the account of his successful march (stolen upon General Kaufmann) from Semipalatinsk in Siberia to Tashkent and Samarcand, and all he saw by the way and heard in various parts of the Russian empire. And Mr. Mac Gahan, who fairly astonished the Russian commanders of the Khiva expedition by the cheerful audacity with which he braved the perils of the desert in order to come up with the advancing Russian columns, will soon give us a description of his march with them to Khiva, and of the fall of that city. A part of his book will be devoted to his adventures among the Kirghiz of the Koom-Kizil, to talk of civilising whom he thinks is absurd, deeming it more reasonable to expect that they will civilise us.

A good sign of the progress of Oriental Numismatics in England is the production by Mr. Stanley Lane Poole of a catalogue of the first portion of Colonel Seton Guthrie's splendid cabinet. The work, which is now in Messrs. Austin's press, will be illustrated by a large number of excellent plates by the Autotype Company.

THE rejection of Sir John Lubbock's Bill to provide for the better preservation of our ancient national monuments, gives a foretaste of what literature and science have to expect from the Legislature. Sir John Lubbock's bill was the last bid for the few remaining Sibylline leaves which might, which ought to have been saved. But with the fact staring us in the face, that every year the most valuable ancient monuments are being destroyed and carted away, it has been decided that to try to save national property is not much better than "burglary by daylight," and that the country must trust in this matter to the enlightened spirit of country gentlemen and farmers. When Charles II., in 1663, visited the Celtic remains of Abury, sixty-three stones were standing within the entrenched enclosure. Not quite a hundred years later they had dwindled down to forty-four. Dr. Stukeley saw the upper stone of

the great cromlech there broken and carried away in twenty cartloads. After another century, seventeen stones only remained within the great enclosure, and these are now to be left to the tender care of gentleman-farmers, who consider as rubbish whatever is not in its right place. And this is a monument, as Sir John Lubbock said, "than which there is none more remarkable of its kind in Europe."

MR. BERESFORD HOPE, no advocate of spoliation, we should think, appealed to the House "not to let it go forth to the educated world that, notwithstanding the exuberance of our wealth, we were the only people in Europe who were careless of that great inheritance—the historical monuments which had come down from our predecessors," but the Chancellor of the Exchequer was proof against such Batavian arguments. Not many years ago the *Quarterly Review* (1867) adduced those very arguments in favour of the preservation of the national monuments of England and Ireland which, when last week addressed by Sir John Lubbock to the House, were treated with undisguised contempt. These are the closing words of the article: "*Such things ought not to be. Let those whom it concerns look to it before it is too late. These Celtic monuments are public property as much as London Stone, the Coronation Stone, or Westminster Abbey, and posterity will hold the present generation responsible for the safe keeping of the national heirlooms of England.*"

THE same question has recently assumed an alarming aspect in Italy, where so many of the great monumental works on which the nation prides itself really belong to private individuals. At the present time, Giotto's celebrated frescoes in the Scrovegni Chapel at Padua are the subject of litigation between a private family and the chapter of the Church of the Arena at Padua. These frescoes were painted by Giotto for Enrico Scrovegni, a noble citizen of Padua, who in 1303 built the chapel now called by his name, and employed "the acknowledged master of painting in Italy" to decorate it with paintings. The present family of Grademo, the inheritors of the old Scrovegni family, accordingly lay claim to these works as being their own private property, and have asserted their claims in the most aggressive form, namely, by making a contract for their sale and removal. The chapter deny the right of the family thus to alienate a great national monument of art, and the question is now to be adjudged by law. The most distinguished and able counsel are, it is said, engaged on both sides. The decision is of the highest importance with regard to the national art of Italy. It is terrible to think of the impoverished or grasping descendants of the grand old families of Italy being able to annul their ancestors' pious munificence by putting up to auction the votive offerings of their family. It is said that, if the sale of the Paduan frescoes can be accomplished, England will be the gainer of them; but it must be remembered that, however glorious the possession of these greatest works of Giotto's art might be, they would inevitably lose in their removal all the charm of association. "It is not difficult," says Lord Lindsay, in speaking of the Scrovegni Chapel, "gazing on these silent but eloquent walls, to re-people them with the group once, as we know, five hundred years ago, assembled within them: Giotto intent upon his work, his wife Ciuta admiring his progress; and Dante, with abstracted eye, alternately conversing with his friend and watching the gambols of the children playing on the grass before the door." Even Lord Lindsay's imagination would find it difficult to conjure up this vision in a London gallery! Besides, there is the great risk to be considered that must attend their removal, however skilfully accomplished. Altogether, therefore, it is to be hoped that the present representative of the Scrovegni family will be foiled in the attempt to turn the inheritance of every lover of art to his own particular benefit. Does he not remember that the avarice of one of his ancestors

immortalised him in the seventh circle of the *Inferno*?

Messrs. MACMILLAN will publish a translation of Lessing's famous piece *Laocoon*, with preface and notes by Sir Robert Phillimore. The translator's preface will describe the influence which the main position of the piece in regard to the *limits* of poetry and painting has exercised on subsequent work and thought in the two lines, and its struggle with the contrary maxim professed by Winckelmann, that each art could accomplish the work of the other. Many readers to whom the work itself is not otherwise familiar, may, perhaps, remember Mr. Matthew Arnold's poem, "Epilogue to Lessing's *Laocoon*." An endeavour will be made to render this edition popular by translations of the extracts from Greek and Latin writers that occur throughout, and by notes explanatory of the technical terms of aesthetic criticism that are employed by Lessing.

IN June, the monument of Hans Sachs, the once celebrated, but subsequently much-forgotten or abused head of the Master-singers, will be unveiled at Nuremberg. A complete edition of his works has also been commenced in serials by the *Literarische Verein* at Stuttgart. A course of three lectures will be given here, on "Hans Sachs and the Master-singer Period," by Herr Karl Blind, with a view of contributing to the costs of the Nuremberg memorial—which amount to 20,000 florins—and are not yet fully covered. The lectures will take place on May 22, 29 and June 5, at the Cavendish Rooms, Mortimer Street, Regent Street, at eight P.M.

THE Thessalian monasteries are threatened with something in the shape of a Universities Commission. The *Volo* correspondent of the *Levant Herald* states that the Patriarch has just sent a letter to the Greek bishop of Larissa, requesting him to send trustworthy persons to the monasteries in his diocese to investigate and report on their incomes and expenditure, to the end that a fair adjustment may be made, and the surplus devoted to establishing schools. Some of these monasteries are very rich, and it is hoped that a considerable sum will be realised by this very necessary reform, and made available for practical purposes.

We trust that the authorities of the monasteries may see the matter from the same point of view, and that the Commissioners may dispense with those *questiones infinitae ac subtilissimae* which seem to have so vexed the soul of the late Senior Proctor at Oxford.

THE lives and fortunes of correctors for the press do not fill up much space in the world's biography, but it is not uninteresting to a gleaner on the by-paths of historic lore to find traces of the existence of such useful members of the community upwards of two centuries ago. The career of the humblest individual, if plainly and truthfully narrated, is full of instruction. With the full conviction of this, and with a well-grounded belief that the subject of our remarks will be overlooked when that valuable work of reference, the *Athenae Cantabrigienses*, is sufficiently advanced to include the period in which he lived, we do not hesitate to publish the following little scrap of autobiography. When Thomas Phillpott, of Snowhill, in the parish of St. Sepulchre, London, was examined on December 30, 1660, about the publication of some seditious pamphlets, he said (we are quoting from a contemporary manuscript):—

"That he was sometimes a scholler att Christs Church neer St Barthol. Hospital London, and after a Kings Scholler att Westminster, and from thence chosen to Cambridge to Trinity Colledge, where he stayed about eight years: and tooke the degree of M^r of Arts; And about the yeare 1641 he taught schoole att Sutton Vallance, in the county of Kent, and continued neer 4 yeares. And before he was a corrector of a prying press of M^r Haviland, And since of several prying presses viz^t of M^r Griffin in the old Bayly, And of Richard Bishopp neer Bennets Castle

in Thamestreete, and alsoe of the widdowe Raworth neer to the same place. And the said examine doth now correct att M^r Whytes in Warwick lane and att M^r Mottershatt neer Docto^r Commons their presses, &c."

It would seem that the orders issued by the Japanese Government for the return of all students, except the few who are intended for the army and navy, are peremptory, and must be obeyed within two months of their receipt. The number of these Government students now in Europe and America is about five hundred and fifty, and they are chiefly engaged in qualifying themselves as civil engineers, and in studying commerce, banking, law, medicine and agriculture; about thirty-six only are studying the military and naval arts in various European countries. We understand that these young Japanese have been recalled mainly on economical grounds, as the cost of their maintenance, &c., is a heavy charge on the resources of their Government.

We had recently an opportunity of turning over a volume marked "Players Booke," preserved among the Lord Chamberlain's Records of the reign of Charles II. It contains copies of orders, &c., issued for the regulation of his Majesty's servants, which throw new light on the history of the revival of the drama. A few extracts are well worth reproduction here.

On December 7, 1663, the King, "being informed that divers persons do rudely press and with evil language and blows force their ways into the two theatres at the times of their public Representations and Acting, without paying the prices established, to the great disturbance of our Servants," &c., orders that no person of what quality soever shall offend again in this respect, "notwithstanding their pretended privilege by custom of forcing their entrance at the fourth or fifth Acts without Payment."

On April 6, 1672, his Majesty signifies his pleasure that Mr. Mohun, Mr. Hart, and Mr. Kynnaston, be continually furnished at the charge of the Master and Company of his Majesty's Comedians, each of them with the following habits:—

"Two Perruques to begin with for the first year
One Perruque yearly afterwards—to begin a year hence
Two Cravats yearly
One Lace or point Band in two years, the first band to be now provided
Three pairs of silk stockings yearly
Four pairs of shoes yearly
Three Hats yearly
Two plumes of Feathers yearly
Three shirts with cuffs to them yearly
and that this shall not be a precedent for any other to have the same."

Another order, of May 16, 1674, forbids any actor in his Majesty's Theatre or in his Royal Highness's Theatre to leave without giving three months' warning; and one dated January 18, 1678-7, directs that no person, not being a comedian, presume to come between the scenes, or to sit upon the stage or stand there during the time of acting.

Our last selection will be best understood by being given in its entire form:—

"No Act^r or Actress to go out of ye House in their acting clothes } Whereas Michael Mohun, Nicholas Burt, and Robert Shatterell three of His Ma^{ties} Comedians have given Bond of five hundred pounds unto Charles Killegrew Esq., Master of His Ma^{ties} Comedians to returne the Stock of Clothes and Scenes belonging to the Royall Theatre entire at the end of three yeares unto the said Charles Killegrew Esq. and whereas I am informed that some of the said Clothes hath been carried out of the House, and embzelled by some of the Company, These are therefore to require all His Ma^{ties} Company of Comedians both men and women that none of them presume to go out of the House in their acting Clothes, nor carry any of the said Clothes out of the House upon any pretence whatsoever as they will answer the contrary at their perills. Given under my hand and Seale

this 10th day of Aprill 1678. In the Thirtieth yeare of His Ma^{ties} Reigne.

"AZELINGTON.

"To His Ma^{ties} Comedians at the Royall Theatre."

Some of the best actors of this time had taken parts in much more serious engagements than were now allotted to them. Of those mentioned in these extracts, Charles Hart was a lieutenant of horse in the Royalist army, and Shatterell is said to have been in the same troop with him; Mohun served as major of a regiment in Flanders.

OCTAVE FEUILLET, the author of *Le Sphinx*, the *De Musset* of families and boarding schools, appears to have exercised a certain direct political influence over the government of the Empire which is not frequently vouchsafed to the purest and tamest of domestic novelists. His intimacy with Napoleon III. is a curious feature in his career. The Emperor preferred the dreamy mysticism of *Sibylle* and the *Jeune Homme Pauvre* to Mérimée's causticity and Houssaye's prettiness. The Librarian of the Palace of Fontainebleau was not unfrequently the only guest at those evening expeditions in the forest where the vague German sentimentality of Napoleon's character broke forth in quotations from Schiller and addresses to the setting sun. The Emperor would take the reins, and with the Empress beside him, and M. Feuilleux seated at the back of the *char-à-banc*, drive from Fontainebleau through the forest to one of the outlying villages. The novelist was accustomed to recite Victor Hugo's poems, the Emperor and Empress listening patiently; but it is presumable that Napoleon preferred Schiller, for his criticism on the *Légende des Siècles* is said to have been: "Grandes phrases; petites idées." It may be remembered that at the fall of the Empire, in spite of M. Thiers' sincere solicitations, Octave Feuilleux resolutely refused to retain his post of librarian at Fontainebleau.

THE publication of Gustave Flaubert's unsuccessful piece, *Le Candidat* (Paris: Charpentier et Cie.), lets some light into the mysterious laboratories where the censorship transforms moral poison into wholesome food. M. Flaubert has printed without comment the official corrections made in his manuscript. They are sufficiently eloquent. The author had likened one of his characters to a Seminarist; the Censure substituted "cagot." It preferred "entregent" to "intrigue" in a passage relating to the means to be employed at an election; struck out the words "Bishop" and "Monseigneur." There was in the text, "A ministerial committee proposes me;" the word "ministerial" was prohibited. The phrase "We will make him pass for a Legitimist in disguise" met with the same fate. And there are corrections less explicable than these. The heroine describes a suitor as "a man one wouldn't hire as footman;" her father remarks that he has been educated by an "eminent ecclesiastic;" his daughter retorts that her future sisters-in-law "ne savent pas l'orthographe;" and the red ink of the Censure erased these sentences as immoral and subversive of social order. These are all the changes made in M. Flaubert's original work, and it should be remembered that the piece was detained more than a month by the Censure, grave doubts being raised as to whether its production could be authorised at all.

M. SOULICE has just discovered and reprinted at Pau, *L'Apocalypse ou Révélation de Saint Jean mise en vers françois, avec les deux premiers Psalmes de David, l'Oraison Dominicale en langue d'Albigez et autres belles choses par Augier Gaillard Rodiez de Robastens en Albigez. A Tule, par Arnaud de Bernard, 1589*. This work of a poet who has been much discussed of late will greatly interest the curious. It contains, *inter alia*, a complimentary ode addressed to the author by D. de Mallortye, an epistle dedicatory of Augier Gaillard to the King of Navarre, in which

he speaks of Du Bartas, Ronsard, Du Plessis-Mornay, Henry IV., and the *Rodier de Rabastens*.

A CURIOUS duel has been going on between Meyer's *Konversations-Lexikon* (published at Hildburghausen) and Pierer's *Konversations-Lexikon*, sixth edition (Spaarmann, Oberhausen). Spaarmann brought out his first volume in great haste, so as to anticipate Meyer, but the critics found it so little satisfactory that he has withdrawn it, issuing to subscribers a corrected reprint, and delaying the publication of the second volume. Meyer's *Lexikon* commenced publication on Jan. 1 of the present year, and is going regularly forward. The twelfth edition of Brockhaus's well-known *Conversations-Lexikon*, announced for the beginning of this year, has not yet made its appearance.

THE Dublin University Shakspeare Society—which, though not a branch of the New Shakspeare Society, is in close union with it—held its inaugural meeting on Friday, the 10th, when the president, Dr. Ingram—formerly Professor of English Literature, and now Professor of Greek, in Trinity College, Dublin—delivered an address on “The Chronological Order of Shakspeare's Plays.” The means for determining this were (1) external, the dates of entry in the Stationers' registers, of allusions in the plays, or references to them, &c.; (2) internal, the verse-tests—a. the end-stopped line giving place to the broken line; b. the weak monosyllabic ending; c. dissyllabic endings; d. rhyme; e. Mr. Spedding's pause-test, which indeed includes a and b. Professor Ingram undertook to test all Shakspeare's late plays by test b. He gave an account of Mr. Fleay's investigations, and criticised them; arranged the plays in four periods, and showed the value of the verse-tests in distinguishing the genuine work of Shakspeare, as proved by Mr. Spedding's paper on *Henry VIII.* and Mr. Hickson's on the *Two Noble Kinemen*, when confirmed by the tests of Mr. Fleay and Mr. Furnivall. The Professor dwelt on the importance of the Dublin Society keeping its work parallel with that of the New Shakspeare Society, and read a letter of goodwill from Mr. Furnivall, containing suggestions as to lines of work.

THE Harleian Society is about to publish (volume for 1875) the Marriage, Baptismal, and Burial Registers of Westminster Abbey, edited and annotated by Colonel Chester, who has generously presented to the Society the materials which, during ten years' labour and at great personal expense, he has collected for their illustration. The historical value of these national archives, which the Dean and Chapter freely placed in the hands of Colonel Chester, is well known. It will be remembered that some thirty years ago a partial and unfortunately very inaccurate copy appeared in the late Mr. Nichols' *Collectanea Topographica*. Colonel Chester's work will include the whole of these registers down to the present time, and will be extensively illustrated by genealogical and critical notes, among which will be found identifications and discoveries of the greatest possible historical interest and importance. To the future genealogist, biographer, and historian, the volume will be invaluable. Only a limited number of copies will be printed, exclusively for members of the Harleian Society. Persons desirous of possessing a copy will do well to make an early application to the Honorary Secretary, George W. Marshall, LL.D., Hanley Court, Tenbury, Worcestershire.

In an article in the new number of the *Quarterly Review*, entitled “Irish Home Rule in the Eighteenth Century,” a sketch is given of the condition of Ireland at the time when it was in possession of an independent Parliament. The sketch is mainly based on Mr. Froude's *English in Ireland*, of which the article is a review. The conclusions drawn are by no means complimentary to the Irish, and lead up to the declaration that the kindest and most effectual remedy for the evils of Ireland would be to convince the Irish that Home Rule can never be granted.

AN article in the same journal, which we understand to be from the pen of Mr. S. R. Gardiner, “The alleged Apostasy of Sir Thomas Wentworth,” is written with a view to clear the character of the great minister of Charles I. from the charge of having, at the very outset of his career, suddenly deserted the cause of the people in order to accept office under the crown. Not by putting a new interpretation upon evidence which previous writers on this period have brought forward, but by the production of contemporary documents which have escaped their notice, is this sought to be accomplished. Among the Domestic State Papers of this reign are preserved some short-hand notes taken in the House of Commons by Edward Nicholas, Buckingham's Secretary; and Harleian MS. 4,771 contains a diary of proceedings in the Parliament begun on March 17, 1628. These important materials for the history of the third Parliament of Charles I. have been hitherto most unaccountably overlooked. Making good use of his discovery, the reviewer is able to trace Wentworth's policy, as made known by his speeches, day by day throughout the whole of this memorable session, and to show the consistency of his conduct from the beginning to the end of it. To our mind, after a careful perusal of the new evidence brought forward, it appears established beyond all manner of doubt, that “the conditions upon which the charge of apostasy was founded never really existed.” We fear, however, to weaken the force of the proofs by the short summary to which we should of necessity be obliged to confine ourselves, and so can only advise all interested, whether as admirers or the reverse, in this most fascinating character of English history, to read and judge for themselves.

MESSRS. DIDOT have just published a book which throws very considerable light on the earlier part of the reign of Louis XVI. It contains the secret correspondence between the Comte de Mercy-Argenteau and the Empress Maria Theresa, together with the correspondence between Marie Antoinette and her mother, edited from the originals in the State Archives at Vienna by MM. A. d'Arnoeth and A. Geffroy. This correspondence completely disposes of the accusations brought against the conduct of Marie Antoinette. It throws considerable light on the subject of the first partition of Poland, and proves that attempts were made at Vienna to obtain the direct intervention of the Dauphiness, as also in 1778, on the occasion of the war of the Bavarian succession, which was ended by the Peace of Teschen. It shows also for the first time the great part played by Marie Antoinette in the fall of Turgot, whom she wished to have not only dismissed, but also sent to the Bastille. In this instance she was not acting at the instigation of her mother, but was rather carried away by personal feelings and the influence of those around her. We hope to review this work at length at a future day.

M. CHARLES ROMÉY died at Paris a few days ago. He published the first ten volumes of his *History of Spain* in 1848, but the work unhappily has made no further progress.

It was known from a passage in a work of the twelfth century that Suger, the famous Abbé of Saint-Denis, had undertaken a life of Louis VII., but no traces of it had ever been found. Now, however, M. Jules Lair has found among the documents from Saint-Germain-des-Prés the beginning of a life of Louis VII., which dates from the twelfth century, and he has attributed it to Suger in a tract entitled *Fragment inédit de la Vie de Louis VII., préparé par Suger*.

THOSE who are interested in tracing the early change in the Teutonic kingship from a semi-elective to a hereditary institution will be glad to know that the subject has received indirect illustration from Professor Gindely's researches into the constitutional history of nations in which the development took place at a later period. Having already established the fact that in 1617

the Bohemians acknowledged the Ferdinand who was afterwards the Emperor Ferdinand II, as their king by right of inheritance, he has now published the result of his investigations into the progress of the change in Hungary in a pamphlet of forty-four pages, under the title of *Ueber die Erbrechte des Hauses Habsburg auf die Krone von Ungarn*. The result at which he arrives is that “from 1526 to 1687 the male descendants of Ferdinand I. possessed a family right to succeed to the throne, but that the Diet was empowered to elect any one of the number as King of Hungary.”

WE are glad to see that, in spite of the political misfortunes of Spain, the *Revista de Archivos Bibliotecas y Museos* is still flourishing in its fourth year. It is published twice a month, and, besides questions and replies after the fashion of *Notes and Queries*, it contains a large proportion of original documents. The number for Feb. 28 contains a paper of instructions given by a Spanish ecclesiastic to an ambassador going to Rome in 1600, some points of which are worthy of the country of Sancho Panza. Thus—

“Never let your Excellency treat on matters of State with religious persons (i.e. monks and friars), as they have no experience in them, and as they, having been brought up in their cells in discipline and devotion, have so depressed their thoughts that they never give any heroic or spirited counsel, and only give ear to their own interests or to scruples which mix too much water with great actions, and are generally unable to hold their tongues, except in matters of confession.”

Or thus—

“Let your Excellency take care not to favour any one, to hate any one, or to get excited with any one. By these three cautions you will be held to be a wise man and a saint.”

NOTES OF TRAVEL.

DR. GEORGE H. KINGSLEY has returned from his expedition to the Yellowstone River.

THERE was a great overflow of the Tigris last month. The water rose to the top of the dykes, which, however, having been strengthened and increased, successfully resisted the pressure. In Lower Mesopotamia the Euphrates and the Tigris united, and formed a single river.

COLONEL JILINSKY has reported to the Russian Imperial Geographical Society the results of the expedition sent in 1873 to examine into the possibility of draining the marshes of Pinsk. Only the fifth part of these marshes, which cover an area of 60,000 square versts, has as yet been explored; but the drainage is reported possible by means of 1,500 canals running into the Pripiet or its affluents, especially the Slovetchnaia and Ouscha. These canals would allow the water now stagnant to run off, would improve the soil, and feed the rivers, which would then become navigable. The expenses of the work are estimated approximately at 3,000,000 roubles.

THE French Alpine Club, which is now being organised, will have to deal at an early date with the Memoir addressed to the French Government by the English Alpine Club on the subject of a reform of the corps of guides. The Memoir states that, owing wholly to the number of incompetent guides at Chamounix, five accidents, causing the death of nineteen persons, have occurred on Mont Blanc within the last few years, and that the place will be deserted altogether unless some reform is speedily introduced. It, therefore, suggests that henceforward the examination for admission to the corps of guides shall be placed in the hands of competent persons who are strangers to the locality; that the head guide shall be nominated by the superior authorities instead of by the guides themselves; that every tourist shall be allowed to select his own guide, a privilege enjoyed at present only by members of the Alpine Club; that a register shall be kept of

the conduct, expeditions, &c., of every guide; and, lastly, that the tariff shall be reduced. The guide's fee for the ascent of Mont Blanc is 100 francs, the same as that paid for the far more difficult Matterhorn; while the guide for the Col du Géant is paid only 50 francs; for the Col d'Argentière at Orsière, the Col de Miage at Courmayeur, and the Col de Trelatête, only 60 francs in each case, while the ascents of the Aiguille Verte and the Grandes Jorasses cost 80 francs. All these ascents are more difficult than that of Mont Blanc. The Memoir, therefore, ends by urging the modification of the tariff, not only because it is disproportionate, but also because the conditions made to meet the case of an unsuccessful attempt are so unfavourable to the guides as to tempt them to imprudent acts which often prove fatal to tourists.

PROFESSOR BASTIAN, of Berlin, has received favourable news from the German expedition on the west coast of Africa. Dr. Gussfeldt, who is at the head of the expedition, has advanced into the interior, and reached the Fangela country, which, it is believed, is the right point for further advance into Central Africa. The travellers at the latest dates were at the station of Chinchato, and were busied with the preparations for the more important expedition.

THE recent numbers of Petermann's *Geographische Mittheilungen* contain a very interesting report of Count Wiltschek's Arctic Expedition to the north-east districts of Russia. The fourth number of this year's series gives a chart of the coasts of Waigatte in North Greenland, with explanatory annotations by Steenstrup, and includes amongst other papers a review of Gosse's and Warburton's *Travels in Western Australia* (1873-1874), together with a map of the district, and a summary of our geographical knowledge in regard to this region up to the present year. Colonel Warburton in the course of last February reached Perth from Adelaide, and thus accomplished the aim of the expedition in which he had taken part, while at the same time he has succeeded in throwing considerable light on a hitherto unknown part of the interior of Western Australia. As yet we know none of the particulars of Warburton's explorations, but Petermann's journal gives us very interesting details in regard to the expedition conducted on behalf of the South Australian Government by Mr. Gosse, who has penetrated much further west than the point reached by Mr. E. Giles, although he was not able to continue his course in the direction proposed, and was forced to retrace his steps before he had arrived at the West Australian settlements, for which he was bound. His partial want of success is ascribed by himself and others to the fact of his having only horses to depend upon, whilst Colonel Warburton was provided with camels for the transport of his supplies.

THE *Levant Herald* states that his Excellency Nubar Pasha, Egyptian Minister for Foreign Affairs, has addressed the following circular to the foreign consuls in Egypt:—

"CAIRO, March 8.—Sir, the establishment, maintenance, and working of the three existing locks on the Nile and of the flood-gates at Alexandria in communication with the sea have occasioned and still render necessary considerable expense. To relieve the Administration of a portion of these charges, the Government of the Khedive has had to follow its usual course in such cases. It has called upon those who profit by the locks to contribute to the expenses by means of a tax fixed at the lowest possible figure. This tax has been collected for several years past at the locks of the Nile. Six other locks are now working on the Canal from Ismailia to Suez—i.e. four on the course of the Canal, and two communicating with the sea. The establishment and working of these six locks have necessitated heavy outlay. The Government has, consequently, decided to take, as regards these locks, the same measures as for those on the Nile. Wishing, however, to make a tax as light as possible, it has taken as a basis the tax paid at the

three locks at Alexandria, and has divided this amount among the four locks on the Ismailia Canal in the following manner:—The total tax for the three Nile locks is 30 paras per ardeb on empty barks, 45 paras on barks half laden or less, and 90 paras on barks carrying more than half a cargo up to a full cargo. The total tax for the lock at Alexandria communicating with the sea is 20 paras per ardeb on barks fully or partially laden, and 5 paras on empty barks. For the four locks on the Ismailia Canal, Nos. 16, 42, 68, and the lock above Ismailia, the tax will be for each lock, and per ardeb, $7\frac{1}{2}$ paras on empty barks, $11\frac{1}{2}$ paras on barks half laden or less, and $22\frac{1}{2}$ paras on barks carrying more than half a cargo to a full cargo. Respecting the two other locks, one at Suez and the other below Ismailia, communicating between the Canal and the sea, the tax will be per ardeb 20 paras on barks fully or partially laden, and 5 paras on empty vessels, according to the tax levied at the Alexandria lock. Vessels laden with ballast only will pay as empty vessels, and be under the same regulations. Vessels not provided with plates will in all cases pay a double tax. Double tax will also be levied on barks which on account of low water require the aid of hydraulic machines to enable them to pass. This is on the same system as applied to the locks on the Nile. The execution of this measure will commence thirty-one days after the date of the present communication. The local authorities under whom the control of the locks is placed have received instructions to this effect. I request you, Sir, to be kind enough to communicate it to your compatriots for their guidance, and am, &c., NUBAR."

JERUSALEM, it will surprise no one to be assured by the most recent commercial reports from there, is one of the least commercial or industrial of cities. Its population is estimated at 18,000, of whom about 5,000 are Mohammedans, 8,000 to 9,000 Jews, and the rest Christians of various denominations. The chief native industry is the manufacture of soap and what is called "Jerusalem ware," consisting of chaplets, crucifixes, beads, crosses, and the like, made principally of mother-of-pearl and olive-wood, and sold to the pilgrims who annually resort to the Holy City to the number of 6,000 to 8,000. No mines are worked, although it is known that sulphur, bitumen, and rock-salt are found on the shores of the Dead Sea; but security and capital are wanting, and so long as these are absent, the probable wealth to be abstracted from these regions will remain unavailable. No factories are to be met with. The employment of the people is almost wholly agricultural and pastoral. The road between Jaffa and Jerusalem, never of the best, has been allowed to fall into such disrepair that none but the roughest kind of vehicle could now traverse it. The other roads of the district are of a wretched description. With these improved, more complete security established against the predatory Bedouin tribes inhabiting the outskirts of the districts, and certain administrative reforms, whereby encouragement would be given to bring under cultivation the vast and fertile plains now only partially tilled, there can be no doubt that the country could support a population many times larger than its present scanty number of poverty-stricken inhabitants.

THE rapid advance which the Argentine Republic is making, notwithstanding all obstacles, is very remarkable. Railways are extending themselves, and traffic increases, though outside the towns there is not a road, properly so called, by which to approach a railway station. Bridges have been erected over the principal streams, but the approaches are so neglected as to render the bridges almost useless. The city of Buenos Ayres is completely changing its aspect; new houses are springing up on every side, the streets are being paved with granite blocks, and tramways traverse the city in every direction. The value of land and house property in the town and neighbourhood has increased enormously, though this to some extent is owing to wild speculation. One remarkable circumstance is the dependence of this country upon others, for with the exception of bread, meat, and vegetables, there is hardly an

article of daily consumption which is not introduced from abroad. Nothing shows the progress in the republic better than the statistics of education. In 1862 there were 22,000 children attending the public school; in 1872 there were 80,000. Between the same years the national colleges increased from two to fourteen.

A REMARKABLE instance of a country in spite of recent political convulsions becoming rich and prosperous beyond the most sanguine expectations, is afforded in the case of Poland. The most trustworthy evidence of this is given by the report of Consul-General Mansfield, which has just been made public. Polish fabrics of every kind are gradually driving out of the market, both for the kingdom itself and the empire of Russia in general, a vast number of articles of inferior quality hitherto imported from Germany, and the industrial production for exportation into Russia is assuming very large proportions. In many cases the contractors can hardly meet the demands. Labour has risen in price in the same ratio, and active and intelligent hands find ready employment at a remuneration quite out of proportion with the price of living. The population is undergoing a steady increase, no emigration takes place for America or elsewhere, and the number of Jews who run away to escape military service is more than counterbalanced by the return of exiles from Russia, Siberia, and abroad, under the provisions of various Imperial amnesties. The convention with Austria respecting the salt mines in Galicia has terminated, and the Report from which we quote points out that there will be a large opening for the Liverpool dealers in salt, which is well worthy the attention of those firms; they should be early in the field, and acquire the business immediately, before it can get into German hands.

THE *Revue des Deux Mondes* of April 15 contains a pleasant and chatty article by M. George Bousquet, entitled "L'Illiver au Japon," in which the writer describes an excursion he made to Nikkô during the past winter. Nikkô, as our readers may possibly be aware, is a lovely spot in the mountains about eighty miles north of Yedo, and one of the three burial-places of the Shôguns. Hitherto, we believe, very few foreigners have seen this place, at any rate in the depth of winter, and M. Bousquet's paper possesses the greater attraction on that account; two years ago, however, Mr. Adams and Mr. Satow, of her Majesty's Legation, made a careful inspection of it, and the latter gentleman, a well-known Japanese scholar, published some of the results of his observations in the *Yokohama papers*. Instead of taking the direct road to Nikkô, M. Bousquet chose a circuitous route, almost unknown to Europeans, and half his article is devoted to a description of his journey, in the course of which he alludes briefly to some of the curious customs of the Japanese with regard to the burial of the dead, and he incidentally informs us that, while the question of introducing "cremation" is being agitated in Europe, the Supreme Council of Japan has decreed that in future all sects shall bury their dead, and not burn them. Having reached his destination, and before beginning the pilgrimage so dear to all Japanese, M. Bousquet says a word about the origin of Nikkô, and informs us that it dates from the end of the fifteenth (sixteenth) century, and was intended to perpetuate the remembrance of the submission of the Koreans. M. Bousquet visited the gorgeous shrine of Gongen-sama (known as Iyéyasu in his life-time), the founder of the Tokugawa dynasty, but he spent the principal portion of his time in shooting expeditions and in making excursions to neighbouring points of interest in the mountains. In our opinion—and we speak with due deference to his knowledge of Japan—M. Bousquet makes two somewhat serious mistakes in his paper: the one is in calling the "Shôgun" the "Taïcoun" (Tycoon), an error which we thought was long since exploded; and the other in stating that at Nikkô

are "les tombeaux des deux taicouns successeurs de Hieyas" (more usually, and, we think, more correctly written *Iyéyasû*), whereas the best and most recent authorities assert that, besides *Iyéyasû*, only his illustrious grandson, *Ivémitsû*, is buried there; and that of the other twelve Shôguns of the Tokugawa dynasty, six were buried at *Zôjôji* and six at *Uyéno*.

CORRESPONDENCE.

ETRUSCAN RESEARCHES.

Cambridge: April 15.

Professor Müller's articles in the *ACADEMY* of April 4 and 11 enable us to estimate aright the worth, or rather the worthlessness, of Mr. Taylor's *Etruscan Researches*. He has produced a goodly list of passages which "no scholar could read without shivering," and I have indicated others in the pages of a contemporary journal. I should wish, however, with your leave, to increase the number by two, to which Mr. Taylor himself evidently attaches much importance.

At p. 266 Mr. Taylor says:—

"The Etruscan name *ATH*, or *AT*, as it is sometimes written, is of great interest. It was borne by the Emperor *Salvius Otho*, who was of ancient Etruscan lineage, belonging, we are told, to the *principes Etruriae*. It may also be identified with the name *Ete*, which was borne by the chieftains of the fourth of the seven Magyar tribes at the time of their settlement in Hungary. It seems also to form the first portion of the name of *Oth-man*, the great Turkic sultan from whom the *Otho-man* empire and the *Osmanli* language take their name."

Regarding *Otho* and *Ete* let others speak; but I know that *Othman*, *Osman*, *Usman*, *Ottoman*, are only different ways of transcribing the purely Arabic name '*Othmān* or '*Uthmān* (with a '*ain* for its initial letter, *rad*, '*athama*'). As a common noun, '*uthmān* is said by the Arab lexicographers to mean "the young of a bustard" or "the young of a snake." Consequently Mr. Taylor's comparison with the Turkish *ât*, "a horse," falls to the ground.

Again, at p. 376, Mr. Taylor says:—

"Now in the language of the Kourds, an Aryan race inhabiting the mountainous frontier of Persia, and contiguous to the land of Turan, the word for 'robber' is *rakhsen*. Also in Persian a 'robber' is *razen*. These designations can at once be accounted for, if we suppose that at some remote period a marauding nation, which bore the name of *Rasenna*, pitched its tents in the Turkoman steppe."

It will probably afford Mr. Taylor but little pleasure to learn that *razen* and *rakhsen* are merely different ways of writing the Persian *rāh-zan*, "a robber." The highwayman is called in Persian "the road-smiter," from *rāh*, "a road," and *zan* (Sanskrit *han*), the root of *zadan*, "to strike," the corresponding Arabic phrase being *kaṭi'u 't-tariq*, "the cutter of the road." Therefore any comparison of *razen* with *Rasenna* is out of the question.

Professor Müller will, I hope, excuse my correcting a slight mistake into which he has fallen in his second article. *Verd*, "a rose," in Turkish is not "a Persian, i.e. an Aryan word," but an Arabic, i.e. a Semitic word. There can, however, be little doubt of the identity of the Arabic *ward*, Aramaic *wardā*, Greek *πόρον* or *βπόρον* (i.e. *vrodon*), and modern Persian *gul*.

W. WRIGHT.

THE "REDUNDANT AND" IN BALLADS.

MILL HILL: April 20.

In Aasen's *Norsk Ordbog*,* Christiania 1873, the author says under "Og, and: Poems and verses often begin with *aa*, which is probably=*og* (and), but is usually employed as a mere introductory word without any defined signification whatever; e.g. *Aa det var Raamund Bondeson* (and it was Raamund Bondeson)." In a notice of the *Ordbog* in the last number of the *Zeitschrift für Deutsche Philologie*, by F. Liebrecht, the reviewer says in reference to this passage, "One of the best authorities on the popular poetry of the North, Professor Svend Grundtvig, author of the classical work *Danmarks Gamle Folkevise* (Ancient Popular Customs of Denmark) communicates to me the following note on the above passage: 'Ivar Aasen's remark upon the superfluous *og* (which in Denmark as well as Norway is pronounced *å*) is quite correct. It is found everywhere in our popular poems of the sixteenth and seventeenth century, but most frequently in the latter. According to my view it is a mere rhythmicomusical expletive, and of no grammatical significance. Of course there are many cases in which one may be in doubt, or at least raise a doubt, whether a copulative meaning does not belong, or may not be attributed, to this *og*, even when it begins a new sentence or verse. But where an entire poem begins with *og* (care being taken that it is a genuine beginning), it may with certainty be explained in the way in which I explain it in thousands of other positions, viz. as a mere expletive without any copulative meaning. Thus in *Danmarks Gamle Folkevise*, No. 12, B. 1: *Oc det vor rigeste Raanegardt* (this piece contains the same merely expletive *oc* in v. 2, 4, 5, 6, 7, 8, 9, 10; compare version A, where it is not found); No. 48, A. 1: *Og jomfruen bejler til ridderen skøn*.' Professor Grundtvig then produces thirteen other instances, and closes with the words 'The same peculiarity is quite as common in Norwegian and Swedish as in Danish poems.' Whence (says Liebrecht) it appears that the Norwegian *aa* stands at all events for the Danish *og*, Swedish *och*, however this use of the word is to be explained, and that we are to recognise also the corresponding word *and* in English ballads, although in particular instances it may be possible to explain it otherwise, as, for example, in the old ballad of *Chery Chace*, which begins:—

'The Persé owt of Northumberlande,
And a vow to God made he.'

where Mr. Furnivall changes *And a vow* into *An avow*, a reading which Mr. Skeat (*ACADEMY*, 1871,

No. 17, p. 123) considers proved by the occurrence of the form *avow* in another verse of the poem (Fit 2, 157); but this *and* cannot in all places be thus lightly set aside; rather is the observation of Abbott 'it is common in ballads and very nearly redundant,' to be upheld in its integrity, and by no means to be limited to a small number of corrupt places." From the testimony here adduced, it would appear that whether or not Mr. Skeat is correct in thinking that "*And a vow* is nonsense," and that "the popularity of *Chery Chace* has induced many to believe that *and* could sometimes be thrown in as an expletive at the beginning of a sentence, but . . . if other instances occur, they are ignorant imitations," such a use of *and* is common enough in all the Scandinavian ballads. Leaving the expletive use of *and*, I may say that I used always to read it in this instance as a copulative conjunction, taking *out* in accordance with strict Northern usage to be here used as a verb = *eruit*, not *er*. In the Northern, and probably other English dialects, nothing can be commoner than such phrases as "as soon as he saw them, he *out*, and fetched them in," "I *up*, and dressed myself," "we *in*, and spoke to them," "John *out* with it, as soon as he met me," &c. I think I have met with many such phrases in Shakespeare. I do not mean to uphold this interpretation as the proper one here; but I mention it, because, through reading the passage in accordance with this familiar use of *out*, the *and* never seemed to me otherwise than perfectly natural and regular, and I should think that many Northern readers would have the same tale to tell as to their spontaneous and uncritical, though not necessarily correct, apprehension of the lines.

JAMES A. H. MURRAY.

SHAKSPERIAN VERSE-TESTS.

Trinity College, Dublin: April 18.

Will you allow me to say to readers of the *ACADEMY*, what I hope soon to prove in detail, that one of the most valuable, if not the most valuable of all verse-tests for the chronology of Shakspeare's later plays is one to which Mr. Fleay and others are giving little or no attention.* I mean the "weak monosyllabic ending," which is not at all necessarily implied by the "unstopped line," and must be quite separately considered. It was used to some extent by Mr. Bathurst, and was pretty fully described and exemplified by the late Professor Craik in the Prolegomena to his edition of *Julius Caesar*. Mr. Spedding, with his usual clear-sightedness, has perceived its importance, and has noticed it in his recent letter to the New Shakspeare Society on the "Pause-test;" of which last, indeed, one very common form of the "weak ending" may be regarded as a particular case. This test (the "weak ending") establishes clearly two propositions which are opposed to Mr. Fleay's conclusions—viz. (1) that *Julius Caesar* was much earlier than the two other Roman plays, and belongs, not to the fourth, but to the third period; and (2) that *Cymbeline* belongs, not to the third period, but to the fourth. It also brings out the proper places to be assigned in a chronological scheme to Shakspeare's portions of *Pericles* and of *Henry VIII*.

JOHN K. INGRAM.

ON THE PLAY CALLED "EDWARD THE THIRD."

Skipton: March 30, 1874.

In preparing for my paper on the plays called *Henry the Sixth*, I have necessarily had to examine, with much greater minuteness than any one has hitherto done, all the plays that have been attributed to Shakspeare, but not generally received as his. Among these there is none that is so worthy of note as *Edward the Third*. I should not, however, have published any notice of it until my sixth paper for the New Shakspeare Society had been read, had not the *Athenaeum*

* Mr. Furnivall brought it forward, as fixing the place of *Cymbeline*, at the first meeting of the New Shakspeare Society.—Ed.

of Saturday last printed a letter of Mr. Collier's advocating an hypothesis which I am certain no one can hold who has given the subject a minute investigation. I will give my reasons for this assertion presently, but must first give my own hypothesis and the facts which support it.

The play in question consists of two parts—one, which forms the main bulk of the play, relates to the foreign wars of King Edward; the other, which consists of two scenes and part of a third, contains a narrative of an attempted seduction of the Countess of Salisbury by the same monarch. These parts are distinctly different in general style and poetic power; so much so, that none but the dullest of prosaic readers could fail to note the differences: they are also clearly separated by metrical characteristics of the most pronounced kind. They are equally distinguished by the use or disuse of special words; and the personages common to the two portions of the play—for example, the Black Prince—have different characters in those portions, and are unequally developed. In my opinion, the episode is by Shakspeare; the main part of the play not. I will first consider the episode. From the entrance of the king in Act i. sc. 2 to the end of Act ii. sc. 2, this play is not taken from the chronicles of Holinshed, but from Painter's *Palace of Pleasure*. This is the part from which Mr. Collier (by one of those remarkably lucky hits which distinguish him among men) has happened to select *all* his quotations given to prove that the drama is Shakspeare's from end to end; that it is *no doubtful play*; that the three last acts are all conducted with *true Shaksperian energy and vigour*. To give the reader a fair chance of judging on this point, I give passages from both parts of the play.

Edw. When she would talk of peace, methinks her tongue

Commanded war to prison; when of war,
It waken'd Caesar from his Roman grave
To hear war beautified by her discourse.
Wisdom is foolishness but in her tongue;
Beauty a slander but in her fair face:
There is no summer, but in her cheerful looks,

No frosty winter, but in her disdain.
(Act ii. sc. 1, quoted by Mr. Collier.)

John. At sea we are as puissant as the force
Of Agamemnon in the haven of Troy:
By land with Xerxes we compare of strength,
Whose soldiers drank up rivers in their thirst:

Then, Bayard-like, blind overweening Nod,
To reach at our imperial diadem,
Is either to be swallow'd of the waves,
Or hackt apieces when thou com'st ashore.

(Act iii. sc. 1, not Shakspeare's.)

Count. For where the golden ore doth buried lye,
The ground undeck't with nature's tapestry,
Seems barren, sere, unfertile, fruitless, dry,
And where the upper turf of earth doth boast

His pied perfumes and party-coloured cost,
Delve there, and find this issue and their pride

To spring from ordure and corruption's side.
(Act i. sc. 2, Shakspeare's.)

Cit. The sun, dread lord, that in the western fall,
Beholds us now low brought through misery,
Did in the orient purple of the morn
Salute our coming forth, when we were known;

Or may our portion be with damned fiends."
(Act v. sc. 1, not Shakspeare's.)

I might fill pages with passages like these, but these, I think, are enough; the difference is felt at once. The second and fourth are totally unlike Shakspeare; the first and third are just what he might have written between *Richard II.* and *John*. In the episode we also find expressions such as *hugg, vasture, muster men, via, imperator, encouch*, which are either of frequent occurrence in Shakspeare, or have the true ring of his coinage in them. We find, moreover, two new characters introduced (Derby and Audley), who appear in-

deed in the after parts of the play, but developed after a totally different fashion from the masterly sketch of their first appearance; and above all, we find one character, Lodowick, the king's poet-secretary, introduced in the episode only, who in a play entirely from Shakspeare's hand would certainly not have dropped out of sight so early, but have been utilised to the very end. The delicious pedantry of the man, whose attempt at verse consists of the two lines,

"More fair and chaste than is the queen of shades,
More bold in constancy than Judith was;"

who talks in inversions:

"Of what condition or estate she is,
"Twere requisite that I should know, my Lord;"

who tells the king, when enquiring for the above poem,

"I have not to a period brought her praise,"

is worthy, if not of the author of Polonius' advice to his son, at least of the author of the scene of Pandarus' love-song.

But it will be objected, Why do you give us these vague unscientific statements? Where be your rhyme-tests and double endings? Where your un-Shaksperian words that can be counted and tabulated? They are all at hand, good reader. Here they are.

In the episode, the proportion of rhyme-lines to verse-lines is one to seven; in the other parts of the play, one to twenty; in the episode, the proportion of lines with double endings to verse lines is one to ten; in the rest of the play it is one to twenty-five. These differences are far too great to allow the play to have been all written by one author at one period; and if the play be Shakspeare's work throughout, it would be necessary to suppose that the worst part of the play was written in his later time, with *Lear* and *Othello*; or, if I may not be allowed to presume so far on the results of my applications of metrical tests (though to the development of Shakspeare's work they are, I am certain, our surest guide), then I appeal to a different kind of evidence altogether.

In the main part of this play there are many words used that never occur in undoubted Shaksperian plays, however often certain of them may be found in Marlowe, Greene, and other early dramatists. For instance, *bonny*, which occurs in 1 *Henry VI.* and 3 *Henry VI.*, but is unknown in Shakspeare, occurs in Act i. sc. 2 three times, and *bonnier* in Act iii. sc. 1. So the strange verb *to patronage* occurs in Act iii. sc. 3, and in 1 *Henry VI.*, never in Shakspeare; *horizon* (Act v. sc. 1), *Ave Caesar* (Act i. sc. 1), *whinyard* (Act i. sc. 2a), *Bayard* (Act iii. sc. 1), *Nemesis* (Act iii. sc. 1), *martialist* (Act iii. sc. 3), *plate*, in the Spanish sense of silver (Act i. sc. 2, Act iv. sc. 4), *solitariness* (Act iii. sc. 2), *quadrant* (Act v. sc. 1), *ure* (Act i. sc. 1), are all words unknown to Shakspeare's vocabulary. *Battle-ray* occurs in Act iii. sc. 3, and Act iv. sc. 3; Shakspeare does not even admit the common form *'ray* for *array*, while *'rayed* is found in the part of *The Taming of the Shrew* not Shakspeare's. *Burgonet*, another word in this play, occurs only once in Shakspeare in a very late play, *Antony and Cleopatra*, while it is found in 2 *Henry VI.* three times. So the anomalous word *expulsed*, which we find in 2 *Henry VI.*, but not in Shakspeare, will be seen in Act iii. sc. 2 of this play of *Edward III.*; and in Act v. sc. 1 the unusual verb *to quitance*, as in 1 *Henry VI.*, but not in Shakspeare. *Cataline* in the *True Tragedy of the Duke of York* has been replaced by Machiavel in 3 *Henry VI.*, but remains undethroned in Act iii. sc. 1 of our play. But to go on with this list would be tedious: to make it complete, this is not the place. In the Transactions of the New Shakspeare Society we hope to collect all the possible evidence of this kind, regardless of the sneers of the idle, who want the reputation of work without the fatigue, or the cavils of the ignorant, who cannot understand our motives or our methods. We are much hindered at present by having to

make fresh collations, &c., which ought to have been long since done reliably to our hands, as to these doubtful plays; but time will show what our after work is worth if we live to finish it, and if not, the next receivers of the torch, we are determined, shall not be deceived in this respect; they shall find all our work genuine and truthful; our foundation, though humble, shall be firm; our transcripts shall be free from imaginary interpolations, and our texts from ingenious but delusive guess-work.

But I must not enlarge on this; I must return to our play. I recommend any one who has been deluded by Capell, or his German copiers, or his English reproducers at third hand, into the belief that this work is all Shakspeare's, to read from the entrance of the King in Act i. sc. 2, to the end of Act ii. by itself, and judge if that part be Shakspeare's, as I say it is; then to stop awhile, and read all the rest of the play by itself, noting the monotonous thud of the antique stop-line and the un-Shaksperian words I have given above, and judge if any part of that be Shakspeare's. If he say yes, he is not one I should care to argue the point with, for to such a one even the scientific metrical test would be of no avail for his enlightenment. He might even agree with Mr. Collier in saying, "I might quote the whole quarto, for it is *all his*." F. G. FLEAY.

P.S.—The New Shakspeare Society will publish all these plays in due course. This one is not wanted immediately, as the edition by Delius, published at Elberfeld, 1854, is very cheap, and, unlike some of our own reprints of about that date, singularly well collated and accurate.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, April 25,	1 p.m.	Sale at Sotheby's of the Engravings of the late T. Pemberton, Esq.
	3 p.m.	Crystal Palace Concert (Mr. Mann's Benefit).
	"	Royal Institution: Prof. Seeley on "The Age of the French Revolution."
MONDAY, April 27,	3.45 p.m.	Royal Botanic.
	1 p.m.	Sale at Christie's of the Collection of Drawings of the late J. Garle, Esq.
	6 p.m.	Philosophical Club.
TUESDAY, April 28,	7 p.m.	Institute of Actuaries.
	8 p.m.	Society of Arts; Cantor Lecture: Mr. F. Barff on "Carbon and Compounds of Carbon." (III.)
	"	Social Science Association: Mr. R. Hamilton on "Compulsion and other Means of carrying Primary Education to all Classes."
WEDNESDAY, April 29,	8.30 p.m.	Medical.
	1 p.m.	Geographical.
	1 p.m.	Sale at Sotheby's of Mr. Emerson Norman's Collection of English Pottery and Porcelain.
THURSDAY, April 30,	3 p.m.	Royal Institution: Prof. Rutherford on "The Nervous System."
	8 p.m.	Society of Arts: Col. J. C. Gawler on "The History, Progress, and Prospects of South Africa."
	8.30 p.m.	Civil Engineers. Anthropological.
FRIDAY, May 1,	4.15 p.m.	Royal Medical and Chirurgical.
	4.15 p.m.	Zoological.
	4.15 p.m.	Royal Society of Literature.
SATURDAY, May 2,	7 p.m.	London Institution: Prof. Morley on "The English Poets of the Nineteenth Century." (IV.)
	8 p.m.	Society of Arts: Mr. J. Spakes on "Some Recent Inventions and Applications of Lambeth Stone-ware, Terra Cotta, and other Pottery, for Internal and External Decorations."
	"	Geological.
SUNDAY, May 3,	1 p.m.	Sale by Messrs. Puttick & Simpson, of a collection of Music and Musical Instruments.
	"	Sale, at Sotheby's, of Mr. Brett's Collection of Sévres, Dresden, &c.
	3 p.m.	Royal Institution: Mr. W. N. Hartley on "The Atmosphere."
MONDAY, May 4,	6 p.m.	Royal Society Club.
	8.30 p.m.	Miss Agnes Zimmermann's Concert (Hanover Square Rooms).
	"	Royal Antiquaries.

FRIDAY, May 1,	1 p.m.	Sale at Christie's of Mr. Two-penny's Porcelain, etc.
	2 p.m.	Royal Institution: Annual Meeting.
	"	Royal United Service Institution: Colonel V. Baker on "The Military Geography of Central Asia."
	4 p.m.	Archæological Institute.
	7.30 p.m.	Sacred Harmonic Society: Costa's <i>Naaman</i> (Exeter Hall).
	8 p.m.	Philological: Mr. Sweet on "The History of English Sounds." (III.)
	"	Society of Arts: Mr. H. G. Kennedy on "The Ruins of Cambodia and the Antiquities of Indo-China."
	"	Geologists' Association.

SCIENCE.

Allgemeine Ethnographie. Von Dr. Friedrich Müller. (Wien: Holder, 1873.)

THE reputation of Dr. Friedrich Müller has not yet extended far beyond the inner circle of the learned, to whom, indeed, he almost exclusively addresses himself; yet he certainly occupies a distinguished and original place among professional scholars. While the majority of contemporary philologists have confined themselves to the study of a single family of languages,—some of the Aryan, some of the Semitic,—few have had the courage or the ability to embrace a wider range of subjects, and Dr. F. Müller is almost alone in having written with equal competence upon the most widely differing branches of philology, producing works on the languages of America and Australia, no less valuable than those which he has devoted to Pali and Zend.

He was first tempted to step beyond the Indo-European territory by the task confided to him, some years ago, of drawing up the linguistic part of the report on the voyage of the Austrian frigate *Novara*, and from that time he conceived the project of tracing in one vast outline the picture of the whole human race. Numerous articles published in different journals (Behm's *Geographisches Jahrbuch*, *Mittheilungen der anthropologischen Gesellschaft zu Wien*) were practically advertisements and instalments of the projected work. Dr. Müller's ambition was to present to the public a work as extensive as Prichard's famous book, and to include, as Prichard did, all the materials collected by science at the time he wrote. But without renouncing this great task, the author has thought fit to sum up in a kind of manual the principal results of ethnographic science as it is at present constituted. Dr. Müller will not complain of our insisting on the words at present, for his science builds as yet upon a shifting soil, and systems succeed systems with perplexing rapidity,—systems, that is, of classification, of migrations and origins. Our knowledge of the nature and manners of the races which inhabit our globe continues steadily progressing; but most works on this subject, though interesting and amusing, are devoid as yet of a truly scientific character.

Dr. F. Müller's work, though professedly only a handbook, is really a large volume of 550 pages: 72 of which are devoted to the introduction,—that is to say, to the theory; the remainder to the description of the races,—that is, to the facts. It will perhaps be most useful to restrict our remarks chiefly to the introduction, which contains the author's

original ideas, most of which will not secure the reader's assent, though all deserve the attention of scholars, despite the rashness of some of the hypotheses.

Ethnography is often confounded with anthropology, and the distinction between the two sciences is not as yet clearly established, especially in the minds of anthropologists, who are constantly encroaching upon the domains of ethnography. Ethnography is the science of *peoples*,—that is, of man considered collectively; anthropology is the science of *man*, considered as man,—that is, as an individual. The difference between the two sciences consists less in the subject which they treat than in the point of view from which they contemplate it; both alike are of modern origin, for it may be said that the German Blumenbach founded the first (*De Generis Humani Varietate et Natura*), and the Englishman Prichard the second (*Natural History of Man*).

The two sciences come into collision in the great problem which forces itself on everyone who aims at reconstituting the genealogy of the different groups into which mankind is divided, that of determining the relations between peoples and races. *Race* and *people* (or nation) are in fact terms of a very different character. The first, purely anthropological in significance, treats men as animals, according to the characteristics of their physical conformation, and, as such, directly subject to the laws of organic nature. The second, an ethnographic term, characterises man by his relation to the groups which he forms, and to the societies which are bound together within and made recognisable from without by the sign of a common language. The union of several *peoples*, whose mutual relationship is evidenced by affinity of language, forms a complex whole which in ordinary language is often, but erroneously, called a race, e.g. the Latin race, the Germanic race, &c. We say erroneously, for there is no unity in the physiological characteristics of the individuals which compose these groups. The flexibility of the German language makes it possible to avoid this confusion, by speaking, as Dr. Müller proposes to do, of a *Volkstamm* or family of peoples. To anthropology belongs the task of grouping men in races, and to ethnography that of grouping them in families of peoples.

There was evidently an age in the history of mankind when races did exist and peoples did not; but the inference which the author draws from this plausible hypothesis appears to us by no means evident: it is that, at the time when there were only races, man had not yet acquired the power of speech; he was still only the *homo primigenius alalus* of Haeckel, and it was only as he learnt to speak that peoples began to differentiate themselves. Anthropologists admit that *Volkstämme*, or groups belonging to the Indo-European, Hamitic, Semitic, and Basque families respectively, belong to the same race. Therefore they had no language before their separation.

This hypothesis is certainly convenient, and relieves its author from the necessity of making the divisions of races and of peoples agree, which is the rock upon which many systems have struck, but it is at the same

time purely arbitrary. If it is positively resolved to bring all these four families back to an original unity, it would be less hazardous to suppose (which Max Müller allows to be at least within the limits of scientific possibility) that at the time when the families now distinct were still united, their language was in a primitive state of mobility, in a kind of nebulosity, whence the most diverse forms could proceed, and once generated continue to diverge more and more as they followed their natural tendencies towards development. It seems to us that our science would do better to stop short in front of an insoluble problem, instead of attempting to give to mere guesses the form of an apparently scientific hypothesis.

The systems of classification hitherto adopted by anthropologists—and as promptly abandoned by them—seem to us to establish only one fact, that a satisfactory system has not yet been arrived at. They rest upon some one arbitrarily selected characteristic. Blumenbach, for instance, divided men into five races, according at once to their colour and their geographical distribution: the white, or Caucasian race; the yellow, or Mongolian; the black, or Ethiopian; the red, or American; the brown, or Malay race. The successors of Blumenbach have sometimes extended and sometimes abridged this classification. Cuvier admitted three races only: the white, or Caucasian; the yellow, or Mongolian; the black, or Ethiopian. Pickering recognised eleven; George Morton seventy-two. Other anthropologists have thought that the skull was too important an organ of the human frame not to afford an exact criterion. The most famous classification made from this point of view is that of the Swede Retzius, who, combining the form of the skull and the features of the face, reduced the whole human species to four types, though his views as to their arrangement varied four times in the course of fourteen years. Thus in 1842 he placed the Afghans amongst the *gentes brachycephalæ orthognathæ*, and in 1856 amongst the *gentes brachycephalæ prognathæ*; the Persians, who in 1842 were *gentes brachycephalæ orthognathæ*, had become in 1856 *gentes dolichocephalæ orthognathæ*. Such changes sum up and symbolise the history of most anthropological classifications.

Dr. F. Müller adopts Haeckel's classification, which is regulated mainly by the character of the hair. He says: "Following the nature of the hair of the head, men fall at once into two great classes,—namely, the woolly-haired (*οὐλότριχες*) and smooth-haired (*λίσσότριχες*). Whilst among the former each hair is slightly flattened, like a riband; among the latter each hair is cylindrical, and if cut straight across the end appears circular. All woolly-haired races are long-headed (*dolichocephali*) and with projecting jaws (*prognathi*), and show accordingly the closest relationship to the ape type: they all dwell in the southern hemisphere, reaching to the equator, and a few degrees above. Within these two chief divisions, I. Woolly-haired, II. Smooth-haired, there are two subdivisions, based on a closer examination of the growth of the hair in both classes. First amongst the Woolly-haired: I. The tuft-haired (*λοφόκομοι*); II. Fleecy-haired (*ἐπίδοκομοι*): amongst the former the

hairs grow in separate tufts or locks, amongst the latter they are spread equally over the whole surface of the head. Similarly the Smooth-haired are divided into two sub-classes, — namely, I. Straight-haired (*εὐθύκομοι*), II. Curly-haired (*ἐμπλόκομοι*); the dark hair of the former hangs down stiff and smooth, whilst amongst the latter, black or fair hair falls down in more or less waving locks: with the latter quality there is connected a greater or less development of beard, which in the other divisions is entirely wanting or only faintly marked." Dr. Müller classes all the varieties of the human species as twelve races, divided as follows:—

I. Woolly-haired.	A. Tuft-haired	1. Hottentots.
	B. Fleecy-haired	2. Papuas.
II. Smooth-haired.	A. Straight-haired	1. African Negro.
		2. Kaffirs.
		1. Australians.
		2. Hyperboreans, or dwellers in Arctic regions.
		3. Americans.
	B. Curly-haired	4. Malays.
		5. Mongols.
		1. Dravidians.
		2. Nubians.
		3. Mediterraneans.

Dr. Müller afterwards divides these races into families, but begins thenceforward to make language both the starting-point and criterion. In point of fact, two only of these races, the Kaffirs and the Malays, correspond to linguistic families; perhaps the same might be true of the Papuas and Australians, if the materials were not too scanty to allow of the question being completely elucidated at present. With these exceptions all the races indicated by the author are polyglot, i.e. divided into families that are linguistically distinct.

The majority of ethnographers make the mistake of passing indifferently from physical to linguistic characteristics, relying in their genealogical classifications sometimes on one, sometimes on the other. The great merit of Dr. F. Müller is to have distinguished between these two heterogeneous elements. Instead of classing peoples *with*, he classes them *within* races, as subdivisions, so that the data of ethnography and anthropology can be distinguished at a glance, and all confusion between the two sciences is avoided.

Dr. Müller next discusses—following for the most part Haeckel and Darwin—the question of the origin and antiquity of man, his primitive country, and the probable age of the races now existing, while he enquires from what geographical centres and in what order the families (*Volkstämme*) which have detached themselves, like swarms, from the races, were first formed. The picture is brilliant, but is made up of inductions that become more and more hypothetical as we go farther and farther back. We decline to adopt the author's ideas, though it cannot be denied that his system is grandly conceived, self-consistent, and abounding in suggestions, if not in proof.

After these considerations, which form the philosophy of the work, the author describes the races and peoples enumerated in the order adopted in his classification. Here the facts occupy almost all the available space. In the case of each people he sums up all that is known of its physical conformation, its moral character, its religion, its manners, industry, migrations, and languages. The

only nations which, to our thinking, the writer treats too briefly are the Indo-European peoples, and of these especially the Europeans. He probably considered that they were already sufficiently well known to his readers, but it would have been interesting, and indeed only right, to show that many of the customs and habits which he describes amongst natives of lower civilisation are to be met with under a more advanced form or sometimes only under a different name amongst the nations that believe themselves to be marching at the head of the civilised world. It is not only amongst the Hottentots and African negroes that the habit prevails of inhaling the smoke of narcotic plants through tubes. It is not only amongst the Polynesians and the Redskins of America that the rich keep several wives, while the common people live in monogamy. . . . Perhaps the ethnographical descriptions would have seemed to tend towards satire here, if Dr. Müller had described the *Volkstamm* to which we ourselves belong with the same method as the others; but the philosophic and unprejudiced reader may be trusted to trace many parallels and comparisons of this kind for himself.

H. GAIDOZ.

Dictionnaire Basque-Français. By W. J. Van Eys. (Paris: Maisonneuve. London: Williams & Norgate. 1873.)

BASQUE has long been at once a puzzle and a delight to the philologists. Its isolated position, its strange character, and its unknown origin have given scope for the wildest vagaries of the imagination. The Metropolitan Chapter of Pampeluna two hundred years ago, followed by Éro in the beginning of the present century, found in Basque the language of Paradise; and a short time since M. Baudrimont essayed to prove that the prehistoric annals of mankind could be read in the archives of the Basque Dictionary. But although every now and then we have evidence that the race of linguistic paradoxers, worthy of being immortalised in the Budget of a second De Morgan, is not yet extinct, the language has of late received the attention of serious students trained in all the severity of modern scientific philology. Prince Lucien Bonaparte has rendered invaluable aid to the scholar by his investigations into the several dialects of the country, and we have now at last a complete dictionary of this curious tongue by Mr. Van Eys, the well-known author of the best Basque grammar in existence.

Mr. Van Eys may well regard it as the first contribution to Basque lexicology. Larramendi's lexicon of the Guipuzcoan dialect, hitherto the only available work of the kind, is at once uncritical and inaccurate, and, like other dictionaries of the last century, full of words invented by the writer himself. Besides Larramendi, Pouvreau compiled a lexicon of the Labourdin dialect, which exists at Paris in MS. only; and this with Salaberry's vocabulary of the Bas-Navarrese are the only lexical works which Mr. Van Eys had to refer to. The rest had to be extracted from various Basque books, beginning with Lizarraga's New Testament of 1571. It is a pity that he had no trustworthy

source for the Souletin, which the Basques themselves regard as a peculiarly pure dialect.

The Introduction contains several highly interesting articles; we only wish there were more. One of them disputes the view of Prince Lucien Bonaparte and M. Vinson, that where we have an interchange of *h* with *g* or *k* the guttural is the oldest,—an opinion which, I suppose, they would support on the ground of the general phonetic law that the harder sound passes into the easier, and not the converse. Another article, on the Demonstrative Pronoun, has already appeared in the *Revue de Linguistique*. Some useful notes on the consonants and their interchanges are added.

The Dictionary is at once scientific and practical. The roots, or at least the most primitive forms now attainable, are printed in large type, with the derivatives arranged under them. The varying forms of a word in the four dialects are given, and the origin of terms borrowed from French or Spanish pointed out. Mr. Van Eys occasionally discusses the form and history of a word and the opinions of other writers about it, or illustrates Basque usage from other languages. He has done good service in exposing M. de Charencey's hasty etymologies in the latter's *Recherches sur les Noms des Animaux domestiques chez les Basques*; but he seems to me to have forgotten his usual caution when he regards the root *karraka* as connected with the parent-Aryan *krak*, "to sound:" onomatopoeic words may resemble one another all the world over without implying any mutual relationship.

We trust the Dictionary will attract more scholars to a study of the extremely interesting language which it puts within easy reach of the general reader. Philologically considered, there are few more valuable idioms; and Basque possesses the inestimable advantage of being an agglutinative language a practical acquaintance with which can be acquired without difficulty. We have not to plunge into the snows of Northern Russia or the barbarism of Siberia and Turkey. And the development which Basque has undergone renders it a more fruitful subject of study than most of the other examples of the agglutinative class; while the special problems which it presents are of the highest importance to the advance and elucidation of scientific philology. A. H. SAYCE.

P. Ovidii Nasonis Heroides XIV. Edited by Arthur Palmer, M.A., Fellow of Trinity College, Dublin. (London: Longmans & Co., 1874.)

THIS edition of Ovid's *Heroides* is throughout on a very high level of scholarship and criticism. It is strange that a book so often read in English schools, and which must so often have taxed the patience of the youthful aspirant at any period from the age of eight to fourteen—we read it at the former age ourselves, and found it excruciating—should never have received adequate critical examination in this country till now. Mr. Paley's *Fasti* is a well-known and popular school-book; but this is the only complete work of Ovid's with really good English

notes which has appeared up to this time; for even the *Metamorphoses* still lacks an editor; and the labours of Merkel, Korn, and other Germans, who have done so much to place the text of Ovid on a true footing, have received, as compared with editions of other Latin authors, comparatively little attention.

Mr. Arthur Palmer, who has hitherto been known only as the writer of a clever article on Propertius in the first volume of *Hermathena*, was attracted to the *Heroides* by the advantage which the work possesses of existing in a singularly good uninterpolated MS. of the ninth or tenth century. This MS., the Puteaneus, he considers to be so superior to all the others, of which there are a great many, as to stand in a first class by itself; a judgment which Heinsius seems, partially at least, to sanction, in calling it his *sacra ancora*, though we could wish that Mr. Palmer had done something himself in the way of further inspection of this and the other earliest MSS. to make the assertion incontrovertible. Next to the Puteaneus he ranks Merkel's G, a Wolfenbüttel codex of about the twelfth century; and these two, with an occasional quotation from other codices, constitute the *apparatus criticus* of the edition, which has thus the merit of clearness and much simplicity.

Starting from the Puteaneus as a base worth in its single self many hundred more corrupt foundations, Mr. Palmer has emended several passages of the *Heroides* with a success which, in our judgment, lifts this edition into a book of the first rank. His success is the more considerable that some of his predecessors have failed, or at least failed to convince. Amongst these is Madvig, whose emendations are given in *extenso*, pp. xxxiv.-xl. of the Preface. It need not be said that they are always interesting, as the conjectures of so great a scholar must be, but it is more and more certain that Madvig's strength as an emender is not in verse, but prose; and it must not be concealed that even in the editor of the *de Finibus* such monstrosities as "*Praeceptis Priamei* (voc. of *Priamēis*) *si foret usa tuis*," or "*Quodlibet ad facinus iste dat arma dolor*" are inexcusable. On the other hand, Madvig's *reportat* for *reportas*, vii. 159, *lentifero* for the meaningless *letifero*, ix. 141, like his explanation of the preposition *a* in vi. 156, "*A totidem natis orba sit illa viro*, are highly ingenious, and, at least the last of them, extremely probable. We are paying a deserved compliment to Mr. Palmer when we say that the care which he has shown in constantly keeping before him the two primary rules of conjectural restoration, to adhere to the palaeographical indications of the best MS. or MSS., as the case may be, and to make the author his own standard of ideas, language, and metre, have made us critical in judging not only his predecessors' attempts but his own. He is, in all probability, right in eliciting from the corrupt reading of P ii. 100, *Exspectem pelago vela negateta*, where the other MSS. give *negata meo*, which is nonsense, *vela negante data*, for the short final syllable has several parallels in the *Heroides*, e.g. *vela videre tua*, x. 46. Admirable, too, is *cavet for favet* vi. 100, *Urbe virum iuvi* for *Urbe virum vidi* vi. 55, restorations as certain as restorations can be. Less convincing is

Milite tam forti nauta, tuenda fui vi. 54, for P's *Milite tam fortuna tuenda fuit*. P m sec. and G have *forti vita tuenda fuit*, which Mr. Palmer has printed in his text, though he rightly finds it obscure. It seems possible that Ovid may have meant a contrast in *vita* to the deaths of their husbands by which the Lemnian women had before shown their bravery. "If we were brave enough to kill our husbands, we ought to have been brave enough to defend our lives." There is some weakness in this, but it is an Ovidian weakness, and not worse than his detestable fondness for confusing the material with the metaphorical, e.g. *Quamque lapis sedes tam lapis ipsa fui* x. 50, *Non poterant figi ptaecordia ferrea cornu*: *Ut te non tegeres, pectore tutus eras*. Indeed on the general score of the poetical merits of these poems we cannot agree with Mr. Palmer's verdict, or, to speak more emphatically and more truly, are inclined to think that Ovid's faults are nowhere so conspicuous as here. It is true the very idea of mythical heroines writing love-letters before the invention of writing materials is grotesque; but when this is got over, the execution is full of the most glaring faults of taste. How a man great enough to write the *Amores* could sit down from the perusal of the fourth Aeneid to write *Dido Aeneae* is one of those problems in human nature which only the most enlarged study of the poetic temperament can explain. It is a perpetual shock from first to last, and is only not exquisitely painful because it is so keenly ridiculous.

The commentary is generally good, though hardly full enough; but it is not without faults. In i. 90, *Viscera nostrae tua dilacerantur opes*, which Mr. Palmer translates 'My heart is rent, your wealth is squandered,' it seems more likely that *viscera* is in apposition with *opes*, a favourite trick of Ovid's style, cf. iii. 105, *fortes animas, mea numina*, 149, *nostram tua munera vitam*, vii. 157, *fraternaque tela, sagittas*. In this case *viscera* will be used as in Cic. *ad Q. Frat.* i. 3. 7, *cum de visceribus tuis et filii tui satisfacturus sis*, i.e., as a strong expression to denote the means of subsistence, as we might talk of a man paying away his very life-blood. In i. 103, *Hoc faciunt*, if the reading of P, is probably right, the meaning is not *hoc precantur*, but *precantur* simply, like *ροῦρο δρῶσι*. In vii. 146, ix. 61, it is not difficult to trace the usual half-ironical sense of *nempe*, "to be sure": can it be shown that it is ever without this notion, however latent and untranslatable it may be? In viii. 19, *Si (sit) socer exemplo nuptae repetitor ademptae, Nupta foret Paridi mater, ut ante fuit*, it is a violation of all probability to take *exemplo* as "after your fashion"; the sense seems to be, "if you look at home for examples, Menelaus would still be without his ravished wife, if he had acted like you." In ix. 101, *Quod tu non esses iure*, the subjunctive is strictly exact, "what you would have no right to call yourself," not, as Mr. Palmer translates, "That which you were not by right."

The book is, however, throughout careful and good. We hope to see another work of Latin philology from its editor.

R. ELLIS.

NOTES AND NEWS.

We understand that the *Micrographic Dictionary* is now undergoing a complete revision by its present editor, Professor P. M. Duncan, F.R.S., and that the first part of this new edition will be published shortly by Mr. Van Nostrand.

MR. GEORGE DINES has printed a large map of the rainfall of the London district from 1813 to 1872, which shows that the yearly average over the whole district during sixty years has been about 24½ inches. The day of least rainfall has been March 24, the day of greatest fall October 22. Taking five days in succession, the least rainfall has been from March 22 to 26; the greatest from October 22 to 26, both inclusive. This map does not corroborate Mr. Meldrum's theory of the connexion between the sun-spots and the rainfall.

IN our notice of the last report of the Royal Commission on Scientific Instruction, &c., we pointed out the important services rendered by Kew Gardens to our colonies and dependencies in supplying them with living plants, with seeds, and with trained gardeners. An interesting confirmation of this is to be found in Governor Grant's recently transmitted account of the Botanic Gardens at Castleton, Jamaica. We have space but for two extracts:—

"The Vanilla thrives very well at Castleton, and the flowers are artificially fertilised, with complete success, by the new gardener, Mr. Kendall, selected for us by Dr. Hooker, whose services in all respects have been most valuable."

Further on we read,—

"For a few years past the Superintendent of our Botanic Garden has been distributing here small packets of tobacco seeds, at the rate of two hundred packets a year. These packets contain five varieties of seed, originally procured from Kew. I cannot mention Kew without observing that, infinite as have been the services of Dr. Hooker to every part of the British Empire, there is no spot in that empire which has greater reason for gratitude to that eminent man than this island of Jamaica."

Solar Photography.—Mr. De la Rue, to whom astronomers are indebted for the introduction of photography in celestial affairs, exhibited at the last meeting of the Astronomical Society an ingenious contrivance for taking on different parts of the same plate sixty photographs in succession of the planet Venus with the neighbouring part of the sun's limb at intervals of one second, on the occasion of the approaching transit of Venus, an idea due to M. Janssen. With this object a circular glass plate, eleven inches in diameter, duly sensitized, is moved step by step every second, whilst a brass disc with a narrow slit revolves in front of it once in a second, the exposure, amounting to a few thousandths of a second, being given when the slit passes across a rectangular aperture which determines the size of each picture, successive portions of the plate being brought in front of this opening every second. The motion is given by clockwork, and the whole apparatus is to be attached to the photoheliograph now being constructed by Mr. Dallmeyer for the Indian Transit of Venus expedition, under command of Colonel Tennant, R.E. Another plan with the same object in view has been devised at Greenwich, to be applied to the five photoheliographs for the British expeditions, and has already been brought into operation. With this arrangement fifty pictures of the sun's limb have been taken in as many seconds, and without any indication of tremor, the great difficulty in the practical application of Janssen's idea; for though the exposure is so short, yet a vibration may have time to produce an injurious effect even in a hundredth of a second. The great test of the smoothness of the working of this apparatus is that there is no audible sound during the turning of the handle which gives motion to the whole, though the operators have hardly yet acquired the skill of an organ-grinder in keeping good time.

The Distance of the Sun.—Not content with equipping a costly expedition to the Mauritius for the Transit of Venus, Lord Lindsay seems determined to leave no stone unturned which is likely to help in obtaining accurately the sun's distance. Accordingly he has, in an elaborate paper, discussed the value of observations with a heliometer of the distance of the planet Juno from neighbouring stars; for though this small body does not come so near us as Venus or Mars, yet it can be more accurately observed on account of its smallness, and as the rotation of the earth shifts the position of the observer and so produces a parallactic displacement of the planet among the stars between rising and setting, there is no necessity to move outside the observatory, or to compare measures at different places in order to find the parallax and distance of the planet and hence the distance of the sun. Lord Lindsay considers that, by making the most of the measures which may be obtained next November, when Juno is near the earth, the distance of the sun may be found within one four-hundredth part, or about eight hundred thousand miles, a small error comparatively speaking. The heliometer which is to be used in these measures is a telescope with an object-glass cut in two, each half of which forms an image of the object, so that, by separating the two halves to the proper amount, the image of Juno from one half may be made to coincide with the image of a star from the other half; the reading of the scale will then give the separation of the two halves of the object-glass, and therefore the distance between the star and Juno, and as a preliminary to the observations, Lord Lindsay has carefully determined the value of the scale divisions on which everything depends. Of course the length of the scale will vary with the temperature, but it appears that the focal length of the object-glass varies in nearly the same proportion, so that the angle measured, which is the length of the scale divided by the focal length of the object-glass, remains nearly unaffected by change of temperature.

Twinkling of the Stars.—The subject of the twinkling of stars has engaged a good deal of attention of late years, and some interesting results have been obtained. A few years ago, the Italian astronomer, Respighi, announced the discovery of the cause of scintillation in certain dark bands which were seen to traverse the spectrum of a star, indicating changes in the refrangibility of our atmosphere, from hot and cold strata, which produce something of the effect of a passing mirage. A layer of hot air would bend the rays less than the colder and denser air around, and thus the star's light would not reach the observer, rays which traversed the hot stratum passing over his head, and those which traversed the cold air below being bent so as to fall beneath his feet. As the rays of different colours are differently bent in their passage through the air (the red rays being the least refracted), different parts of a star's spectrum would be thus cut off in succession, as the relative temperatures of the layers of air varied. Arago's not very lucid explanation of the phenomena, as a result of the interference of light, is in this way completely disposed of.

M. Montigny, of Brussels, has been investigating the amount of scintillation in different stars by the help of an ingenious contrivance, to which he gives the name of scintillometer. His plan is to make use of the persistence of impressions on the retina, by causing a thick plate of glass, mounted obliquely on an axis parallel to that of the telescope used, and fixed just in front of the eyepiece, to rotate rapidly; the effect of this is to displace the star's image, so that, owing to the varying inclination of the glass plate, the star appears to move in a circle, which, if the rotation is rapid enough (three or four times in a second), forms a continuous circle of light, just as in the case of a burning stick whirled rapidly. The changes in the colour of a star will be seen on this circle, the successive points of which give the

appearance of the object at successive small fractions of a second; and in this way, by counting the alternations of colour in the circumference of this circle of light, M. Montigny has succeeded in observing nearly two hundred alternations of colour in a second of time.

The point sought to be established was the connexion between these changes and the constitution of the stellar light, for it is easy to see that rays which are deficient cannot be acted on by undulations of the atmosphere, and that there will therefore be fewer changes of colour the more dark bands there are in a star's spectrum. Now Secchi has divided the stars of which he has examined the spectra into four types, and M. Montigny has observed the scintillations of stars belonging to three of these types: viz., bluish white stars, exhibiting four black lines in their spectrum; yellow stars, like our sun, showing numerous fine dark lines; and orange stars, which have a spectrum somewhat resembling a colonnade. As far as the results obtained by M. Montigny go, it seems that the greatest amount of twinkling is to be found in the first type (white stars), and the least in the third type (orange stars), and that the mere brightness of the star has no influence on the phenomena. But the principle of combining observations of different nights without any further correction, on which M. Montigny has acted, is highly objectionable, and destroys our confidence in his conclusions. The proper way of treating such measures is to arrange the stars in sequences representing the order of scintillation, just as Sir John Herschel formed sequences of brightness as a basis for his standard magnitudes of stars.

Polarisation of the Light of the Sky.—When light is reflected from any surface, it suffers to a greater or less extent a modification known as polarisation, by virtue of which it is rendered incapable of reflection from a plate of glass, or of transmission through certain crystals in certain positions. We thus have a ready means of knowing whether a body is self-luminous, or shines by reflected light. But the polarisation of the sunlight reflected by the sky often masks other effects, and Professor Pickering has done good service by taking up this subject, which he does in a paper in *Silliman's Journal*. The first part of the paper is devoted to an experimental verification of Fresnel's formulae for the intensity of the light reflected or transmitted by glass plates. The curious result is arrived at, that with ten plates of glass more light is transmitted obliquely than normally.

The polarisation of the sky is found by Professor Pickering to be the same at points equidistant from the sun, and to follow nearly the law which would be given by specular reflection from particles of aqueous vapour, but diminished in amount 30 per cent.

By means of the polarimeter Professor Pickering has separated the polarised light (which is nothing but reflected sunlight) from the light which has been absorbed by the particles of the air and then emitted, and which, therefore, partakes of their colour; the interesting result of these experiments is that the blue of the sky is really inherent in it, and is due to the colour of the particles, a view quite in accordance with the observations of Professor Cooke with the spectroscope, and Professor Tyndall on aqueous vapour in a state of formation.

Solar Corona.—Mr. Ranyard has pointed out some curious features in the solar corona, as depicted in the photographs taken during the total eclipse of 1871, and has suggested the possibility of their being due to a comet, as a nucleus with three concentric rings is visible. Like a good picture, the more these photographs are looked at the more detail is seen, and the structure exhibited in the corona after patient gazing is quite marvellous. Under Mr. Ranyard's care, faithful drawings have been made which represent with wonderful accuracy the principal detail, but though the sun's diameter is only two-tenths of an inch

in the photographs and is four inches in the drawings, it is hopeless to attempt to insert everything that can be made out on the negative.

The drawings will appear in the exhaustive report on Solar Eclipses, to be published in the *Memoirs of the Astronomical Society*, under the superintendence of the Astronomer Royal and Mr. Ranyard.

Changes in a Nebula.—The nebula surrounding the southern star η Argus has at last been caught in the act of changing. Mr. Ellery writes from the Melbourne Observatory to say that its appearance is quite different from what it was six months ago, and that it is closing rapidly on the central star which is situated in an open space, something like a figure of eight. It has long been known that the star is subject to wonderful variations of brightness, but the changes in the nebula appear more marvellous still. Possibly, we are witnessing the birth of a new solar system. The decision of this question, which has been for some time a matter of dispute, must be most gratifying to those who urged the equipment of the magnificent Melbourne reflector of four feet aperture, and who devoted so much time and trouble to its construction.

THE German papers announce that the iron observatories, which have been constructed by order of the Imperial Government for the observation of the Transit of Venus, are now being exhibited to the public at Stuttgart. The structures, which have excited great notice from their singular appearance, consist, in addition to the main building, of what may be described as turrets on wheels, provided with moveable and revolving cupolas. The roof has an opening which may be closed at will, and is also provided with a canvas cover to protect it against sun or rain, while the main passage of the building, which is appropriated to the instruments, is admirably adapted to the purpose, and thoroughly secured from all avoidable risks of atmospheric influences. Several of these portable observatories have already been forwarded to Berlin, and the director of the Observatory at Strassburg is daily expected at Stuttgart to superintend the removal of the remainder.

WE have received the "Reports of the Mining Surveyors and Registrars" for the Colony of Victoria, for the last quarter of 1873, which contains some statistics of interest. The total number of gold miners in the colony was 50,595, of whom 11,388 were in the Ballarat district, and 10,364 in the Maryborough district. 362 steam-engines, with an aggregate horse-power of 9,579, were employed. The price of gold was highest in the Ballarat and Maryborough districts; in the central division of the former it was from 4*l.* 1*s.* 6*d.* to 4*l.* 2*s.* 9*d.* per ounce. The deepest shaft in Victoria seems to be in the Pleasant Creek division of Ararat; it was 1,305 feet deep, and "still sinking," but the largest mine is Clunes, in Ballarat, the shaft being 1,012 feet, the deepest level 1,005 feet, and the deepest cross-cut 1,005 feet in depth. The average yield of gold from the quartz crushed varied greatly; at a mine in Gippsland it was as high as fourteen ounces per ton, but in the majority of cases was below one ounce. The total yield of gold for the quarter is given at 297,576 oz. 15 dwt., of which 124,474 oz. 8 dwt. were got from alluviums, and the remainder from quartz reefs. The quantity of gold, the produce of the colony, exported was 267,579 oz. 6 dwt. The gross weight of rough gold received at the Royal Mint was 12,252-32 oz., and of gold bullion, 45,558-32 oz.; while the gross weight of coin issued was 76,277-01 oz., and of gold bullion 684-645 oz. The report also gives details of the quantity of gold obtained from quartz, quartz tailings, and mullock, washdirt and cement.

The accounts from the goldfields vary, but on the whole the quarter seems to have been a dull one. In the Bunyong division a nugget weighing 101 oz. 6 dwt. was found, and in the Hepburn

division one of almost pure gold of 57½ oz. Strikes are not unknown. What a gain it would be if only our compilers of blue-books would take example by one of the surveyors, who reports: "I have nothing worth reporting about my division for the past quarter," though we are bound to add that he does devote a little over a line to one other fact. Baron Müller continues his description of new vegetable fossils of Victoria, dealing with *Pentane Clarkii*, *brachyclinis*, and *trachyclinis*.

MR. JAMES A. H. MURRAY has received from the University of Edinburgh the honorary degree of Doctor of Laws, in honour of the contributions to the language, ethnology, and early history of Scotland contained in his *Dialects of the Southern Counties of Scotland*, and other philological works, which have made his name known to the linguistic world not only of England, but of France, Germany, and America. The honour was at the same time conferred upon Dr. Reinhold Pauli, of Göttingen, one of the first students of English History in Germany.

DR. A. BRUNING, the young pastor of the Dutch Reformed Church, whose essay on the Vedānta philosophy was noticed in the ACADEMY shortly after its appearance, and who has since been devoting his leisure time to the study of this system, has just published the first portion (30 pp.) of a translation of 'Sankara Āchārya's commentary on the Brahma Sūtras (the aphorisms in which the principles of that doctrine are concisely indicated) in his native tongue, which has been printed in the Transactions of the Society for promoting an Acquaintance with the Peoples, Languages and Literatures of Netherlandish India. This translation Dr. Bruining proposes to continue; and if a judgment may be formed from the essay above referred to, his present undertaking promises to furnish an important contribution to our knowledge of Hindu philosophy—a department of Indian literature on which German Indianists have as yet published comparatively little. The English translation of the Brahma Sūtras by the Rev. K. M. Banerjee, of Calcutta, of which the first fasciculus (96 pp.) appeared in 1870, does not seem as yet to have proceeded further.

ACCORDING to Dr. Mommsen's last report, laid before the Berlin Academy, February 5, 1874, the present state of the *Corpus Inscriptionum* is as follows:—

Dr. Henzen has carried on the printing of the *urbanae* (vol. vi.) from p. 329 to 376. This finishes the inscriptions of the magistrates, except a portion of those after Diocletian.

The separate publication of the *Acta* of the Arvales, with commentary by Dr. Henzen, is finished.

Dr. Zangemeister has undertaken the graffiti inscriptions of Rome, and made arrangements for collecting the stamps found on Roman tiles.

Dr. Mommsen himself has finished vol. iii. (East and Danubian Provinces), which is published.

The printing of vol. v. (Upper Italy) has proceeded from p. 617 to 744, and its publication may be expected in 1875.

Preparations for the South Italian Inscriptions, carried on by Mommsen, have so far advanced that the printing will begin in 1874.

Dr. Hübner has finished his part (vol. vii.), embracing the inscriptions found in England.

The inscriptions of Gaul and Germany have been entrusted to Dr. Hirschfeld of Prague.

Dr. Bormann is engaged at present in collecting and collating the inscriptions of Central Italy, while those of Africa have been assigned to Dr. Wilmanns.

THOSE who are interested in the scientific study of the races of man will, says the *Nation*, be glad to know that the new Ethnological Society of New York is giving evidence of considerable vitality and capacity for scientific work. At the monthly meeting, held on March 24, a carefully studied paper was read by Professor Philip Valen-

tin on "The Mexican Hieroglyphic for the Sun." Professor Valentini took for his starting-point the famous "Aztec Calendar," a huge sculptural stone exhumed in the great square of the city of Mexico, in December, 1790, representations of which may be found in the large illustrated works on Mexican antiquities. In fact, his paper was devoted to a detailed description of this stone, and an investigation of the probable meaning of its elaborate hieroglyphic symbols. The sculptured face, which occupies the centre, was examined in detail, special attention being given to the long projecting tongue, which, however, in the opinion of the author of the paper, is not a tongue, but a huge and awkward ornament inserted in the lower lip. The four cartouches and the other hieroglyphic symbols immediately surrounding the face were also examined, and the conclusion was reached, after a somewhat precarious course of reasoning, that the stone was not simply a calendar, marking, as Gama long ago ventured to suggest, the time of the summer and winter solstices, but an astronomical history, depicting, by symbols well understood in ancient Mexico, the successive destructions of the earth by the sun, as recorded in the Mexican mythology. At different points in the course of his enquiry, Professor Valentini attempted to establish a connexion between the hieroglyphics and picture-writings of Mexico, and the peculiar inscriptions found in such abundance upon the ancient monuments of Central America. These inscriptions have hitherto been looked upon as entirely distinct from those of Mexico, and are considered by the best modern investigators as possessing a syllabo-phonetic character, and, therefore, as offering a specially attractive field for some modern Champollion. There are a few enthusiasts quietly at work at the task of deciphering them. Should Professor Valentini's hypothesis be adopted, their occupation would not indeed be quite gone, but it would take on a different form, and become much less fascinating than it has been.

M. JULIEN VINSON, of Bayonne, is preparing a complete bibliography of works relating to the Basque language and history. There is already a work of the kind by M. Francisque-Michel, prefixed to his edition of the *Proverbes of Oihenart*; but the researches of M. Vinson are expected to bring to light much additional matter. Many old Basque books are very rare; at the sale of M. Burgaud de Maret's library several fetched high prices: *Kalendera Bazia noiz daten*, Rochellan, P. Hautin, 1571 (a unique copy, containing a Protestant liturgy), 900 fr.; a translation of the *Imitatio* (Third Book only), by Arambilague, Bayonne, 1684, 220 fr.; *Gueroco guero ecto*, Bordeaux, G. Millange, 1643, 420 fr. (one of two copies known of a book of devotion by Pierre d'Axular, curé at Sarre); the *Imitatio*, translated by Chourio, Bordeaux, 1620, 100 fr.

THE *Numismatic Chronicle* (vol. xiii. part 4) contains the completion of Mr. B. V. Head's paper on the "Greek Autonomous Coins of the Wigan Collection selected by the British Museum," with notes on the more remarkable, and an interesting letter from M. Six, of Amsterdam, on certain difficult pieces described in the first part of the same article. The latter suggests to class tentatively the remarkable incuse coin No. 24, with the inscription *ser*, to the unknown city which was succeeded by the Apulian Neapolis, and also offers a theory for classing the difficult coins of the Kings of Pergamus. M. Sauvaire, of Alexandria, contributes a letter on an inedited *dīnār* of Sālih ibn Mirdās of Aleppo, the first known coin of the Mirdāsids. The historical *résumé* accompanying the description is of no little value, and M. Sauvaire has adopted the admirable plan of adding a full genealogical table of the dynasty. Mr. Stanley Lane Poole concludes his treatise on the Coins of the Urtuk princes of Syria and Mesopotamia, whose coinage is remarkable for the adoption of Byzantine images combined with Arabic inscriptions. The article is

chiefly occupied with a detailed catalogue of the coins of these princes; but at the end, under the somewhat fanciful heading of "Metalegomena," the writer has appended some critical notes on various contested points connected with the subject. One of these notes dissipates the widespread numismatic error as to the orthography of the name of the Abbāsī Khalīfah, En-Nāsir; another slightly touches on the history of the double-headed eagle. At the end of this part there is the usual annual report of the Council of the Numismatic Society, from which it appears that the number of the members of the society has increased to 185. The report includes obituary notices of General Fox, Mr. Edwin Norris, Mr. Bergue, and Sir G. Musgrove.

MEETINGS OF SOCIETIES.

PHILOLOGICAL SOCIETY (April 17).

MR. H. SWEET read his second paper on the "History of English Sounds," in which he treated of the vowel-changes of the Transition (Semi-Saxon) and Middle period.

In orthography the introduction of French spellings to indicate English sounds was noticed, and the causes explained; the general result of the examination of Middle English orthography was to confirm Mr. Ellis's view that the mediæval scribes wrote phonetically, not traditionally, as is the case now.

Mr. Sweet then passed on to the consideration of the peculiar "levelling" of sounds in the Transition period, one result of which is the loss of the Old English modifications of *a*, namely *æ* and *ea*, both of which return to the original sound, so that Old English *nama*, *glæd*, *heard*, are all levelled under the one vowel *a*: *name*, *glad*, *hard*. These returns to an older and stronger sound are quite inexplicable, if considered as ordinary "organic" sound-changes. The explanation given by Mr. Sweet was that the key to the whole change must be sought in the well-known alternation of *æ* and *a* in such words as *daeg*, *dagas*, which, in accordance with the levelling tendencies (especially noticeable in the inflections) of the Transition English, came to be regarded as purely superfluous discriminations. The indistinct *æ*—so liable to be confounded with *e*—was therefore discarded, and the clear *a* made the sole representative of its class.

The general laws were then stated on which depend the remarkable qualitative divergence of long and short vowels in the modern Teutonic languages. If it can be shown that all these languages follow the same general laws, it is but reasonable to suppose that the same laws will be found valid in the case of Middle English also; especially when we consider that the thirteenth century English was as much in advance of its contemporaries as Modern English is of its, and that Middle English is practically on a level with Dutch and the other living Teutonic languages. It can be shown that processes which were in active operation in Transition English are still going on in Dutch and the other languages. Mr. Sweet summed up the general results of his investigation thus: "Long vowels contract both the pharyngeal and the oral passage as much as possible, the former by 'narrowing,' the latter by raising the tongue, and contracting the lips (as when *oo* becomes *uu*, and *aa* becomes broad *oo*). Short vowels pursue the very opposite course: their tendency is towards 'widening,' and lowering of the tongue, nor are they diphthongized, as long vowels are."

These general principles were then applied to the investigation of the distinction between close and open *ee* and *oo* in Middle English. Mr. Sweet came to the conclusion, opposed to Mr. Ellis's, that distinctions did exist which were shown to correspond to distinctions both in Old and Modern English. The following table gives a general idea

of the result as far as the *oos* are concerned (*ôô* = close, *òò* = open *oo*).

Old English.	Middle English.	Modern English.
tóó	tóó	tun (<i>too</i>)
taa	tòò	tóó (<i>toe</i>)
hól (short)	hòl hòl	hóol (<i>hole</i>)

The Old English close *ôô* was kept unaltered in Middle English, while *aa* was labialized to the broad *òò* (as in *law*), and the short *ô* of *hol* was first lowered, and then lengthened, giving the broad *òò*, thus becoming identical with the preceding *òò* from *aa*. In Modern English, the two *oos* were, in accordance with the regular tendencies of long vowels, raised each a step, *ôô* to the *uu*—and *òò* to the *ôô*—position.

NEW SHAKSPEARE SOCIETY (April 19).

ON Friday, April 19, was read (Mr. Tom Taylor in the Chair) Mr. Fleay's third paper on "The Authorship of the *Taming of the Shrew*." There was little new in the results attained, or supposed to be attained, by the writer of this essay; in fact, he seemed rather to aim at showing that his metric tests led to the same results as criticism from other points of view, than at any particular novelty in his conclusions. The train of argument was threefold: first, that the play abounded in lines metrically deficient, monosyllabic measures, and doggerel of a different kind from that used by Shakspeare in *Love's Labour's Lost*, the *Comedy of Errors*, &c.; secondly, that the classical allusions and Latin quotations were such as are found in plays of the Marlow school, but not in Shakspeare's undoubted plays; thirdly, that there are 130 words in the play not used in any certainly authentic drama of the great bard,* twenty of which do occur in *Henry VI.* and *Titus Andronicus*. He said: "Shakspeare uses in his undoubted plays about 14,000 words; the *Taming of the Shrew* is about one-fortieth in length of his complete works; if each of his plays had as many words peculiar to itself as this one, more than one-fourth of his whole vocabulary would consist of words that occur in one play only."

Thus far Mr. Fleay seemed to attack the genuineness of the entire play; but he showed from the lists and tables which he gave that there were portions (viz. the last scenes of Acts iv. and v., and bits of Act iv. sc. 3, Act ii. sc. 1) to which none of his remarks were applicable; these parts being entirely free from the phenomena adduced as to the other parts. He concluded, therefore, that the only parts touched by Shakspeare were the characters of Katherine and Petruchio; † that the play had been written by another poet of the theatre, but his *dénouement* proving unsatisfactory, Shakspeare had been employed to alter it: that this explained the leaving Sly undisposed of at the end of the play, and other minor matters. He also agreed with Mr. Collier as to the date of the production of the piece, viz., in 1600–1601, and confirmed this by the allusion to Heywood's *Woman Killed with Kindness*, and the proportion of rhymes, &c., given by the metrical tests.

He gave also a similar list to the one above mentioned, of words occurring in *Titus Andronicus*, but not in the undoubted plays.* In discriminating plays of the Marlow type, Mr. Fleay seems to set a high value on this argument; perhaps he overrates it on the ground of the trouble it has cost him to get at his data; in order to form these lists for the plays named above and the three parts of *Henry VI.*, he has had to read Mrs. Clarke's

* At the meeting many of these words were shown to be used in Shakspeare's Poems, or in the Shakspeare part of the *Shrew* and other doubtful plays.

† At the meeting it was contended that the revised Induction, and the scene with Grumio and his fellow-servants, were also Shakspeare's.

Concordance from beginning to end, a work of some labour if not of utility.

Mr. Fleay's papers on *Timon of Athens* and *Pericles*, in which the criticism is of an entirely different cast, and which we understand he values much more highly for the sake of their results, were distributed to the members. The conclusions arrived at in these papers can be subjected to the most searching tests, as Mr. Fleay has not shrunk from printing separately the parts which he assigns to Shakspeare.

VICTORIA INSTITUTE (April 20).

AT the meeting last Monday evening, April 20, of the Victoria Institute, Mr. Edmund W. Gosse, of the British Museum, read a very thoughtful and carefully-prepared paper on "The Ethical Condition of the Early Scandinavian Peoples." After having drawn the attention of his hearers to the special forms of culture which Christianity superseded in Greece and Rome, and to the low moral condition of the Southern nations, from which it was the mission of the Christian teacher to raise them, Mr. Gosse proceeded to show how far the early ethical codes of the Scandinavian peoples had rendered those races more or less amenable to the discipline of the new faith.

As might be expected from a writer who is at once an accomplished Northern scholar and a graceful lyrist, Mr. Gosse derived his materials and illustrated his theme directly from the Older Edda, that most precious depository of all we know of the religion, literature, history, and social life of the race with which we are proud to claim kindred. The author drew a rapid but vivid sketch of Northern cosmogony, and of the special psychical characteristics which so favourably distinguish Scandinavian mythology from all other forms of pagan belief. In this part of his lecture he showed how the Odinic religion, without detriment to its individuality, seemed to combine with its own stern and solemn force something of the graceful loveliness of Hellenic mythology, and not a little of the unchangeable, calm, and meditative spirit of the Buddhist's faith. But there was one point, he said, at which the religion of the Scandinavians stood alone, and had no connecting links with other pagan theologies, and that was, in the idea of an active holiness, a stainless spiritual purity personated in the minds of the people by their god Heimdal, the one immaculate son of Odin, whose serene purity no passion-stirred emotion could dim or ruffle, and whose mission amongst his brother Aesir it was to watch the worlds above and below them until the end of all things that are, when from his unsullied lips the blast will resound that is to summon gods and men to a final judgment, after which evil will be annihilated, holiness will reign supreme, a new and beautiful world will arise, the good Aesir will survive in renewed strength and beauty, and the One All-Father will rule the universe alone and supreme in beneficent wisdom and perpetual peace.

Mr. Gosse very justly pointed to the general character of the Northman's conception of an All-Father, of a final judgment, and of the readjustment of the balance between good and evil, as proofs of the superiority of the Northern race, morally and spiritually, over other pagan peoples. But we think his own poetic appreciation of the beauty of the myth of Heimdal may have led him unconsciously to clothe the Northern idea of goodness and purity with something more of spotless brightness than the mythic elements of the Saga warrant us in claiming for it. There can, however, be no question of the generally pure and elevated tone of the Odinic religion, and Mr. Gosse imparted special interest to his subject by the ability with which he considered the practical bearings of that faith on the lives of the people, while he followed, with fairness and clearness, some of the special directions in which their religious and moral conceptions succeeded or failed in making themselves felt in their motives and actions.

ASIATIC SOCIETY (April 20).

JAMES FERGUSON, Esq., F.R.S., D.C.L., V.P., in the Chair. Mr. T. W. Rhys Davids read a paper on the "Place of Ceylon in Historical and Archaeological Research," maintaining that the importance of Ceylon was not that of a strong military power, but depended rather on the light which its different remains, literary and archaeological, threw on the history of civilisation in the adjoining continent of India. In India itself, Professor Wilson had long ago pointed out the absence of any real historical works, whereas in Ceylon there was a continuous history from B.C. 161 downwards, written in both Sinhalese and Pali, and confirmed by existing inscriptions and archaeological remains. From these historical works much valuable information might be gleaned concerning the more important history of India, especially during three periods: 1. From the time of Buddha to that of Asoka the Great, circa 500 B.C.–240 B.C. 2. From the time when the Buddhists were overcome in Kalinga to the time when Buddhaghosha went to Burma, circa 300 A.D.–500 A.D. 3. During and immediately after the time of Parākrama the Great, circa 1150–1250 A.D. Attempts had lately been made to throw doubts on all ancient Sinhalese history because of certain discrepancies in the Mahāvamsa, but these discrepancies could not rightly be considered fatal to the whole work, which, especially by comparison with other records, would yield important results to criticism. The Mahāvamsa date for the death of Buddha had, it was true, been almost universally condemned; but in the older Diparansa was found a different chronology, which, by calculations based on the theraparamparā, or succession of chiefs of the Winaya (Buddhist patriarchs), placed the date of the death of Buddha at about 400 B.C., and not 543 B.C., the date derived from the Mahāvamsa.

The historical works of Ceylon were mostly written in the second period above referred to, when as in the sixteenth century in Europe a literary and religious reformation reacted upon and strengthened each other; but those of the third period were also very important, from the great fulness of detail with which they recorded the history of a comparatively short time. So abiding were Oriental customs, and so very little did we know of ancient civilisation, that a full description of the state of society in the twelfth century in Ceylon could not fail to throw much light on the antiquities of India. The importance in this respect of Mr. Kumāra Swāmi's just published edition of the Dāthāvamsa, a Pali historical work of this period, based on the much older Daladāvamsa in Sinhalese, was pointed out. After a slight sketch of some of the principal ruins, and of the inscriptions of Ceylon, a sketch which would have been ampler but for want of illustrative drawings, it was finally urged that, though this claim had been lately disputed, yet it was chiefly to the Ceylon records that we must look for any clear understanding of Buddhism, the most important movement save Christianity in the history of mankind; and, as a proof of the great interest of the results which might be expected from a study of the religious books of Ceylon, some very curious coincidences between the doctrines of the Essenes and those of Buddhism, were pointed out.

A discussion ensued, in which Mr. Kumāra Swāmi, Dr. Leitner, the chairman, and others took part.

LONDON ANTHROPOLOGICAL SOCIETY.

At a meeting of this Society at 37 Arundel Street, Strand, on the 21st inst., Dr. Charnock, F.S.A., President, in the Chair, the paper read was "On Hybridism," by Mr. Serjeant Cox. The paper discussed the various theories of the production of mixed races of men and animals. Adopting the "germ theory," as developed by the elder physiologists, the author endeavoured to prove that two germs contribute to the peculiar qualities of the hybrid.

ROYAL SOCIETY OF LITERATURE (Wednesday, April 22).

A PAPER, by Dr. Birdwood, was read on a Greek silver-gilt patera, belonging to the India Office Library, found in Badakhán by the late Dr. Lord when attached to the late Sir Alexander Burne's Mission to Cabool. It had long lain forgotten in the strong box of the Library, and when Professor Childers, with Dr. Birdwood, first came upon it, they thought, in the absence of all record of it, that a real discovery had been made. But the patera, it was found, had already been described and figured by Prinsep in vol. vii. of the *Asiatic Society's Transactions of Bengal*; and it is mentioned also, and badly figured, in Burne's *Cabool*. It represents the triumph of Dionysos. Its style is debased Graeco-Roman. The treatment of the figures, and more particularly of the drapery, recalls the later Roman and Byzantine ivories, and it is possibly of Eastern workmanship of the latter part of the fourth century. Its weight is 29 oz. 5 dwt. Troy; its diameter 9 inches; its depth $1\frac{1}{2}$ inch; and its thickness from $\frac{1}{8}$ to $\frac{1}{16}$ and $\frac{1}{20}$ of an inch. . . . It was Mr. Thomas who saved this patera on a memorable occasion from the melting-pot.

DEATH OF PROFESSOR PHILLIPS.

WE have just received by telegram from Oxford the melancholy intelligence of the death of Professor Phillips, the geologist and keeper of the University Museum. It appears that on Thursday night he met with a serious accident at All Souls College, by falling down stairs and fracturing his skull. He never recovered consciousness, and died yesterday at 1.30 p.m.

FINE ART.

Modern Gothic Architecture. By T. G. Jackson, Architect. (London: Henry S. King & Co.)

Modern Parish Churches: their Plan, Design, and Furniture. By J. T. Micklethwaite, Architect. (London: Henry S. King & Co.)

WE have placed these works together at the head of this article, notwithstanding a very considerable divergence between them in quality, style, and material, since each represents an important and characteristic phase of contemporary thought upon questions of architectural practice.

Mr. Jackson's work is a pleasant oasis in the arid tract of architectural literature, and has all the advantages which a wide and cultivated view of his subject, a pleasant style and unblemished good taste in the treatment of matters too generally disfigured by vulgar polemics, can bestow on it. His modest admission "that there is little in the work which has not at some time or other passed through the minds of thoughtful students of architecture," may perhaps be accepted, but not as in any great degree detracting from its value. Those who have given exceptional study to the subject will be glad to see their own views expressed in a perfectly readable form, with all the original colour given to old matter by the influence of another mind, and with novel illustrations of very considerable value; and those to whom such discussions are less familiar will find in his work a ready and easy admission into the heart of the question as it is at present conceived.

Mr. Jackson's argument is briefly as follows. The Gothic revival may be said on the whole to have failed in obtaining the results which its advocates anticipated for it, and this is so generally admitted that it is time to enquire into the causes of the failure. Not but that the style is the right one for us who have no living style amongst us to have chosen, but the spirit in which we have studied it is at fault, and we have failed, for various reasons, to put it to the best use. The first cause of failure is that we have mistaken the letter for the spirit, have run into excess in the direction of "formalism and purism," and have failed to appreciate the elasticity and capability of the style when assimilated with cultivated intelligence. Again, an important obstacle to the success of the style has been the vanity and self-assertion of practical architects, who have assumed the necessity to be original and striking at all risks, have preferred vulgarity, eccentricity, and sensationalism to the least suspicion of tameness, and who, by their restless and uneasy self-assertion, have induced the degradation of the style which is almost universally apparent. Another stumbling-block in the progress of Gothic is, in Mr. Jackson's opinion, the idea which is current of the exclusively ecclesiastical character of mediaeval architecture, and its inapplicability to modern domestic uses. He conclusively shows that no such duality of function can be traced in the Gothic of the past, nor is it essentially inherent in the style, of which the full elasticity must be adequately recognised by those who would use it to the best purpose. Its elasticity in this respect is to be limited neither by special period, nor even by received terminology; but as Gothic architecture is to be taken in the wide and catholic sense of "the practice of architecture in Great Britain according to true and natural principles," we are by no means to put aside methods of architectural treatment which are usually placed in the category of the Renaissance. There is practically to be no limit to our catholicity in the selection of models, so long as the essential principle of Gothic treatment be established in our minds. Finally, not only are we to study one style in the light of universal architecture, but architecture itself is to be treated in the spirit of universal art. The architect is to be at least the organiser, if not the inventor of an artistic result, to which painting and sculpture are to contribute in no less degree than architecture itself, and in which they are not less rigorously controlled to an harmonious result.

Such is a very brief and inadequate expression of the view which Mr. Jackson takes of our present position and prospects, and which we are content to accept generally, reserving for the present some few points of divergence.

Mr. Micklethwaite's work is a series of practical essays upon details of ecclesiastical design, each of which is discussed in its relation to that form of modern worship which avails itself most of the assistance of good art. The writer, though differing, and expressing perhaps *ad nauseam* his differences, with the "correct" style of church

architecture, nowhere expresses any consciousness that any question may be raised as to the general features of the present condition and tendencies of ecclesiastical art, which are assumed to be exclusively of the ceremonial kind. So rooted is his conviction that things will still go in this direction, that he advocates the immediate introduction of certain implements of mediaeval worship which are not at present used, anticipating that they must shortly be required. The theory of this work, therefore, is rather implied than expressed, and we are content to recognise it as another phase of the best architectural thought and practice of our day—its apparent collision with the other work being the principal characteristic for which we have elected to notice it.

But we may observe in passing that it is pre-eminently desirable that in the discussion or proposition of architectural ideas, a moderate and tolerant tone should be preserved. The public are by this time fully, much too fully, alive to the fact that in the profession of architecture each style is the rival and antagonist of every other, and the catholicity which Mr. Jackson advocates in the practice of the art is no less needed in its discussion. Nor indeed has he done less in the latter direction by example than in the former by precept. We greatly regret the tone of such a passage as this: "May those who remove their ancestors' modest grave-stones . . . have their own correct memorials broken up to mend the roads with." And again, the facetiae about Mr. Flick the architect, and Mrs. Berlin Baby-linen, and Messrs. Snip and Co., are not calculated to enhance the dignity of the subject. We would suggest, first, that the discussion of things ecclesiastical does not necessarily involve the adoption of the style of the *Rock* or the *Church Times*; and, secondly, that a susceptibility to the conditions of art should not be without its influence, even on controversial literature. But to return. We have in these two works two broad principles maintained. The first is the need of the widest view of art and of the most frank recognition of all modern practical requirements; the second, of the necessity, as a condition of ecclesiastical art, of mediaeval uses or uses differing from these in a very small degree. Unquestionably this apparent duality in theory is not without its example in the practice of individual architects. Not only do we find the same artist founding his ecclesiastical work upon mediaeval precedent and his domestic upon some totally distinct style—say, for instance, the style of the eighteenth century—but it is notorious that the greater the range in the choice of styles, the greater often is the accuracy with which each is understood. Nor do we think that we shall satisfactorily bridge, or even diminish, the great gulf between two such styles by the employment of Mr. Jackson's catholic definition of Gothic, however *vraisemblable* it may appear when examined in the light of history.

However startling this duality of tendency may be to those who desire unity of aim as a primary condition of success in art, we are disposed to justify it on the following grounds. The influence of architectural art may be divided into two main features:

utility and association. The degrees in which these two elements are combined are different for the two main branches of architectural art—association predominating in the ecclesiastical, and utility in the secular domain.

In the second place, association in ecclesiastical architecture is, on the whole, based upon the characteristics of the styles of the middle ages; whereas in domestic architecture the associations are as numerous as the types which various tastes and conditions of life have developed at different periods.

In the third place, those who thoroughly realise the state of anarchy into which we have necessarily been thrown by the absolute breach of that continuity which has been an invariable condition of all previous developments, will understand how the ultimate interests of art will be best consulted by a catholic and accurate study of very various examples, so that the direction of future progress may be ultimately determined by experiment rather than by theory.

BASIL CHAMPNEYS.

The Rape and Return of Proserpine. (Der Raub und die Rückkehr der Persephone). By Richard Förster. (Stuttgart, 1874.)

The Forms of the Gods and Heroes in Greek Art. (Herosen und Götter-Gestalten der Griechischen Kunst). By Alexander Conze. (Vienna, 1874.)

THE study of Greek mythology has of late entered vigorously upon a track which, if not altogether new, promises, under new hands, to lead to important results. For some time the chief auxiliary to this study had been a comparison of other ancient mythologies, and by this aid conclusions have been arrived at which, reckoning only those on which a certain unanimity prevails, are both numerous and highly instructive. From the nature of the case, however, these conclusions pointed only to the original conceptions of the Greek deities and heroes. As to how those beings were regarded when they had come to what, by comparison, may be called their full estate, Greek records were left to speak for themselves. So far as these records were literary, they were diligently searched and ingeniously compiled; but so far as they were handed down in monuments of art, they suffered from comparative neglect; not, certainly, at the hands of Gerhard and his school, who maintained and acted up to their convictions that mythology should be included as a branch of archaeology. But an opposite way of thinking prevailed among archaeologists: that of treating the ancient monuments principally from an artistic point of view. Fortunately this has been carried on with such energy that the mass of published monuments is already sufficiently large and solid to enable the mythologist to build upon it without adding to his proper labour much of archaeological research. To make his task easier still, an elaborate system has been set on foot of collecting and classifying under distinctive heads all the mythological subjects found on ancient works of art.

The first great undertaking in the direction of what is called in Germany *Kunstmythologie*, that is, the record of myths handed down in works of art, was begun by Overbeck, and that on a scale so colossal that it is scarcely to be hoped he may live to finish it. A large volume of the series devoted to Zeus, and accompanied by enormous plates, appeared in 1871, and a similar service was rendered to Hera in 1873. Meantime the obvious utility of such books, and perhaps also the restricted range of thought which they require, have brought many other workers into the field, and among the results which have already appeared may be mentioned *The Erinyes (Die Erinnyen)*, by Adolf Rosenberg; *Aphrodite, ein Baustein zur Griechischen*

Mythologie, von J.J. Bernoulli (Leipzig, 1873); and *The Rape and Return of Proserpine (Der Raub und die Rückkehr der Persephone)*, by Richard Förster. To the last-mentioned book a word of special praise is here necessary for the brevity, not inconsistent with thoroughness, with which the myth is traced through the ancient poetry, philosophy, and literature. In descriptions of works of art the equivalent of brevity is classification, and in this respect no complaint need be made of the work now before us, though the descriptions are still bulky enough not to be very inviting. With regard to existing works of art representing the subject of the Rape or Return of Proserpine, and of a date which may be set down as before the time of Praxiteles, the only examples here given are three small terra-cotta reliefs found at Locri Epizephyrii, where the worship of Proserpine is known to have stood in high favour. Of these three examples one is correctly described as in the British Museum. It is not, however, alone there, but is accompanied by three other examples of the same subject, each with certain varieties of detail, but clearly all fragments of one and the same monument, possibly a small sarcophagus, to which also the second at least of the other two fragments referred to by Förster, so far as can be judged from an engraving, appears to belong. If it is here rightly conjectured that these and the other fragments found with them, and now in the British Museum, the Museum of Naples, and elsewhere, are parts of one object, it would be interesting to see an attempt to put them together. It is certain that the various figures have all a character suited to a sepulchral monument, and that they harmonize with each other completely in point of style. Their style is what is called *Hieratic*, that is, an ancient manner retained under religious influences till later times, but not readily distinguishable from the style called *Archaistic* to denote it as being a revival, not a continuation, of the archaic style. But while describing the figure in the British Museum as Hieratic, Förster seems to follow Curtius, who published it in the *Archäol. Zeitung*, 1870, p. 77, in assigning it to an early period. His words are (p. 110) "at the earliest, towards the end of the sixth century, B.C." Now we do not say that in the figure immediately in question there is positive evidence of a later date, but there is a suggestion of it which is strongly confirmed by the presence, on three of the other fragments in the Museum found with it, of vases of a fluted pattern such as hitherto have not been shown to have existed in Greece much before the time of Alexander the Great. On the other hand, it is always possible that vases of this class may have been frequently produced at a much earlier period in Etruria, and thence found their way among the Greeks of Southern Italy. But this can hardly be made use of as a likely conjecture at present, when the date of Etruscan works of art is so much in obscurity. Had Förster seen these fragments, it is probable that his book would not have contained even its small list of sculptures executed previous to Praxiteles; possibly also he might have been led to reconsider the question whether, after all, the fragment published by Curtius really represents Pluto and Persephone. There is no direct indication of Pluto; and failing this, it would perhaps be wiser to seek an explanation in some other ancient rape, the more so as in the companion fragments the robbers are still less of the type of Pluto, one of them indeed being obviously female.

With regard now to Conze's *Götter und Heroen Gestalten*, it is a pity that a text so remarkable for thought, and yet for precision, so highly welcome at the same time as a relief to Overbeck's ponderous volumes, should be wedded to a most indifferent set of plates. A. S. MURRAY.

THE little town of Urbino celebrated Raphael's birthday on April 6 with its customary fête.

EXHIBITION OF THE SOCIETY OF PAINTERS IN WATER-COLOURS.

THE impression proper to the Suffolk Street Gallery in any given season depends upon the proportions of the two elements which it regularly exhibits. Here are regularly many things which do but renew in the student the sense of a familiar nullity; and a few which attract him with the sense of originality, of artistic reality, whether in effort or in achievement. When I say nullity, I mean nothing disrespectful; but only that a large class of our painters in water-colours seem to me to have acquiesced in a stationary condition of their own powers, and that the work of quite stationary powers, however respectable in the first instance, ceases to be interesting in the long run. Year after year the same artists set before us the same effects with slight variation. From one, we have effects more approximate to nature, from another, more inclining to convention; but it is seldom that the grip upon nature is very firm on the one part, or the ideal of the mind very striking on the other; commonly one feels—here is an artist who has nothing particular to say, and has found the language which suits him best for saying it; very well for a while, especially since his theme is pleasant, and since he babbles of green fields, of downs and braes and shores; but some of us, on repetition, get tired of this; some of us insist on asking of art something particular—if a transcript of nature, then one which shall really have something of subtle, masterly, and original; if an artistic abstraction from nature, then one which shall really set vibrating some chord in a sensitive imagination.

And so one gets to resent the monotony, the mediocrity, of that respectable school of landscape which has for years predominated in our Water-Colour Society. Above all, one finds it almost impossible to make remarks about them individually. The landscapes that seem to call for remark are those of the younger men who have not yet settled into any stationary phase, who are growing, or at any rate trying to grow, and who do, by methods which are not yet a routine, seek to express something significant in nature, to strike some true chord in the spectator. Of these, it is certainly Mr. Albert Goodwin who this year bears the palm. He contributes seven pieces, all of them interesting, and some, I think, of signal excellence. The small picture numbered 167 (*Colour in Sunlight—Lago Maggiore*), is perhaps at once the boldest and the most successful, aiming at a poetical extreme of richness in the rose and azure of the South, and hitting the aim without any sacrifice of delicacy. Next come the two studies of Alpine slopes in the season of flowers (108, 175), one dedicated to the gentian, the other to the Alpine rose. The effect of a vivid sky-coloured sheet of flowers on the ground, enchanting to all the senses in reality, is one of those delights of nature which art too often proves herself unapt to render. But Mr. Goodwin has done admirably with his gentian-covered slope in the sun; the vivid blues and greens are kept in admirable harmony, and balanced by the shadowed mass of mountain on the left of the picture; nothing is more positively true, or done with a more exquisite hand, than the passing shadows of light cloud in the foreground; in all parts, both of the painting and drawing, there are the finest evidences of subtlety and feeling. In other contributions Mr. Goodwin shows himself quite remarkable among his compeers in the study of Alpine scenery, by his high sense both of composition and colouring. The masses of rain-clouds in No. 81 (*A Stormy Sunday, Simplan*) are admirable for the richness, almost the glow, of sinister colour which is contained—as nature is prone to contain colour in shadow—within their blackness. Next to Mr. Goodwin in the poetical treatment of landscape, though far behind him in technical accomplishment, we should be inclined this year to

place Mr. W. M. Hale. Both of this gentleman's pictures exhibit evening effects, in which the prevalent tones of the land are purple, with the twilight blue of the sky passing into green and amber. The scene of one (*The Great Rock of Corgach*—168) lends itself to a broad and simple composition, with water of a very dark and opaque blue lying in the foreground under the mountains, and the sky seen only high up on the left; the other (156) is an inland Devonshire scene, with a wet lane winding in the foreground, and trees holding their upper branches above the slopes against the sky. In both of these Mr. Hale shows the power and the sentiment of a true colourist; but at present allowance has to be made for something inexpert in his touch which gives the work a grainy and uncomfortable look, especially in the skies. Passing to contributors of longer standing, there is Mr. Boyce, whose manner, indeed, does not change much—but then it is so good, his transcripts from nature are so amazingly subtle and powerful in the order to which they belong. If I were to select for especial admiration one among his several studies of English summer greens and the level lines of English pastoral landscape, it should be the *Shalford Common* (239); and after that, in a vein which is the result of old travels—and which, with Mr. Boyce, one cannot help feeling to be accidental and irregular—the *Khan at Cairo, January 1862* (291). This is an architectural drawing, extraordinarily delicate and refined in colour, and at the same time showing, in the attire of the oriental personages in the court, a courage rare with this artist in the use of vivid primaries. The work suggests a comparison with one that hangs immediately below—the *Palazzo del Governo, Perugia*, by Mr. A. Glennie (292); this also is an architectural drawing not without merit, but looks curiously empty and poor in the comparison with its neighbour. And now we are upon architecture, attention is due to the works of a lady associate exhibitor, lately elected, Miss Clara Montalba. The Society promises, I should say, to gain more by the accession of this lady than by that of another new Associate, Mr. Walter Duncan, whose two illustrations of Undine show a treatment rapid as their subject. Miss Montalba's pair of St. Mark's interiors are not carried very far as to finish, are indeed not much more than sketches; but they show a keen eye and a vigorous hand; the tempting and difficult relations of porphyry pillars and mosaic vaultings in the religious light are seized with considerable art; and in another outdoor picture, showing one of the quays of Venice, the same power of seizing values and relations is still more conspicuous: the black rigging relieved by some red pulley blocks, the green of the water and the white of the buildings in the background, are quite excellently got together.

But to return to the well-known exhibitors of landscape—Mr. A. Hunt's contributions this year are not quite so important as usual, but it is needless to say that they show all his usual care and all his usual pertinacity in the grapple with nature and her difficulties as she presents them to him. Perhaps the most delightful is the delicate piece of mist and water work which the artist calls *The Stillness of the Lake at Dawn* (288): the *Miner's Path near Coniston* (281), on the same screen, is a small study for the subject of an oil picture sent, I believe, to the Royal Academy. Among the more popular seniors, Mr. George Fripp is quite his best self with his picture from the Isle of Sark (19); Mr. Alfred Fripp, very luminous and pleasant with his *Sea Anemones* (231); and Mr. Dodgson, singularly happy and original with the harmony of his cliffs and sky in his *Bait Gatherers, Whitby Scar* (125).

If we take as a class apart the pictures into which landscape and figures enter on equal terms, Mr. J. D. Watson and Mr. E. K. Johnson call for particular notice in the class. Mr. Watson is a copious and versatile contributor, generally on a small scale, and there seems to me to be a great

inequality in what he does. Some of his little costume incidents hardly rise above a vulgar level; while there is not, upon all the walls, a truer piece of observation and quiet artistic work than the little hunting picture *Check* (193). The whole little scene of bare woods and white autumn daylight is capitally felt. The design of the principal group, a horseman tightening his girths and the horse fidgetting, is admirable, and the motive one that I do not remember to have seen before. Only less happy than this are the two woodland scenes on the first screen (224, 236), full, both of them, of the most careful study of trunk and root forms, as well as striking, both, a true note of sentiment. But in the trial of careful study, it is Mr. Johnson who comes far before all competitors. Since the early Pre-Raphaelites, one has seen no finishing of out-door objects more loving, assiduous, and minute, than in the two pictures of *Summer Time* (44), and *The Reader* (71). In the former case, the garden background is quite exquisite, both in feeling and detail, and the design and painting of the flowers perhaps as fine as such work can be; the Reader and his hearers are in a wood of soberer hues. If in both cases one thinks more of the background, the flowers and foliage, than of the persons, that is not from a want of harmony or subordination, but because in truth the persons are not done with so fine a feeling. They are fully as careful and thorough, but they have a certain commonness—both the girls who, in the summer picture are busy collecting rose-petals for *potpourri*, and the man who, leaning in a diagonal both physically and pictorially uncomfortable, reads aloud to a pair of girls seated in the fork of a tree.

The President of the Society, by two at least of his contributions this year, ranges himself in the first of this class—the painters of mixed landscape and figure. And admirable the style of his landscape is—not, of course, with the excellence of literal or topographical study, but with that of vivid and poetical abstract impression. *The Lost Route* (72) is a noble piece of this class. Sir John Gilbert also stands easily at the head of the figure-painters proper, with his two large Shakespeare pictures, displaying, as he always does, in the *savoir-faire*, and indeed the real grandeur of his composition, and in the masterly treatment of his coloured stuffs and surfaces, many of the qualities which, with a different training and with a greater distinction and individuality in the heads, would make of his art something great in the high sense of greatness.

SIDNEY COLVIN.

ART SALES.

BRISTOL porcelain has of late years been so eagerly sought after, and specimens have attained such a fabulous price, that it is no matter of surprise that Sotheby's rooms, last Friday, should have been crowded on the occasion of the private view of Mr. Edkins' collection, now about to be dispersed. With the exception of Mr. Fry's, of Bristol, possessor of the fine series of vases, Mr. Edkins' collection has been long known as one of the most extensive in Bristol porcelain; both collectors, belonging to families engaged in the Bristol works, had special opportunities of procuring the finest examples of the manufacture.

Among the specimens here assembled are to be seen a cup and saucer of the celebrated Burke service, sold in 1871, when the teapot fetched twice its weight in gold. This cup and saucer was bought for 100*l*. There is also one of the set made by order of Edmund Burke as a present to Mrs. Smith, in acknowledgment of the hospitality he received during his electioneering at Bristol. The dark green of the laurel festoons forms a charming contrast with the matted gold decoration.

To enumerate all the specimens of interest would be impossible. Many figures, among others the four quarters of the globe; medallions, one of Franklin specially, surrounded by the delicate

raised flowers for which Bristol was so celebrated; choice examples of Bristol glass, besides Plymouth, Worcester, and other English ware. The collection consists of about 500 specimens, and has the advantage of a catalogue, superbly illustrated with woodcuts from the well-known work of Mr. Hugh Owen, the great authority on Bristol ceramics.

AMONG some pictures sold in Paris on the 16th instant, were: Chaplin, *Reflexions*, 3,300 fr.; Corot, *Paysage*, 4,100 fr.; Courbet, *Marine*, 1,800 fr.; *Paysage*, 1,700 fr.; Daubigny, *Bords de l'Oise*, 3,050 fr.; Diaz, *La Mare*, 7,250 fr.; *Grès de Fontainebleau*, 2,700 fr.; *Paysage sous bois*, 4,100 fr.; Jacque, *Moutons à la lisière d'un bois, effet d'orage*, 10,020 fr.; Jules Dupré, *Paysage*, 2,950 fr.; Jacque, *Moutons au pâturage*, 5,300 fr., and another picture, same subject, 4,500 fr.; Vollon, *Le Déjeuner*, 1,950 fr.; *Vue de Venise*, par Ziem, 4,425 fr., &c.

NOTES AND NEWS.

AN interesting exhibition of goldsmiths' art has been opened at Liverpool at the Club Rooms in Suggall Street. Among the most noteworthy contributions are some splendid specimens of silver-gilt *repoussé* work, of Nürnberg workmanship, lent by J. G. Morris; three chalices (one of the fourteenth century), and several belts of Icelandic workmanship, lent by Edward Rae; an argosy of silver and other metals richly wrought, and several other excellent specimens of Japanese metal work, lent by James L. Bowes. The English silver work of the eighteenth century is not in general remarkable for its beauty; but there is one piece that has an interesting association—a book of silver, engraved with the inscription, "William Hogarth to Dr. Saml. Johnson, 1762." It was probably Hogarth's own work. A chalice-shaped cup of early English workmanship, bearing the inscription, "Henry de Beaumont," and containing some coins of Edward III., is the only example of English mediaeval work exhibited, though in the goldsmith's craft England was not so far behind other countries of Europe as might be supposed, considering how few articles of early English workmanship exist. An instructive preface to the catalogue of this exhibition has been written by Edward Quail, who is one of the largest contributors.

THE Musée de Cluny has just made the acquisition of a monument of great historic interest—an equestrian statue of Joan of Arc, in armour, and holding in her hands the French standard. This statue, which is a work of the beginning of the fifteenth century, is of wood, painted in colours and heightened with gilding. It is above four feet high. She is on horseback, her head covered with a helmet of which the visor is raised so as completely to uncover the face. Her armour is precisely similar to that of the bronze statuette of which the mould is preserved in the Musée de Cluny. The harness of the horse, the bit and bridle, present the same characteristics. This statue has been preserved in the family of a drawing master at Montereau, who, at the request of M. du Sommerard, has given it up to the Museum. The base which supports the horse shows marks of fastenings, which leads to the supposition that it was carried in solemn procession.

THE War Museum of the Invalides likewise has just acquired a relic of the Maid. It is the suit of armour given by Charles VII. to Jeanne d'Arc, and deposited by her in the Abbey of St. Denis after she was wounded under the walls of Paris.

THE retrospective Exhibition at the Palace of the President of the Corps Législatif, the proceeds of which are to be devoted to the colonisation of Algeria by emigrants from Alsace and Lorraine, opened on Thursday, the 23rd instant.

A POSTHUMOUS exhibition of the works of Chintreuil, the landscape painter, is to be open daily, without fee for admission, from April 25 to

May 15, in one of the rooms of the Ecole des Beaux Arts, between the hours of eleven and five.

THE *Giornale Artistico* of Florence has already published a programme of the proceedings that are to take place at the proposed Michael Angelo centenary celebration in 1875. The fête on this occasion will be continued, it is stated, for three days, during which time the statue of Michael Angelo will be inaugurated, and his bust in bronze placed above the door of the Buonarrotti house in Florence, the façade of which has been newly restored. At night this house, as well as that at Lessignano, will be illuminated. The Torre del Gallo will also be lit up, not exactly in honour of Michael Angelo, but to remind the world that, by a compensating Providence, on the day that he died Galileo was born. By a not unnatural mistake, seeing that Michael Angelo was born in 1474, many journals have stated that his centenary festival would be held this year. It is the difference of old and new style that makes this apparent discrepancy. The old Florentine year began on March 25, and Michael Angelo was born on March 6.

M. HÉBERT has recently brought home with him from Rome a painting of the Virgin and Child which has created a great sensation in the artistic world of Paris. The subject is conceived in a solemn, poetic mood, with a tinge, we should imagine from the descriptions we have heard of it, of the old Byzantine melancholy. The type of the Virgin, however, is purely human, being that of the Syrian woman of the present day, with fine black eyebrows nearly meeting. As in *The Shadow of Death* by Holman Hunt, so in this picture by Hébert, an ideal conception is treated in a realistic manner. The picture has been presented by M. Hébert to the church of his native place, La Tronche, and has been blessed by the Pope. The artist will not, therefore, in spite of the solicitations of his friends, send it to the Salon, but he has not objected to its being exhibited at the Rue Chaptal with other works destined for exhibition in May. Emile Rousseaux, it is said, has been chosen to engrave this great work. M. Hébert, it will be remembered, is the new member of the Académie des Beaux-Arts.

A PORTRAIT of the Prince Imperial, painted by M. J. Lefèvre, formerly professor of drawing to the Prince, has been accepted for the salon; but M. Lefèvre has been warned, it is said, that he must immediately withdraw it if it should become the object of any kind of manifestation. The Prince is represented standing near a table, on which is placed an enormous bouquet of violets covered with black crape.

MR. OWEN JONES, the distinguished architect whose name is associated in most minds with the Great Exhibition of 1851 and the Alhambra Court of the Crystal Palace, died last Sunday, April 19, after a long and painful illness, at the age of sixty-five. Mr. Owen Jones devoted his attention chiefly to the decorative branch of his art, and no one perhaps ever attained a more complete understanding of its ornamental details. In his *Grammar of Ornament*, a magnificent text-book published in 1856, he showed the progress and expounded the principles of the decorative art of all countries from the earliest times to the present day. His decoration is especially remarkable for its effective employment of colour, an element of which most modern architects are somewhat afraid; his use of it, indeed, has excited much opposition among the members of his profession.

The Alhambra Court of the Crystal Palace is not a merely fanciful design, nor is it a direct copy of any portion of the ancient Alhambra; it is the popularisation of the great decorator's vast knowledge on the subject. In his work, *Plans, Elevations, and Sections of the Alhambra*, published in 1848, we have a more scientific expression of that knowledge. His designs for decorative furniture (chiefly executed by Messrs. Jackson & Gra-

ham) have been admired at many exhibitions, and last summer attracted much attention at Vienna. So wide indeed was his reputation, that, according to the *Daily News*, the Khedive of Egypt employed him to design a complete set of furniture for an oriental palace. Mr. Owen Jones was the Gold Medallist of the Royal Institute of British Architects, and had won many other honours of like kind both at home and abroad.

THE four splendid panels of Gobelin tapestry, with the story of Jason and Medea, described last week in the notice of the Salamanca collection, were sold for 3,700 guineas.

THE sale of the pictures, studies, and drawings of Théodore Carnelle d'Aligny, one of the most distinguished landscape painters of the French school, is to take place at the Hôtel Drouot, on May 4. The most important of the pictures are *L'Entrée d'Enée aux Enfers*, *Saül consultant la Pythonisse d'Endor*, and the *Souvenir du Lac d'Abano*. Among the studies are numerous scenes in Greece, Italy, and Switzerland, while among the drawings, *Pentélique*, *Prométhée*, *Corinthe*, *Delos*, are especially worthy of notice.

THE French Photographic Society, a society of purely artistic and scientific aims, will open its tenth exhibition at the Palais de l'Industrie on the same day as the Salon, May 1. Foreigners are invited to contribute to this exhibition, and medals and honourable mentions will be granted to the most successful competitors. The works sent by the society to the Vienna Exhibition, and which gained the first diploma, will form part of the exhibition.

M. HENRI DELABORDE has an article in the *Revue des Deux Mondes* for April 15 on the late M. Victor Baltard, which gives a fair, and on the whole favourable estimate of a laborious and successful career. M. Baltard's wonderful readiness and fertility of resource was strikingly exemplified by his producing within a few days of the condemnation, first by public opinion, and afterwards by the Emperor, of the original design for the Halles Centrales, for which he was not really responsible, the design which was actually carried out. M. Delaborde gives an anecdote which we cannot but quote as doing equal honour to both parties concerned. Baltard, while a student at the French Academy at Rome, being a married man, was in straitened circumstances, and was obliged to use dish covers of iron. One day Ingres, the great painter, then Director of the Academy, called with a set of silver covers, charging Baltard to accept them, "as he would have received them from the hands of a father, and as obedience likewise required him." Baltard related this anecdote to M. Delaborde towards the close of his life with tears of gratitude.

THE Signori Giacobbe and Leone Trieste have just discovered, in their property at Abano, near Padua, whose sulphureous thermal mud baths have been celebrated from the time of the Romans, two large antique bathing-cisterns, capable of holding several persons, as was the custom among the Romans. The sides of both, and the paving of the smaller one, are of regular squares, formed of the volcanic stone of the neighbouring Euganean hills; the paving of the other, which is much larger, is in irregular squares of the same stone, united by strong cement. Probably the first cistern, so well preserved that it appears of recent construction, belongs to the time of Theodoric. The latter is well-known, written at his command by Cassiodorus, in which he desires the architect to restore the buildings of these baths. The second cistern is not so much preserved, whence it may be inferred to be more ancient. With the cisterns were found a votive inscription to the Abanese waters, and the fragment of another recording the name of a Paduan prefect.

THE architectural and sculptural remains mentioned in the ACADEMY of February 14 as having been sent to the Louvre from the shores of the

Tonking river, by M. Delaporte, a lieutenant in the French navy, turn out to be of even greater archaeological importance than was at first anticipated. It appears that all along the banks of the Tonking, and in the kingdoms of Cambodia and Siam, there are immense plains covered with the ruins of an ancient civilisation that must have had a long duration, and have attained to a high degree of perfection in the arts. Vast palaces and temples entirely covered with sculpture have been found, and single statues that are spoken of as being executed with the greatest amount of skill. Among the monumental remains sent to the Louvre are several fine statues of Buddha, a remarkable figure with eight arms, a group of two giants squatting down, one of whom has five heads and ten arms, in which he holds a dragon with nine heads; three lions of immense size, and several female figures, besides numerous busts, heads, capitals of pillars, friezes, entablatures, and other fragments. M. Delaporte has also sent a number of photographs and plans of the gigantic ruins that he has discovered that will perhaps aid archaeologists in their researches into the history of the early period of civilisation which these remains attest.

AMONG the valuable services rendered to Archaeology by the Instituto di Corrispondenza Archeologica in Rome, not least is the watch it keeps, by means of its Secretary, W. Helbig, over the various excavations going on in Italy, and especially the excavation of ancient tombs, the form and contents of which it is of great importance to have recorded at the moment of their discovery. In the case of Etruscan tombs such supervision is particularly necessary, because it sometimes happens that they yield objects (e.g., vases), which would go forth as archaic, were it not for other obviously late articles found by their side. If at the opening of a tomb with mixed contents of this nature no one has been present who is qualified to say whether or not it had been opened before, in ancient times, for some new interment, and these later articles then laid in it, the contents of such a tomb are worthless, at least for the present great question as to archaism in Etruscan art. In the March number of the *Bullettino* of the Institute above named, M. Helbig gives an account of the opening of three tombs at Corneto, the ancient Tarquinia. One was found empty, the other two contained each the remains of an unburned body with a number of personal ornaments in gold, silver, and bronze, with which the deceased had been buried, all bearing the stamp of a very high antiquity and being of the same class as the ornaments from Praeneste now in the British Museum; fibulae in bronze ornamented with amber, necklaces of amber beads, coloured glass and silver pendants, chains formed of small bronze rings, &c. It has frequently been remarked how well the ornaments found in these early Etruscan tombs are suited to recall Homeric passages in which mention of articles of personal ornament occurs. M. Helbig now points out another coincidence which had not before been remarked, and in doing so clears up what it was always hard to understand, viz., why these tombs contain so many fibulae or brooches compared with the tombs of later times, in which the Doric or Ionic chiton, requiring only two fibulae, was worn. In *Odyssey* xviii. 201, Antinoos gives Penelope a peplos fastened with twelve golden fibulae. To show how these fibulae were applied, there is the passage *Iliad* xiv. 179, where the dress in which Hera prepares to meet Zeus on Mount Ida is described *χρυσείῃσι δ' ἐνέηται κατὰ στῆθος πεπλόησιν*, the scholiast adding that the dress was in the Homeric period fastened down the breast, not as in later times on the shoulders. If we suppose the inmates of these tombs to have worn a dress so fastened, we at once account for the presence of fibulae in such large numbers, and come to the conclusion that the persons must have lived while the civilisation of the Homeric age was yet in force. It has also occurred to M. Helbig that

the small spiral ornaments, whether of gold, silver or bronze, which, he observes, are usually found beside the head of the skeleton, were used to keep the hair in tresses or sets of curls, and therefore illustrate the line *Iliad* xvii. 52, *παρὰ τοῖς ὤμοις τε καὶ ἀπὸ τοῦ κεφαλῆς*, all the more since these spirals not unfrequently end in the head of an animal. Usually that animal is a snake, but it might perhaps as well be a wasp, to compare with the *χοῦροι τριπίτες* which the Athenians wore, and which M. Helbig regards not as hair-pins with a grasshopper at the head, but as spirals like those now in question terminating in the head and wings of a grasshopper.

WE have received the first number of a new Italian journal, entitled *Giornale Ligustico di Archeologia, Storia, e Belle Arti*. It is especially the official organ of the Società Ligure di Storia Patria, and will publish the papers read at that institute; but it will besides furnish information concerning the various archaeological researches at present carried on in Italy, and the restorations that are being effected. The present number contains a long history and detailed description, by Professor Santo Varni, of a painting of the Crucifixion in the Cathedral of Sarzana, belonging, it is affirmed, to the year 1138, and painted by an artist named Guglielmo. Rosini mentions this Crucifixion in his *Storia della Pittura Italiana* (vol. ii. p. 288), and considers its inscription and date to be genuine; but Professor Varni is the first who has given any historic account of this remarkable old work. The remainder of the number is taken up by the proceedings of the society. The *Giornale Ligustico* is published at Genoa, under the direction of L. T. Belgrano and A. Neri.

THE STAGE.

"PRIDE" AT THE VAUDEVILLE THEATRE.

MR. JAMES ALBERY has not maintained the reputation won by his comedy, *The Two Roses*. The favour with which that play was received was not, perhaps, proportioned to its merits; but the dialogue was of a kind then almost new and pleasing by its novelty to the audience: there was a careful portrait of an adventurer drawn somewhat in the manner of Balzac, and the character was played with finished excellence by Mr. Henry Irving. But this earliest success was followed by productions of various classes from the pen of the same author—sketches of modern society, and plays romantic, fantastical, and farcical, and the judgment passed on the first comedy was virtually reversed. Mr. Albery was found to be wanting in the first requirement of scenic representation, the act of dramatic construction. With the barest knowledge of the more mechanical rules of stage carpentering, he showed no power of sustaining interest or of subordinating his characters to one central figure. The personages had no individuality, were merely mouthpieces for the utterance of repartee. The wit of *The Two Roses* had become weak and emasculated, utterly unlike the robust style of M. Emile Augier and the best French dramatists. Everything was sacrificed to epigrams, and these not scholarly or vigorous, but often laboured, often degenerating into buffoonery, and very often offensive. This is the new style of comedy written for the English stage, and Mr. Albery has the credit of bringing it into fashion. His latest play, *Pride*, produced on Wednesday night at the Vaudeville Theatre, belongs to the class, and, though the story is ridiculously confused, it was received with applause.

Many fine comedies have been written on the motive of pride conquered by misfortune. But the arrogance of a retired trader, ashamed of his former business, and aping the manners of persons of good birth, is not a substantial ground for a dramatist to build on. M. Poirier, in the well-known French play, was certainly in a somewhat similar position. But though tickled with the prospect of one day being called Baron Poirier, and thus

led to pay for the extravagance of his noble son-in-law, the vanity of M. Poirier soon passed, and he was found to be a human and sympathetic character. Mr. Cadman Cadbutton, of Mr. Albery's comedy, is neither human nor sympathetic. His life is troubled by the fear of two discoveries: the first, that he had made money by carpet-weaving; the second, that he had formerly left his wife and children to starve. But as when both these facts are found out he seems in no way affected, it may be surmised that the play is constructed on a very inadequate motive. The dialogue is flippant, and seldom brilliant. The author's desire to sparkle is never concealed. All the characters, whatever their station, are provided with grotesque retorts and poetic similes, and soon grow very wearisome.

But the comedy is generally acted in a superior manner. The character of the merchant is one of those which M. Got performs with such consummate art. There is a strut and vulgarity in his impersonation of the trader in Jean de Thommeray which is inimitable. Mr. William Farren takes almost too refined a view of the part. If the man were so refined he would not be so arrogant. But there are touches in his playing which betray the excellent actor; as when he listens to the tale of his former misdeeds, told as concerning an unknown person. Mr. Thomas Thorne is entitled to praise for his artistic representation of the character of one Barnabas Smith, a mechanic who devotes the time he can spare from his usual occupation as locksmith to reading scientific works, to inventing implements of domestic utility, and to delivering some of the author's sharpest sayings. Quite the most successful of these was to the purpose that marriage was like the effect of throwing a stone into a pond, beginning in a little ring, and ending in a large family circle—a fair specimen of the remarks for which dramatic interest is frittered away. Mr. Thorne has the gift, which many actors lack, of appearing to deliver his repartees unconsciously. Mr. David James had an ungrateful part as a weak-willed baronet, dependent on the charity of his brother-in-law, Mr. Cadbutton. This unhappy person, described as an "eccentric gentleman," has an unfortunate habit of making unpleasant remarks in French, which bring him into disgrace, and a more unfortunate habit of gambling, which induces him to steal money. The character is wholly artificial. Mr. Warner is not very satisfactory as the secretary who makes love to Miss Cadbutton; but the fault should perhaps be ascribed to Mr. Albery. Frank Leyton is one of the most insufferable of lovers, with a disregard for good breeding which is almost startling. Mr. Horace Wigan did good service as a conventional stage-villain, a class of character in which he has had much experience since the days of the *Ticket-of-Leave Man*. Of the ladies the most noteworthy is Miss Kate Bishop, who lends much grace to the small part of a village schoolmistress. Miss Amy Fawcitt must restrain her spirits if she hopes to sustain with success such characters as the heroine of this play. It may be doubted whether the author had any distinct conception of his creation; but he could scarcely have intended her to be of such free manners that she loses respect, so fickle and foolish that the sacrifice she is supposed to make at the end of the play leaves the audience perfectly indifferent. Miss Larkin also appears in the cast. WALTER MACLEAN.

THE Tichborne Trial is to be transferred from the law-courts to the stage. At Rome, an opera is in rehearsal of which the Claimant is the hero; and at the Ambigu Theatre, now the recognised home of melodrama in Paris, negotiations have been opened with M. Adrien Barbusse for the reproduction of his drama in seven tableaux, entitled *L'Affaire Tichborne*.

At the Royalty Theatre, an adaptation of the French play *Moi*, formerly performed at the Théâtre Français, has been produced under the

title of *The Main Chance*. Miss Henrietta Hodson and Mr. Righton sustained parts in it with success, but the piece was coldly received. It was followed by the *Fire Eaters*, which is founded on a Palais-Royal farce, and served to introduce to the London stage a new actor, Mr. Fosbrooke.

THE St. James's Theatre will open on Saturday, May 2, with a revival of Mr. T. W. Robertson's play *Progress*, and an adaptation of Offenbach's opéra-bouffe *Vert Vert*.

THE latest productions on the Parisian stage are for the most part comic operas. At the Folies Dramatiques a work of M. Coedès, formerly musical prompter at the Grand Opera, called *La Belle Bourbonnaise*, has obtained a notable success. The plot hinges on a resemblance between a country girl and the mistress of Louis XV., M^{me}. Du Barry; and the music, though showing signs of inexperience, is sufficiently lively. At the Bouffes Parisiens, Offenbach's operettas *Pomme d'Api* and the *Chanson de Fortunio* have been revived; and M^{me}. Theo has been transferred to the stage where M^{me}. Judic has hitherto reigned supreme. The Variétés Theatre is shortly to produce Offenbach's *Périscholle*, considerably altered by its authors, MM. Meilhac and Halévy.

Rob Roy has been produced at the Gaiety Theatre with all the original music, and with Mr. Phelps as Bailie Nicol Jarvie.

Two young writers, MM. Montréal and Blondeau have written for the Théâtre du Château d'Eau a play called *Colin Jampon*. Much expectation was raised by the announcement that real elephants would be introduced on the scene, and there were signs of disappointment when a cardboard animal, moved by two supernumeraries, made its appearance.

BALZAC's novel *Le Cousin Pons*, first part of the work called *Les Parents Pauvres*, has been adapted for the Théâtre Oluny, by M. de Launay. The novel being ill-suited to dramatic purposes, the playwright has taken great liberties with it, and has crowded his canvas with vicious characters; but the representation of the *Cousin Pons* by M. Charly is a remarkable creation.

MR. TOOLE has appeared in a new farce, *Billy Doo*, at the Globe Theatre. A piece of the same class, by Mr. Martin Beecher, is being represented at the Strand Theatre.

THE historical play of Mr. West Digges, produced at the Queen's Theatre on Saturday last, was received with disapprobation. The first act raised some enthusiasm, but the rest of the piece fell flat. Mr. Creswick and Miss Furtado played unsatisfactory parts with moderation.

DURING the comparative leisure of the winter season amateur theatricals are all the rage amongst most of the foreign communities in China, and the acting is often of a very respectable order. From Shanghai we learn that the A.D.C. gave a performance on February 27; that the comedietta, *A Cup of Tea*, with which it commenced, though brief, was well acted throughout; and that the burlesque, *Romulus and Remus*, was very successful. The local hits, we are told, were wittily conceived and pointedly applied, and the songs and choruses were admirably given by the members of the Glee Society and the soloists of the company.

MUSIC.

CRYSTAL PALACE CONCERTS.

WITH the exception of Mr. Manns's annual benefit concert, which takes place this afternoon, the present series of Saturday Concerts was brought to a close last week. As if resolved to conclude in a manner worthy of the reputation of his orchestra, Mr. Manns presented his audience with one of the most splendid renderings of the often heard, but ever fresh and welcome "Pastoral" Symphony to which we ever had the pleasure of

IN the same elaborate style as the book on Holland House, Messrs. Macmillan are preparing an edition of White's *Selborne*, with copious illustrations by Mr. Philip H. Delamotte, including original views of Selborne. The reprint will be full and exact, and scientific completeness as regards ornithology will be aimed at by means of additional notes.

It would appear as if all the great collectors of English china were "retiring from business." This week has witnessed the dispersion of the Edkins collection, and on the 28th Sotheby will sell the well-known English pottery of Mr. Emerson Norman, of Norwich, consisting of choice examples of Fulham, Newcastle, Lambeth-delft, and other earthenware, with some good Staffordshire statuettes, among which is the finely modelled figure of a female holding a child, attributed to Bacon, with some Bow, Chelsea, and Plymouth china, Bristol glass, &c.

AMONG the most interesting book rarities at Washington, says the *Bibliotheca Sacra*, is a quarto copy of Benoit's edition of Pindar, which belonged to John Milton. If Mr. Masson had seen the manuscript notes in this volume, he would have spoken in a more confident tone of Milton's Greek scholarship. They contain 35 quotations from Eustathius, 63 from Homer, 27 from Callimachus, 9 from Moschus, and 15 from Tzetzes. Of Lycophron's *Cassandra*, Lord Macaulay says that it is "the most obscure work in the whole range of ancient literature;" yet Milton had read it, and made notes on it, and cited from it eighteen passages, while he was reading this Pindar, at the age of twenty-one.

A BORDEANO telegram from Athens states that Dr. Dethier, the director of the Imperial Museum at Constantinople, has applied, in the name of the Turkish Government, for a sequestration of such of the antiquities found by Dr. Schliemann in the Troad as have been removed by the discoverer to Greece. Dr. Dethier made the application with a view to the consignment of the objects in question to the Turkish National Museum, but the Greek tribunals have decided it to be inadmissible.—*Levant Herald*, April 15.

SECRETARY.

J. LOGAN LOBLEY, Esq., F.G.S.

The SCIENTIFIC CLUB is founded for the Association of Gentlemen of Scientific Tastes and Pursuits.

Gentlemen are eligible as Candidates for Membership of the Scientific Club who (1) are Fellows or Members of any Society, Academy, Association, or Institute, having for its object the Promotion of Abstract or Applied Science, and Publishing Periodical Transactions, or (2) have by their known Researches, Explorations, or Publications, given evidence of Scientific Attainments.

Premises for the accommodation of the Members of the Club will be opened as soon as possible.

The number of original Members being complete, a limited number of new Members will be admitted by Ballot at the following fees:—Admission Fee, Two Guineas. Annual Subscription, Town Members, Three Guineas; Country Members, One Guinea and a Half.

All applications for Forms of Proposal to be by letter, addressed the SECRETARY OF THE SCIENTIFIC CLUB, Committee-Room, Westminster Palace Hotel, S.W.

EVERY SATURDAY, and to be had, by Order, of all Booksellers and Newsmen.

PRICE FOURPENCE.

DISCOVERY in all branches.

CRITICISMS of the PICTURE GALLERIES,
of the STAGE, and of MUSIC.

OPINIONS OF THE PRESS.

"The ACADEMY may fairly claim the first place among literary journals as the representative of the ripest and soundest English scholarship; and its criticisms of art, literature, music, and the drama are informing, incisive, and trustworthy. . . . It is hardly possible in a few words to give an idea of the excellence of this old journal in its new form, but every subject with which it deals (and it deals with many untouched by other papers) is entrusted to the hands of men who know what they are writing about, and the result is a freshness and fullness of information and an accuracy of judgment which commands confidence, and ministers to the intellectual satisfaction and pleasure of the reader. . . . The accomplished and scholarly dramatic critic of the ACADEMY, Mr. Frederick Wedmore, the novelist, whose theatrical notices are perhaps the best in style and the most trustworthy now appearing in any London journal."—*Manchester City News*.

"Our contemporary the ACADEMY has suddenly sprung into a great literary position, and is full of instructive and interesting matter."—*Spectator*.

"The ACADEMY, in its new and enlarged form, has a promising look. Its size is that of the *Athenaeum*, and the general arrangement of its contents does not differ much from that of its venerable and not too enterprising contemporary. The great distinction between the two is that the articles of the ACADEMY are signed. . . . It will be seen that there is no lack of strong names. But strong names will not of themselves float a new paper. The editing, the general tone, the make-up of it are more important, and of these too a good report can be given. . . . Altogether, the ACADEMY is very readable, and bids fair to be a formidable rival to the *Athenaeum*, which, for that matter, it might speedily and easily surpass in certain respects."—*New York Tribune*.

"We can confidently recommend the ACADEMY to our readers. Its price is fourpence, and all its papers and reviews are signed by their writers, whose names have a high position in literature and art."—*London Figaro*.

THE ACADEMY will pursue the purely practical aim of being a guide and source of information to all educated persons.

MESSRS. BAGSTER announce the first volume of a Series of "RECORDS OF THE PAST," being English Translations of the Assyrian and Egyptian Monuments: (with the Sanction of the Society of Biblical Archaeology,) which will be issued from time to time under the editorship of S. BIRCH, LL.D., etc., of the British Museum.

This First Volume is ready, and contains literal Translations of:

- 1.—Inscription of Rimmon Nirari, by the Rev. A. H. SAYCE, M.A.
- 2.—Inscription of Khammurabi, by H. FOX TALBOT, F.R.S., etc.
- 3.—Monolith Inscription of Samas-Rimmon, by the Rev. A. H. SAYCE, M.A.
- 4.—Bellino's Cylinder of Sennacherib, by H. FOX TALBOT, F.R.S., etc.
- 5.—Taylor's Cylinder of Sennacherib, by H. FOX TALBOT, F.R.S., etc.
- 6.—Annals of Assurbanipal, by GEORGE SMITH.
- 7.—Behistun Inscription of Darius, by Sir H. RAWLINSON, K.C.B., D.C.L., etc.
- 8.—Legend of Ishtar, by H. FOX TALBOT, F.R.S., etc.
- 9.—Early Astronomical Tablets, by the Rev. A. H. SAYCE, M.A.
- 10.—List of further Texts, Assyrian and Egyptian. (Selected by GEO. SMITH, and P. LE PAGE RENOUF, F.R.S.L.)

The Volumes are crown octavo: and the Price 3s. 6d. each.
Vol. II. EGYPTIAN TEXTS, will be ready in July.

THE FOLLOWING is a LIST of the TEXTS in PREPARATION for THIS and SUCCEEDING VOLUMES:—

HISTORICAL.

INSCRIPTION of UNA in the Museum of Boulaq. Translated by S. BIRCH, LL.D.

SEPOLCHRAL INSCRIPTION of AMENI; Mention of the Star Sirius, or Dog Star. Translated by S. BIRCH, LL.D.

TABLET of the 400 YEARS referring to the Hyksos Period. Translated by S. BIRCH, LL.D.

ANNALS of THOTHMES III. Translated by S. BIRCH, LL.D.

1. INSCRIPTION of ANKHESI;
2. STATISTICAL TABLET;
3. TABLET of THOTHMES;
4. ORACLE of the LATERAN;
5. BATTLE TEXTS of MEGASTHENES;
6. INSCRIPTION of ANKH-EM-HEB.

ANNALS of RAMESSES II.

1. THE LUXOR ORACLE. Translated by F. CHABAS.

2. THE WARS of RAMESSES II. WITH THE KHIT. The Saller Papyrus. Translated by Professor LUSHINGTON.

3. TREATY MADE BETWEEN RAMESSES II. and KHETASIRA, the Prince of the Hittite. Translated by C. W. GOODWIN, M.A.

4. ANATANI PAPYRUS III. Containing a Description of the Town of Ramesses. Translated by C. W. GOODWIN, M.A.

INSCRIPTION of PIANCHI MER-AMON, King of Egypt in the Eighth Century, B.C. Translated by F. C. COOK, M.A., Canon of Exeter.

INSCRIPTION of NES-HOR, in the Louvre. Translated by PAUL PIERRET, Conservateur Adjoint.

NEAPOLITAN STELE. An Inscription of the Persian period. Translated by C. W. GOODWIN, M.A.

TABLET of AAHMES. Epoch of Darius. In the Louvre. Translated by PAUL PIERRET.

THE TABLET of CANOPUS. Ptolemaic Period. Translated by S. BIRCH, LL.D.

THE TABLET of ROSETTA. Ptolemaic Period. Translated from the text of LETRONNE.

EXTRACT from the TABLET of NEWER-HOTEP. Account of an investiture with the chain of honour. Translated by PAUL PIERRET.

TRAVELS of an EGYPTIAN in Phenicia, Palestine, &c., in the 14th century, B.C. Translated by MM. CHABAS and GOODWIN.

MYTHOLOGICAL.

THE BOOK of the RESPIRATIONS of ISIS. Ptolemaic period. Translated by P. J. DE HORRACK.

THE LAMENTATIONS of ISIS and NEPHTHYS. Translated by P. J. DE HORRACK.

HYMN to AMEN. From Papyrus in the Museum of Boulaq. Translated by C. W. GOODWIN, M.A.

HYMNS to AMEN. From a Papyrus in the British Museum. Translated by C. W. GOODWIN, M.A.

HYMN to the NILE. From a Papyrus in the British Museum. Translated by F. C. COOK, M.A.

HYMN to OSIRIS. Stele at Paris. Translated by F. CHABAS.

THE SACRED DIRGE MANEROS. From a Papyrus in the British Museum. Translated by C. W. GOODWIN, M.A.

MAGICAL PAPYRUS. In the British Museum. Translated by S. BIRCH, LL.D.

SELECTIONS from the PROVERBS of PTAHEPT. From a Papyrus in the Louvre at Paris. Translated by F. CHABAS.

THE TALE of PRINCE SETNA. Translated by P. LE PAGE RENOUF, F.R.S.L.

THE TALE of two BROTHERS. An Egyptian Tale of the period of the 19th Dynasty. Translated by G. MASPERO, Docteur-ès-Lettres.

THE TALE of the DOOMED PRINCE. Translated by C. W. GOODWIN, M.A.

THE TALE of SANEHA. From a Papyrus at Berlin. Translated by C. W. GOODWIN, M.A.

Records of the Past, Vol. I. ASSYRIAN TEXTS, now ready.

Crown octavo, cloth, 3s. 6d.

LONDON: SAMUEL BAGSTER & SONS,
15 Paternoster Row.

Immediately will be published.
PERSIA: ANCIENT and MODERN. By JOHN FIGGOT, F.S.A. Crown 8vo, cloth.

ROBERT BUCHANAN'S POETICAL and PROSE WORKS. Collected Edition. 6 volumes, crown 8vo, cloth, each 6s.

Volumes I. and II., with a Portrait, are now ready. Volume III. will be ready immediately.

NEW WORK BY THE AUTHOR OF "SONGS OF TWO WORLDS."
SONGS of TWO WORLDS. Second Series. A New Volume of Poems. Sm. cr. 8vo, cloth, 5s. [Just ready.]

SLAVONIC FAIRY TALES. Russian, Servian, Polish, and Bohemian. Translated by JOHN T. NAAKÉ, of the British Museum. Cr. 8vo, cloth, 5s. [Immediately.]

KATHERINE SAUNDERS.
GIDEON'S ROCK, and other Stories. By KATHERINE SAUNDERS. Cr. 8vo, cloth, 6s. [Immediately.]

Contents—Gideon's Rock.—Old Matthew's Puzzle.—Gentle Jack.—Uncle Ned.—The Retired Apothecary.

TWO NEW VOLUMES OF THE CORNHILL LIBRARY OF FICTION.

1. **A FIGHT FOR LIFE.** By MOY THOMAS. Crown 8vo, with a Frontispiece, cloth, 3s. 6d. [Just out.]

2. **THE HOUSE of RABY.** By Mrs. G. HOOPER. Crown 8vo, with a Frontispiece, cloth, 3s. 6d. [Immediately.]

HENRY S. KING & Co., 65 Cornhill, and 12 Paternoster Row.

WM. H. ALLEN & CO.'S NEW WORKS.

HISTORY of the WAR in AFGHANISTAN. By JOHN WILLIAM KAYE, F.R.S. Third Edition, in 8 vols. crown 8vo, 26s.

PRIMITIVE and UNIVERSAL LAWS of the FORMATION and DEVELOPMENT of LANGUAGE; a Rational and Inductive System, founded on the Natural Basis of Onomatopoeia. By C. A. COUNT DE GODDESLANCOURT and FREDERIC PINCOTT. 8vo, 12s. 6d.

GRAMMAR of the ARABIC LANGUAGE. By E. H. PALMER, M.A., Professor of Arabic in the University of Cambridge. 1 vol. 8vo, 18s.

[In this work the arrangement is much simplified, so as to exhibit clearly the principles of the language and the correspondence of the various forms. It contains a Treatise on Prosody, and examples.]

INDIAN ARMY and CIVIL SERVICE LIST for 1874 contains Competition Regulations for the Indian Civil Service; Furlough, Medical, Military, and Retirement Regulations of the Indian Army; Pension Funds, Staff Corps Regulations, Salaries of Staff Officers, &c. Issued by Permission of the Secretary of State of India. Price 6s.; by post 6s. 4d.

HINDUSTANI GRAMMAR. By JOHN T. PLATTS, late Inspector of Public Instruction, Central Provinces. 8vo, 12s.

[The work differs from all preceding Grammars of Hindustani. Much that is old is put in a new light. A large quantity of new matter has been added both in the Etymology and Syntax.]

PLATT'S GULISTAN. Carefully collated with the Original MS., with a full Vocabulary. A New Edition, thoroughly revised and corrected, and with all the verses scanned. Royal 8vo, 12s. 6d.

PLATT'S GULISTAN. Translated from a Revised Text, with Copious Notes, and a Life of the Poet. 8vo, 12s. 6d.

THE CLIMATE and RESOURCES of UPPER INDIA, and Suggestions for their Improvement. By Lieut.-Col. A. F. CORBETT, Bengal Staff Corps. Crown 8vo, 6s.

London: 13 WATERLOO PLACE, S.W.

SATURDAY, MAY 2, 1874.

It is particularly requested that all letters respecting subscriptions, the delivery of copies, and other business matters, be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

THE INDIAN ADMINISTRATION OF LORD ELLENBOROUGH.

History of the Indian Administration of Lord Ellenborough in his Correspondence with the Duke of Wellington. Edited by Lord Colchester. (London: Bentley & Son, 1874.)

THE reading public have good reason to be thankful to Lord Colchester for this valuable contribution to our materials of Indian history. The correspondence in this volume is threefold. It consists of Lord Ellenborough's letters to the Queen; of his letters to the Duke of Wellington; and of the great Duke's replies. The first are formal and frigid—of the usual style of ministerial letters to Royalty; the second are characteristic and interesting; the third are equally characteristic, and still more interesting to the general reader.

The book, it is presumed, is intended to illustrate the character of Lord Ellenborough. The reviewer, therefore, whose space is limited, will wisely confine himself to this one subject. The correspondence now given to the world confirms all previous impressions of the greatness and the littleness of this singular man. He was a statesman of rare capacity; but he did very silly things. He was fearless and independent, but there was sometimes a tortuosity in his proceedings, which was uncandid and ungenerous, if not cowardly. At one time he would write and speak, as if he thought only of the welfare and the dignity of our great Indian Empire; and at another time he would display an amount of egotism and vanity unparalleled in persons of either sex. He had a great contempt for his contemporaries, civil and military, and those of the mixed official race known as "politicals." He was wont to speak of old generals being ruled by "boys" in the field—but the boys were mostly of the age at which Lord Wellesley, the greatest of India's Governors-General, superintended the affairs of the Empire. Of the generals in Afghanistan, to whom these remarks upon boy-guidance principally refer, Lord Ellenborough seems to have entertained opinions which may best be described as "everything in turn and nothing long." Of Pollock he writes on April 20, 1842: "General Pollock has carried the Khybur Pass, and his troops behaved beautifully. He seems to be charmed with them. They have recovered their spirits now that they are well led." Of Nott, he writes in June: "I regret to say that in Major-General Nott I do not entertain the smallest confidence as an officer. He is a brave man, but his own troops do not respect him as a general." Of Pollock, who in the meanwhile had relieved Jellalabad, the Governor-General writes in July: "I am doing all that I possibly can to send on to

it (the army) camels and mules; but I cannot make a general, and it wants that more than anything else. . . . If he had any real mind, he would not be in the hands of the boys about him." Having thus deposed Pollock, the Governor-General sets up Nott (whom he had previously traduced) as the model of a general officer: "It is impossible," he writes, "that any officer can have obeyed his instructions from the Government more implicitly than General Nott has done, and I have a much higher opinion of him than of any officer in the service." It was reported in India, more than thirty years ago, that Lord Ellenborough had said, "Nott is a very good general, and a very obedient general too," thus hinting that Pollock was disobedient. And if Pollock had not been disobedient, our country would have been eternally blackened in the eyes of all the nations of the East.

General Pollock determined not to slink out of the country without setting his mark upon the capital, in which the representative of the British Government had been murdered, and recovering the prisoners in the hands of his murderer. If he were influenced in this by the "boy political," George Macgregor (whose great fault in the eyes of Lord Ellenborough was that he had been a favourite member of Lord Auckland's staff), he was influenced wisely; but it was from the "unaided, uninstructed impulses" of the soldier that this manly decision emanated. Lord Ellenborough did not see the force of this, but the Duke of Wellington did. "Great interest," he writes on July 6, "is felt in this country for the fate of the prisoners, particularly for the ladies; and I would incur some risk and some expense to save them, if any such prospect or opportunity should offer." He then points out the danger of endeavouring to recover the captives by force, as the enemy might, in their desperation, be tempted to kill them; and adds:—

"But it does not follow that, because the army in Afghanistan ought not to undertake any active operation, with a view to obtain possession of the persons of the prisoners, its presence in the country may not produce a moral effect and greatly influence the negotiations for an exchange of prisoners, and the surrender of the British prisoners by [to] our general. And I must say that Ghuzni being lost, you will quit Afghanistan with honour if you can bring away the prisoners."

The fact is that the re-occupation of Caubul, from which we had been ignominiously expelled, and the recovery of our British prisoners, formed no parts of Lord Ellenborough's original programme. He never approved or appreciated a measure that had not the impress of his own egotism upon it. His design was that Pollock, having relieved Jellalabad, should return to the British Provinces by the line of his advance, and that Nott should retire from Candahar by the way of the Bolan Pass. All men, now, who give a thought to the subject, shudder when they think of what might have befallen the nation if these crude ideas had been wrought into practice. Those were days when Colonel (Sir William) Sleeman—by no means a boy-political—said that he was "ashamed to look a native in the face." From the humiliations and disasters, which

would have been the natural growth of the Governor-General's own original policy, the nation was rescued by the earnest remonstrances of the Lieutenant-Governor of the North-Western Provinces (Mr. Campbell Robertson) and the resolute disobedience of General Pollock. Lord Ellenborough adopted their views, and ever afterwards hated the men who had so greatly benefited him. It was generally reported in India, at the time, that Lord Ellenborough had said that Mr. Robertson—one of the ablest and the honestest men who ever went to India—was "the greatest fool in the country, except the Bishop of Calcutta." In an unpublished letter now before the present writer, the Governor-General, writing to Robertson, says: "If I save this country, I shall save it in spite of every man in it who ought to give me support; but I will save it in spite of them." And this was written at a time when he was contemplating the withdrawal of our armies from Afghanistan without re-occupying the capital or recovering our prisoners—the surest means of losing the country that could have been devised.

And as to Pollock, mark the results. The Governor-General had so prejudiced the mind of the Duke of Wellington against the general, that his Grace said there was some difficulty in proposing a vote of thanks to the officer, who had saved the nation from disgrace and the Governor-General from impeachment:—

"We should have moved the thanks in the two Houses," writes the Duke, in February 1843, "to the Governor-General and the officers and troops employed in India, on Thursday next, the 9th, instead of on Thursday se'night, the 16th, only that it would be absolutely necessary to bring papers on the table, in conformity with precedent, if we moved thanks to the Governor-General for military services, he not having been himself on the field."

And, presently, he adds: "I am much more uneasy about the thanks to General Pollock, than I am about those to yourself." And this, because Pollock had set his mark upon Caubul by blowing up a bazaar and a mosque. The "military services" of a Governor-General, who had wished the army to slink out of Afghanistan like a dog with its tail between its legs, were to be exalted, whilst those of the general who wished to fight, to conquer, and to rescue—and who did fight, conquer, and rescue—were esteemed in high quarters to be of such dubious quality, that the Duke of Wellington was doubtful about their acceptance by the two Houses of Parliament.

This was an exception to the general sagacity of the great Duke—for the rightful claims of Sir George Pollock to the thanks of Parliament were never questioned, whilst those of Lord Ellenborough were. The great speech of Sir Robert Peel in the Lower House settled the question of Pollock's claims to the gratitude of the nation. But Lord Ellenborough could never get over the affair of the Somnauth Gates. The Duke of Wellington vindicated it as "a song of triumph." In India it was at first believed to be a hoax. I can vouch for the truth of the following illustration. The editor of one of the leading Calcutta journals was at the house of the Principal Commissary of Ordnance in Fort

William, when, just before dinner, some one asked him if there was any news. The answer was that Lord Ellenborough had issued a Proclamation about the Gates of Somnauth. The journalist had received an early copy of it, and a proof had been given to him as he was starting for dinner. He produced it, and read it aloud to the infinite amusement of the party assembled, which comprised some of the chief people of the City of Palaces. As the reader, in his younger days, had been somewhat prone to the production of political parodies, all his hearers laughed at the "Proclamation" as a joke, and some said, "This is the best thing you have ever done!" In vain the luckless journalist endeavoured to persuade his friends that he had not written a line of it—that it was Lord Ellenborough's, every word; and it was not until late in the following day, when the Proclamation was published in the *Gazette*, that their scepticism was finally removed. Then all India laughed at it; some who laughed at it also condemned the "Song of Triumph," but it was perfectly harmless, and the Governor-General afterwards vindicated its publication by saying it had produced no effect. Lord Ellenborough was fond of applying the word "puerile" to others. But Macaulay's "fourth-form schoolboy," in sober seriousness, would have committed no such puerility as this. It is interesting, however, to observe that in Lord Colchester's volume, the anti-Mohammedan enthusiasm of his uncle displays itself in a remarkable manner. He writes to the Duke of Wellington, saying, "I fired forty-two guns for Ghuznee and Caubul; the twenty-second gun, which announced that all was finished, was what overcame the Mahometans." A little before, he writes in the same letter, "I am told that the guns produced absolute consternation, visible in their countenance. *One Ayah threw herself on the ground in an agony of despair.*" This is charming! The pity is that there was no Indian *Punch* at the time to celebrate the "Fall of Islam" in the person of an agonized ayah, with a hair-brush in her hand, in convulsions at her mistress's feet. And this tremendous effect was produced on the minds of the followers of the Prophet because Nott had gone to Ghuznee, and Pollock to Caubul (in spite of Lord Ellenborough), instead of returning by Quettah and Peshawur. The Governor-General took to himself the merit of the overthrow of Mohammedanism by the disobedience of his generals.

These weaknesses and vanities might be forgiven in a man who was personally weak and vain, even though they tended to cast discredit on men who were, fortunately, strong enough to resist anything that Lord Ellenborough could write against them and to go down to posterity, purer and brighter, for what, in his egotism, he chose to write. But the spoliation of Sindh was a great political offence. There is a story told, I think, by Horace Walpole, that a certain nobleman, who, one day, had caned a man, was surprised to find him, soon afterwards, caning another. "I congratulate you," said my lord, "on your access of valour." "Yes," was the answer; "your lordship and I know whom to beat." Lord Ellenborough knew whom to beat. He was con-

tent that the British nation should be chastised by Afghanistan, and straightway set to work to find a weaker State to chastise. Assisted by Sir Charles Napier, he caned the Ameers of Sindh, and reduced them to miserable pensioners. This is the great stain on Lord Ellenborough's Indian career. It was not a vanity. It was a crime. It was justified, somewhat reluctantly, by Sir Robert Peel, who said that "when civilisation and barbarism come in contact," &c., &c.—precisely what Russia says now of her advances in Central Asia. It was the strong sense of the injustice of these proceedings expressed by Major Outram that made Lord Ellenborough hate him with an extreme intensity of hatred and to write evil things of him which Lord Colchester has greatly damaged the reputation of his uncle by reproducing in the volume before me.

I must briefly pass over the important affair of Gwalior, for mere lack of space. Lord Ellenborough on this occasion behaved with great personal gallantry. He exposed himself to the fire of the enemy, and did much to aid and animate his active soldiers and to console the sick and the wounded. It is not impossible, however, that the Duke of Wellington afterwards saw cause to regret what he had written about the "military services" of a Governor-General "not in the field;" for it incited Lord Ellenborough thus to go into action at Maharajpore, and made him very boastful on his return to England. After some time the Duke felt that he could not stand it much longer, and he said, or is reported to have said (the story was current both in England and in India thirty years ago): "Ellenborough, if I were to talk as much about my battles as you do about yours, people would call me a bore."

It is easy to sum up, in a few sentences, the character of the second Lord Ellenborough. He might have been one of the greatest men of our times, if he had not been the vainest. But his genius was rather French than English; and he would, probably, have accomplished a greater career in military than in civil life. He was nicknamed the "Brummagem Napoleon;" but the man whom he most resembled was Murat. Of all epithets that could be applied to him, the most characteristic would be "dashing." Unstable as water, he could not succeed as a statesman. He could not help contradicting himself. He went out to India declaredly to cultivate the arts of peace—and he had no sooner withdrawn from one war, than he launched into a second, then a third, and had his blood up to spring into a fourth, when the East India Company recalled him. His Indian career was the very reverse of his programme. He smote himself on both cheeks with the most heroic self-abnegation, and stultified himself in dust and ashes. Yet, for all this, history cannot deny that he was a man of wonderful ability—or rather, it should be said, of uncommon genius. But it was genius of an erratic kind. He wrote with scholarly lucidity, and I have seldom heard, in any assemblage of English gentlemen—even in the House of Lords, where oratory is so much cultivated for lack of business—any eloquence

surpassing Lord Ellenborough's. But his whole career was a failure, and he went to pieces simply for want of bottom. He carried so much sail, that he fouled upon the rocks, and never got safely into port.

I must repeat at the end of this article what I said at the beginning. The reading public are greatly indebted to Lord Colchester—no one more than myself. For the volume under review has established the accuracy of the facts that I had previously recorded, and the views which I had expressed, as nothing else could have done.

JOHN WILLIAM KAYE.

Lost Beauties of the English Language. An Appeal to Authors, Poets, Clergymen, and Public Speakers. By Charles Mackay, LL.D., Fellow of the Royal Society of Antiquaries of Denmark. (London: Chatto & Windus.) Pp. 322.

THE more careful and enlightened study of our older language that marks the present century and especially the present generation, is undoubtedly producing fruits upon our present speech. Many archaic and provincial words are receiving a recognition of which but a few years ago they would have been thought unworthy. There is every hope that some outcasts will be reclaimed; that "the losses" so much lamented are not altogether irreparable; that certain words, long regarded as dead and buried, are to rise again. And with this hope we have much sympathy. It is most desirable that the vocabulary of our forefathers should not be recklessly forgotten and ignored. The verbal links that bind us to our past are among the most precious of the links that so bind us. To wantonly snap and discard a single one is an impiety done to Nature herself; and so to recover one and reunite us by one more bond is an act of true filial service. In this general sense we welcome Dr. Mackay's *Lost Beauties of the English Language*.

But it is only in this general sense. The book is, in fact, a Lexicon of some 320 pages, compiled mainly, it would seem, from various sources, such as Halliwell's well-known *Dictionary of Archaic and Provincial Words*, the Glossaries of various old romances and poems, Wright's *Provincial Dictionary*, &c. Of course, it is impossible that such a collection should be uninteresting, especially for those who are not acquainted with the sources drawn from. It is well that the results of more thorough works should be popularised; and we thank Dr. Mackay for having made an effort in that direction. But we fear this is all the thanks we can give him.

The real purpose of the volume is to further that revival of older words to which we have referred. The Introduction strongly urges it; "the appeal" mentioned on the title-page is in behalf of it; the word-list itself is formed and published with a view to facilitate it. But we doubt whether Dr. Mackay will do more good or harm to the cause which he has at heart. He seems to have but an imperfect comprehension of the history of our language. He takes upon himself to correct Spenser, who calls Chaucer

"the well of English undefiled." "If we really wish," he says, "to discover the true 'well of English undefiled,' where the stream runs clear and unmixed, we must look to the author of *Piers Ploughman*, rather than to Chaucer." Now, what does Dr. Mackay understand by the term "English"? We suspect he has not grasped the sense of the term he uses so confidently. And what is his acquaintance with *Piers Ploughman*? It is evident he does not know this indisputable fact: that *Langland* "employs Norman-French words freely whenever he wishes to do so." The revival of old words can only be achieved by the exercise of a careful judgment, and a proper consideration for all the traditions of our language. It is absurd to spite any particular element of what is essentially compound. One is reminded of the old fable of Menenius Agrippa. One might as well spite one's own forehead, or try to develop one's chest at the expense of the shoulders. Moreover, Dr. Mackay's list is far too indiscriminate. It is the list of a revolutionary rather than a reformer. Does he really hope that "the Authors, Poets, Clergymen, and Public Speakers" to whom he "appeals," will adopt his resuscitations? Among them there are, we think, several that deserve consideration. A shorter and well-selected list might be of real use. But, unless every churchgoer is provided with a *Glossary Ancient and Modern* as well as the *Hymns* and the *Prayer-book*, we do not see how at present, in case of Dr. Mackay's suggestions penetrating to the pulpit, there could be any satisfactory communication between the pastor and his flock. Perhaps a few interpretations might be given in fresco in a conspicuous part of the church, or the vergers might be made into a sort of philological "sandwiches," or any special difficulty might be "looked out" in the curate, or in a well-edited and neatly-bound churchwarden kept chained to the lectern for the purpose; but certainly there would often be obscurity, especially when the speaker had plunged deep into "the clear and unmixed" stream we have heard of, and come up saturated and dripping. Conceive any orator, in our present benighted condition, talking of a "niding," or a "nimster," or a "knoppe," or a "bummel." In such a profuse and unsifted catalogue the chance of such members of it as might reasonably have looked for acceptance is seriously reduced.

It is also to be regretted that Dr. Mackay should have meddled with etymological and kindred questions; for the result is anything but satisfactory. We have already seen reason to suspect his knowledge of the history of the English language. The fact is, that the more we read him, the more we suspect him. He speaks of "the languages of modern Europe that have sprung directly from the Sanscrit and Celtic." What can he mean? Is there any language whatever of modern Europe sprung directly from the Sanskrit? Does not "every schoolboy" know that the real relation of Latin and Greek to the Sanskrit is not filial but sisterly? Again: "The English, so far as it remains an Anglo-Saxon tongue, is derived from the Low German, with a mixture of the Scandinavian and Icelandic; while the Lowland Scotch, or Scoto-Saxon, is

indebted more immediately to the Dutch, Flemish, and Danish, both for its fundamental and most characteristic words and for its inflection and grammar" (Introd. p. xiv.) To leave alone other points, is it possible that Dr. Mackay does not know that Dutch is Low German? In another passage (p. xv.) it is only too clear that he does not know that Dutch and Norse are Teutonic. Further on, he assures us that Gaelic is "indubitably a branch of the Sanscrit"! To turn for a moment to details, he puts the plurals *men* and *women* in the same category with "oxen" and "housen." It would appear, after all, that he is a devotee of Gaelic rather than of "Anglo-Saxon;" for it is from the Gaelic he derives *bailie*, *grove*, *grieve* (a bailiff), &c. When will the world learn that Etymology is a science, and not mere guesswork? We are told that "egg" in "to egg on" is a "corruption" of "agg," where the fact is just the opposite!—that "beck" is "derived from the German *Bach*"!—that the Scotch *bir* is derived from the Latin *vir*!—that *boon* a substantive and *boon* the adjective are one and the same word!—that *brimful* is probably a "corruption" of *rimful*! &c. &c.

We wish we could have spoken otherwise of this book. But we too love that old language of which the author makes himself the champion, and cannot but vent our remonstrance when we see the defence and illustration of it undertaken by hands scarcely competent for so high an office.

J. W. HALES.

Verfassung und Demokratie der vereinigten Staaten von Amerika. Von Dr. H. von Holst, a.o. Professor an der Universität Strassburg. I. Theil: Staatensouveränität und Sklaverei. (Düsseldorf: Julius Buddeus. New York: E. Steiger.)

THE 436 pages of the present volume comprise but a fraction of the work on the "Constitution and Democracy" of the United States, which Professor von Holst has undertaken; and since he informs us that this first instalment of it has cost him five years' labour (a statement which may well be considered as authenticated by internal evidence), it becomes almost appalling to look forward to the distant future in which his task may eventually be completed. The whole work, he tells us, will be divided into three parts: the first embracing the internal history of the United States, so far as may be desirable for the development and understanding of their constitutional law and democratic polity; the second devoted to their constitutional law itself; the third to their "actual political and socio-political condition,"—which last, indeed, one cannot help feeling, may have become very different by the time the work is finished from what it is now. But the first volume, now presented to the public, only extends to the compromise with South Carolina on the Nullification or Tariff question in 1833; and considering the far greater importance in a constitutional point of view of the subsequent period of American history, it seems difficult to believe that this first part of the work can be completed in less than three volumes; so that if we allow the same bulk to each part, the whole would

comprise some nine volumes. Carried to such large dimensions, one fears that, whatever may be its merits, it will have but little effect in instructing the public opinion of Europe in its important subject.

It follows necessarily from what has been said above that Professor von Holst's work is a thoroughly painstaking one. Its fulness is truly German; there is probably no American statesman who would not learn something from it. This very fulness is, however, one of its main defects: one fails to see the wood for the trees, so overwhelming is the abundance of its details. Another defect in it is that it presupposes too much knowledge in its readers. No one can attempt to study it with profit who has not already a good knowledge of the facts of American history, and is not familiar with its leading personages. Had the author accompanied his work with a sketch of the general history of the United States, he would have perhaps decupled the number of his European readers. As it is, few but Americans probably will be able to follow the work with the interest which its real ability deserves. To the same cause must probably be attributed the singular circumstance, that sometimes the most important documents are those which occupy the least space. Possibly a full consideration of the Constitution itself may be reserved for the second part of the work, but a somewhat complete summary of it would seem the necessary starting-point for the "internal history" of the United States; yet whilst a very able chapter is devoted to the "canonizing of the Constitution," and certain articles in it are copiously dwelt upon, such a summary is nowhere to be found. So again at the close of the volume, in the account of the Nullification controversy, whilst considerable space is devoted to Calhoun's address to the people of South Carolina, to his letter to Governor Hamilton, to the proceedings of the Governor and Legislature of the State, a single reference to Jackson's "celebrated proclamation" on the other side, with a discussion in a note as to its authorship, is considered sufficient; whilst not a word is quoted from Jackson's subsequent Nullification message or his second Inaugural, which both carry on with singular power the argument against state-sovereignty. In this case, indeed, the omissions may be owing to the habitual depreciation in which Jackson's statesmanship has been held by European writers, who have mostly followed Tocqueville's lead, although Professor von Holst himself correctly points out the superficiality of the latter's *Démocratie en Amérique*, especially as compared with his truly weighty and searching *L'Ancien Régime et la Révolution*. But at any rate, such a mode of treatment, by a too scholarly exclusion of the facts and documents which are supposed to be best known, greatly impairs the breadth and massiveness of the work, and prevents it from standing foursquare on its own ground, as a really great book should do.

One cannot, indeed, help doubting whether Professor von Holst has not diminished the value of his work, as he certainly has damped its interest, by the analytical treatment which he has applied to it. After one has followed at great length the history of the question of state-sovereignty as far as the Hartford

Convention in 1814, it becomes tiresome to go back to the very beginning of the Republic in order to take up that of the Slavery question. In reality, this latter question has underlain all others, however far buried out of sight, from the very foundation of the Union; but for the opposition of interests between slave and free, the doctrine of state-sovereignty would never have needed to be seriously put forward. Not that that doctrine has been one peculiar to the South, as indeed the Hartford Convention alone proves, and as Professor von Holst shows by many evident instances; but that no other local interest than that of slavery could ever have been strong enough to balance the vitally paramount interest of union with the other States of the federation. Hence, to the close of the Civil War, the guiding thread of the historian of America should from the first be the sense of the bearings of that question on the politics of the day, even when their issues lie apparently most remote from it.

Another defect in Professor von Holst's treatment of his subject lies in his shutting himself up too exclusively in what may be called the State-paper world. Unless I greatly err, there is no mention anywhere in his volume of "General Gabriel's" rebellion in Virginia in 1801, when the coloured people, armed with scythes, attempted to take Richmond, the rebellion giving rise to the permanent institution of a public guard in the city. Yet who does not see that an event like this gives terrible point to the whole discussion of the slavery question in following years, and puts, for instance, in quite a different light, words like those which he quotes of the North Carolinian Macon in the debate on the mode of dealing with negroes seized on board of slavers in 1808: "It is in vain to talk of turning these creatures loose to cut our throats." Many a time, indeed, in going through these often acute and always able pages, one cannot help longing for a few of those touches of fact which cast, as it were, an electric light through a whole controversy. Professor von Holst quotes, not unfrequently, Benton's "Thirty Years' View;" in treating, as he does at length, of Calhoun's Nullification movement, why has he not found space out of Benton's pages for that striking scene at the Jefferson banquet of April 13, 1830, when, surrounded by Nullificationists, Jackson, called on for a toast, gave "Our Federal Union: it *must* be preserved;" whilst Calhoun, his Vice-president, retorted with "The Union; *next* to our liberty, the most dear. May we all remember that it can only be preserved by respecting the rights of the States, and distributing equally the benefit and burthen of the Union." Surely the whole coming struggle between the two men is prefigured in the antagonism between their two toasts.

It has been before intimated that Professor von Holst appears to underrate Jackson. It is probably owing to this that he omits all mention of his struggle with the United States' Bank. Yet surely the question involved in it was one of the gravest constitutional nature, and big with issues affecting the whole future of the United States, viz., whether a money-power of national dimensions should be allowed to subsist, which

took part in political warfare, set at nought Government control, and seized the dividends on the public stock. How momentous such a danger is in a Republic, from the want of all those countervailing influences which other forms of government may supply, the instance of the Erie Ring shows, which but the other day we saw controlling the legislature and half the judiciary of the "Empire State" of the Union. If James Fisk's mammonocracy was confined to a State or two, it was probably thanks only to the toughness of "Old Hickory," which, forty years before, had thrown Fisk's precursor, Nicholas Biddle, in that previous wrestle, wherein the control of the Union itself was at stake.

It is, moreover, at least a question whether the constitutional history of the United States can be thoroughly intelligible without some previous consideration of the colonial history of the States themselves before either union or confederation. Professor von Holst somewhere excellently remarks that the only real bond of union between the States at the first was that they had all been alike subject to England; that until the rupture with the mother-country was complete, their citizens were first the children of their respective colonies, then Englishmen. It appears singular that, recognising this fact, it should not have occurred to the author that it must be important to determine what it was to be a South Carolinian or a Virginian, a New Englander, New Yorker or Pennsylvanian, in order to understand what might help each of them to grow into an American, or hinder him from doing so. Is there nothing that throws a light on the prominent part played by one of the smallest of the slave States on any occasion of opposition to the general Government, from Nullification in 1832 to the bombardment of Fort Sumter in 1861, in the fact that the colony of South Carolina first emerges into history (1670) as refusing to accept the Constitution devised for it by Shaftesbury and Locke, and that for over twenty years the struggle lasted, till in the end the Constitution was formally set aside? Is there nothing that explains the unity of spirit which on such occasions has prevailed in its counsels in the peculiar concentration of political power in its legislature, which alone among the States of the Union has had the privilege of naming both the Governor of the State and its presidential electors? Conversely, is there nothing in the fact that the political life of New England begins with a solemn voluntary compact, with the famous "instrument" signed on board the *Mayflower*? Speaking broadly, when we observe that the North was colonised by religious faith, the South by the spirit of adventure, do we learn nothing from that towards judging of after times? Is there no lesson to be drawn from the record of the repeated projects, more or less realised, of confederacy which proceeded from the North, whilst there was nothing to correspond to them in the South? from the tenacious attachment of Massachusetts to its charter, compared with the repeated changes in the political constitution of Virginia during the colonial period?

There is yet another point on which

Professor von Holst has hardly come up to the mark of what might have been expected of a writer so painstaking. He speaks somewhere with great contempt of English writers on American history, and follows up that contempt by an almost total absence of reference to them, except to some small extent for the revolutionary period. Surely Professor Cairnes's *Slave-Power* was not a work to be entirely passed by, and indeed works of a more popular character might be named which, although their pages are not rich with references to Elliot's *Debates* and Niles's *Register*, might yet have been read by the learned professor not without profit.

Errors of fact there are probably few, although one rather serious one may be pointed out, where from the apportionment of representation to the slave States, under the Constitution, by adding "to the whole number of free persons . . . three-fifths of all other persons," i.e. of slaves, Professor von Holst draws the conclusion that the vote of the possessor of fifty slaves was made equivalent in weight to that of thirty freemen. This is a wrong inference. The mischief of the enactment lay far deeper. Had the slaveholding whites of the South enjoyed the privilege of voting individually in right of their slaves, slavery would have had no worse enemies than the Southern non-slaveholders, the "mean whites." It was the voting power of the State at large which was increased by this enactment, and not that of the individuals. At the polls the non-slaveholder was the equal of his wealthiest slaveholding neighbour, and had the benefit of the latter's slave property as against the Northerner; so that, if we suppose the required quota for a representative to be 50,000, 160 slaveholders owning on an average 500 slaves each, or 80,000, and 1,840 mean whites without a slave, or 2,000 Southern freemen in all, would equal 50,000 freemen of the North. This is the secret of the singular pride which nearly the whole white population of the South felt in the "peculiar institution," and of their really heroic fight for the privilege of being ruined and degraded by it. It beggared them socially; politically, it made them equal members of an aristocracy.

To sum up, Professor von Holst's mode of treating his task, however ample in its elaboration, seems to want thoroughness of insight and completeness of survey. In offering such a criticism, one is of course bound to make every due reservation with reference to the fragmentary shape in which the work has begun to appear; what seems as yet to be wanting may no doubt, from the author's point of view, be only postponed. On the other hand, the fragmentary shape of the work restrains the critic from dwelling upon a feature which, if the end is to answer to the beginning, might prove its gravest blot. So far as it has gone, it certainly looks as if it were designed to show only the weakness of the American Constitution—which is no doubt real, and deserves to be fully set forth—and not also its strength, which has proved itself as real, by weathering the crisis of a civil war such as the world never saw. It is easy to make game of the "canonizing" of that Constitution.

Fourth of July orations are certainly by this time as unreal as the paper sacrifices burnt by the Chinese to propitiate the spirits. But one should also recognise the fact, that below all this frothy effervescence of mock-patriotism there lies a deep, true loyalty, transferred from the persons of English sovereigns to the supreme law of the country, and neither deaf to the teachings of the age nor incapable of applying them, which is the very backbone of American greatness.

J. M. LUDLOW.

Teresina Peregrina; or, Fifty Thousand Miles of Travel round the World. By Thérèse Yelverton (Viscountess Avonmore). In Two Volumes. (London: R. Bentley & Son, 1874.)

WE are rather at a loss to know in what terms to express a decided opinion with regard to this work; in fact, we are puzzled to see its *raison d'être*, and can only account for its appearance on the supposition that the *accœthes scribendi* was too strong for the writer. The style is peculiar and generally unfeminine; the grammar is uncertain; and yet withal we cannot deny that the book is often very amusing, although there is scarcely any depth of information in it. It is not, however, a work that we would place in the hands of unsophisticated youth of either sex, for the cool way in which the writer goes, with perfect calmness, into delicate matters which a man would hesitate to name or even hint at, is somewhat astounding.

If the writer has really been to all the places of which she speaks, she has certainly performed a feat which, for a lady, is almost, if not quite, without parallel. But a little short of half her 50,000 miles of travel was performed in the United States, and to this portion she devotes less than sixty pages; but from various indications in other parts of the book, we gather that she did not carry away with her a very exalted opinion of the manners and customs of our cousins on the other side of the Atlantic. She visited Salt Lake City, and was pleasantly disappointed in her preconceived ideas respecting the Mormons and their institutions, for she took quite a fancy to them. She "attended the Tabernacle" on Sunday and heard Brigham Young preach, and she also went to the theatre, which is "the finest building in the city." We are next taken to the Yosemite Valley, "the grandest feature of American scenery," and the reader will regret that a more detailed description is not given of the stupendous mountain peaks and waterfalls to be found there. The account of the various and variegated costumes of the lady visitors to the Valley is one of the most amusing passages in the whole book. On leaving America the writer visited the Sandwich Islands, and then crossed over to Hong-Kong in a Dutch sailing vessel, arriving just in time to witness the disastrous effects of a violent typhoon.

Until we perused these volumes, we were not aware that brief visits to Canton, the British colony of Hong-Kong, and the Portuguese settlement at Macao were sufficient to constitute a claim to have travelled through China! Such, however, is the position which our author takes up, and we cannot be sur-

prised that, with her very limited experience, Chinese houses of the better class are a puzzle to her; but she manages to hit off the orthodox native way of drinking tea correctly enough in the following sentences:—

"Tea is instantly presented; a small copper saucer, a teacup of fine china, and the china saucer reversed on the top of the cup. You take the copper saucer in one hand, press the upper saucer with the other, and sip the tea from between the cup and saucer, the latter preventing the tea leaves from passing into the mouth. . . . (the tea) is taken without sugar or cream."

Though she witnessed several marriages, the writer failed to discover the binding part of the ceremonial, which, we may remark, is believed to consist in the bride and bridegroom pledging each other in wine, and paying obeisance to their parents (or to their tablets, if they be dead). Our author—who throughout the work never loses an opportunity of insisting upon the bad treatment of the weaker by the stronger sex—is evidently pleased to find that "the virtuous conduct of a woman through a long life is more highly honoured in China than in any other country. Temples are raised in honour of virtuous women, as in other countries monuments are erected to heroes."

We fear that the Hong-Kong community will hardly be flattered at the description of their New Year's customs, from which the writer was glad to escape to Macao, where, of course, she visited the garden and grotto of Camoëns, moralising at some length over the poet's sad fate. Owing to an accidental meeting with a French traveller at Macao, she was induced to go to Saigon, and starting from that port, after many troubles and adventures in her journey through the kingdom of Cambodia, she eventually reached the famous Angkor ruins, alluded to in Carné's travels. The chapters in which this expedition is described, are, on the whole, the most interesting and amusing in the book, and we cannot but admire the pluck and perseverance which enabled a woman to undertake such a journey and carry it to a successful termination.

We next come to Singapore, which at first the writer thought presented no very striking features, and no doubt it must have seemed a humdrum place after her recent adventurous exploits. She is, nevertheless, forced to admit that the beauty of the roads—of which a pleasing recollection lingers in our own memory—is not easily surpassed. She made friends with the Rajah of Johore, and paid a second visit to his realm for the purpose of seeing the gold mines of Chindras, at the foot of what she considers to be the ancient Mount Ophir; and, what with tigers and convict companions, she must have had an exciting time of it. During her stay in Borneo she visited some places where we can well believe that a foreign lady had never been seen before; but it would be impossible to follow her through her wanderings in that quarter, though we may mention that, when she was in one of her strange abiding places, a Dyak youth "used to steal up generally with the shadows of the moon, and discourse sweet music from a species of pumpkin and half-a-dozen bamboo reeds!"

One of the weakest chapters in the whole work is that on the "Coolie Question," and

some of the assertions in it are so manifestly untrue, that they materially shake any confidence we might otherwise have in many of the writer's statements. The author clearly approves of the detestable coolie trade, and endeavours to paint a pleasant picture of its results. "The coolie," she asserts, "is better off than our British labourer, who has very little more wages!" Now the coolie, be it remarked, earns *five* shillings a week, and, by the writer's own showing, is liable to be flogged at his master's pleasure: and may even be so treated as to have no escape, save in suicide, from the intolerable wretchedness of his condition. We fail to see that the writer betters her case by pointing out that the coolies are no worse off than the Malay sailors on board of foreign vessels "on the China coast and archipelago." In doing this, she incidentally advances the extraordinary dogma that "the ships must be sailed by these men, who alone know the coast." We cannot conceive what the writer can be aiming at in making such a statement, unless it be to exhibit her ignorance and destroy her credit. Some ships, of course, on the coast of China have crews composed in part of Malays, but we need hardly point out that these Malay sailors have absolutely nothing to do with their navigation. To another assertion of the writer's we must take the gravest exception. Speaking of an endeavour to keep the coolie traffic under some sort of control, she observes:—

"A British Consul at one of the British sailing ports proposed that every coolie should, before embarking, be brought to the Consulate, and questioned as to his desire—for which the fee was to be one dollar. Not a bad idea of the Consul's to increase his own receipts about a thousand or two a year, by seeing that the coolie got British protection!"

On this we would observe, with all deference to our author's superior information, that there cannot be a British consul at a British sailing port (whatever that may be), and we must suppose that she really refers to one of the treaty ports of China at which Consular officers are stationed. If that be the case, her insinuation about fees is a gratuitous insult to the Consular Service in China: for, of our own personal knowledge, we can affirm that all fees are accounted for to her Majesty's Government. For our own part, we trust that the coolie trade has received its death-blow since this work was published, for, as has been already noted in these columns, it was abolished on March 27 at Macao, a place which had long boasted an unenviable notoriety as the headquarters of this abominable traffic.

Passing over the chapters on the Indian Archipelago and the Battaks, in the latter of which the writer relates some disgusting stories, we come to that on Ceylon. In this she makes a statement which we believe to be utterly and entirely devoid of foundation. Speaking of a festival in honour of the tooth of Buddha, she says:—

"Formerly the high priest was associated with the King at the ceremony; but since the island and the tooth have fallen into British hands, it is, of course, the Governor standing in lieu of the Queen. With subsidiary priests, private secretaries, aides-de-camp, and attachés, &c., they enter

the *sanctum sanctorum*, where this singularly long tooth dwells in costly obscurity."

In conclusion, we need only add that, after some wanderings in Ceylon, our author eventually "arrived in Gibraltar *viâ* the Suez Canal;" thence made her way through Spain, meeting with some adventures among the Carlists; and finally completed her tour of the world at Paris.

EDW. DUFFIELD JONES.

TWO WORCESTERSHIRE BOOKS.

1. *Illustrations of Old Worcestershire Houses, drawn and etched on Copper.* By W. Niven, Architect. With Notes, historical and descriptive. (London: Printed for the Author, 1873.) Folio.
2. *The Heraldry of Worcestershire, with Genealogical Notes.* By H. Sydney Grazebrook, of the Inner Temple, Barrister-at-Law. (London: J. R. Smith, 1873.) In Two Volumes, 8vo.

SINCE the publication, in 1781, of Dr. Nash's ponderous but incomplete *History*, very little has been done towards illustrating the antiquities of Worcestershire. Dr. Prattinton's valuable collections still remain in manuscript, and up to the present date the Harleian Society has not undertaken to print any of the Heraldic Visitations of the county. We therefore welcome the volumes of Messrs. Niven and Grazebrook as evidences of an awakened interest in matters which have been too long neglected. During the last century many a goodly mansion has fallen a victim to decay, or to the scarcely less destructive process termed "restoration," and one result has been that Mr. Niven's art has been exercised upon far fewer subjects than might otherwise have been the case.

His volume contains twenty plates, executed with great delicacy and care, and accompanied by a few notes, chiefly extracted from Nash's *History* and other patent sources of information. He has nothing new to tell us about the picturesque buildings which he has delineated, unless it be to remark upon the ruthless manner in which stucco and rough-cast have been applied to walls rich in architectural details. In this way the timbered houses of Earl's Croome and Areley Hall have lost their chief beauty, and the castellated mansion of Ham has become, externally, as insignificant as a modern villa.

At Grafton Manor, once the grand seat of the Talbots, a happier taste has permitted the beautiful Renaissance porch to be incorporated in the modern mansion; and both Eastington, the earliest timber house in the county, and Birts-Morton, where Wolsey once was chaplain, still retain most of their characteristic features. With Witley Court it is otherwise. The present Italian house harmonises well with the lovely gardens by which it is surrounded; but we regret that it has supplanted an Elizabethan mansion, which might have been remodelled so as to rival Longleat or Montacute. Henlip Hall exists only in name. The old irregular building, which sheltered in its secret passages the authors of the Gunpowder Plot, was pulled down some forty years ago; and scarcely a vestige remains of Hampton Lovet, "a veri goodly howse," where the

Pakingtons used to dwell, and from which the newly-created peer has taken his title. However, Westwood Court, the more modern seat of the family, still stands in undiminished beauty, and in delineating its choicest features, Mr. Niven has achieved his greatest success and left little or nothing to be desired. In these views, and scarcely less so in those of Meer Hall, Pirton Court, and Severn End, the artist has proved to our satisfaction that none of the modern processes by which sketches are reproduced can compete with the old-fashioned copper-plate.

Mr. Grazebrook's volumes relate to a wholly different sphere of antiquities, and one which is scarcely likely to be as generally attractive. Yet Heraldry may rank among the handmaids of History, and unquestionably is often of the greatest service to the topographer and genealogist. Mr. Grazebrook has, we think, done wisely in keeping himself free from any rigid definition of what constitutes a Worcestershire family. Had he applied Mr. Shirley's severe rule, his labours would soon have had an end, for, of those landowners who entered their descents in the years 1530 and 1569 (when the Heralds made their first visitations), only three have now a direct representative in the county; and perhaps no part of England underwent greater changes at the suppression of monasteries than Worcestershire. Mr. Grazebrook, therefore, in his desire to make his book extensively useful, has opened its pages to all persons and families whom, in the course of a laborious search, he has found to have identified themselves in any way with the county. Accordingly, we have Actons, Blounts, Talbots, and Lechmeres intermingled with *novi homines* whom it would be invidious to name, and the result is a valuable contribution to the gentilitia history of Worcestershire, and one which contrasts very favourably with the careless compilations of the Rev. F. W. Kittermaster and others.

Mr. Grazebrook is no mere copyist, but evinces much critical acumen, not only in the detection of error but also in the discovery of truth, and every page of his work shows that he has spared no pains to render it complete and accurate. The quotation we subjoin will give the reader a fair idea of the plan which Mr. Grazebrook has adopted:—

"Bagshaw of INKBERROW.—A pedigree of this family was entered at the Visitation of 1682-3; it commences with Arthur Bagshaw, of Rush in Inkberrow, gent., who paid a fine for refusing knighthood at the coronation of Charles I., and who is stated to have died in 1643, aged 105.—A bugle horn between three roses. (Disallowed at the Visitation.)

"Mr. Bagshaw produced a gold seal of these arms, which he says was his great-grandfather's, but they are the arms of the Bagshaws of Ridge and Farewell, co. Stafford. C. 4, 40. Vinc. Staff. 107." (Note in the *Visitation Book*, K. 4, Coll. Arm. fo. 51.)"

It should be added that Mr. Grazebrook has resorted for information not merely to Heraldic Visitations and ancient manuscripts, but also to church monuments and trustworthy personal sources.

The title of his book is perhaps unnecessarily modest, for its contents have almost as much to do with the Genealogy as with the Heraldry of Worcestershire.

CHARLES J. ROBINSON.

NEW NOVELS.

Lady Anna. By Anthony Trollope. (London: Chapman & Hall, 1874.)

Half a Life. By George Webb Dasent, D.C.L. (London: Chapman & Hall, 1874.)

Ingram Place. By a Cape Colonist. (London: Longmans & Co., 1874.)

Johnny Ludlow. (London: R. Bentley & Son, 1874.)

Through the Mist. By Jeanie Hering. (London: Virtue & Co., 1874.)

Claude Meadowleigh, Artist. By Captain W. E. Montague. (London: Hurst & Blackett, 1874.)

IN reviewing any novel of Mr. Anthony Trollope's, one must either write a very long notice or a very short one. Probably in the case of *Lady Anna* the latter will be the more appropriate. If Mr. Trollope were to write a novel in his sleep, or while talking to miscellaneous people, or under the influence of an unbroken series of bilious headaches, it would no doubt be amusing and readable; consequently it is unnecessary to apply these epithets to *Lady Anna*. And as we have high authority for believing that vessels of humbler materials than gold and silver are tolerable and necessary in a house, the present work may be allowed to take its place without much question by the side of *Barchester Towers* and *Orley Farm*. There is a foolish and unpleasant parson in it, but then in return there is at least one very pleasant lawyer. Mr. Trollope probably counts upon a rush of wigs and gowns and blue bags to save him from the traditional fate of being torn in pieces by wild curates. In the last sentence we are promised some further account of the heroine and her husband, Mr. Daniel Thwaite, the tailor. The promise is welcome; but we should like to ask Mr. Trollope a favour. He is fond of immolating one of each pair of turtle doves who have figured in his tales. It would be an immense relief if Daniel Thwaite were sent to the *lugentes campi*, to seek the company of John Bold and Mary Flood Jones.

The most decided impression which *Half a Life* produces on the reader is this, that it ought to be a very much better book than it is. Nor is it obvious at first where the fault lies, or what it is that makes the story halt and drag, and wearies the reader notwithstanding a very tolerable style, and material attractive and varied enough of its kind. But one perceives before very long that it is, in fact, not one book, but a conglomerate. It tries to be a handbook of London forty years ago, a chronicle of the humours of Westminster, an Oxford guide, and a collection of Berkshire folk-lore all at once; and interwoven with all this there is the strangest series of notices of John Sterling, who is called Mr. Chrysostom, but is identified beyond possibility of mistake by allusions to his family, friends, and places of sojourn. The central stream of fable, which has to dissolve and assimilate all this miscellaneous matter, is of the feeblest description, and quite unequal to the task, so that the whole result is heavy and incongruous to an extraordinary degree. It is autobiographic in form, autobiography appearing to have a singular moth-and-candle attraction for novelists, and the hero is maudlin

and uninteresting even beyond his fellows. The only character in whom it is possible to take the least interest is a certain Honora Tailby, who is no favourite of the author's, and is introduced merely as a foil. We have seldom read a more undigested and indigestible book; and we cannot help regretting that Dr. Dasent should have wasted much good English, plenty of promising material, and not a little amusing anecdote upon so crude and unsatisfactory a production.

It has not been possible to bestow unqualified praise on either of the two books hitherto mentioned, but in passing from them to others we cannot help feeling as though we had been guilty in our censure of the crime of "sinning our mercies." Mr. Anthony Trollope may have written better novels than *Lady Anna*, Dr. Dasent may have produced literary works more worthy of him than *Half a Life*; but at any rate we feel tolerably safe in the hands of either from the novel-critic's blackest beasts, absurdity and bad English. This pleasing confidence is not by any means always with us, and we must confess that it deserted us altogether when, at the fourth page of *Ingram Place*, we came upon an Irish tramp, who, being possessed apparently of three hands, and a double portion of the ubiquity of his country's birds, arrests somebody else's hand, severs a bell-rope with a sharp knife, and locks a door "at the same instant." It would not be fair, however, to judge a "Cape Colonist" entirely from this unlucky passage. He writes very fair English—we beg his pardon, Irish—and is not without ideas both of plot and character. But there is a curious incoherence of place and time about his story, and his personages do some of the very oddest things. Being Peers and Lord Chief Justices, they seem to have the power of altering passed sentences at their pleasure, and setting free convicted prisoners; they are in the article of death by cholera one day, and cheerfully pay visits to their friends the next; they hear of England's going to war first from a "foreign paper" (we are not sure that this does not refer, in an outburst of patriotism, to the *Times*), and they pass their time in refusing blue ribbons, and correcting the misquotations of Royal Highnesses. The Cape Colonist incidentally informs us that "perhaps only a Celt could have appreciated to the full the privilege of being assaulted by the polished shafts of a mighty intellect," and that "an ordinary Saxon can have no conception of" this sort of thing. We are inclined to agree with him.

Most people who have read the pleasant papers which have appeared from time to time in the *Argosy* under the signature of "Johnny Ludlow," will be glad to see them collected; and anybody who has not yet read them had better do so without loss of time. There is nothing at all ambitious about them; on the contrary, they are decidedly parochial in tone and character—in fact, small beer. But any one who, like ourselves, is unheroic enough to confess to an occasional remembrance of the poor creature, will find in them a pleasant and healthy brew. They are written from the stand-point of the provincial Philistine, and it would be hard to find a happier touch

than, for instance, this, said of a neighbouring millionaire: "I think he was more to some of us than *Prince Albert*!" The volumes contain nearly thirty stories, more or less unconnected, and it is of course impossible to give any detailed account of them. As particularly good may be mentioned "Major Parrifer," an Ahab, who, stoning being out of fashion, gets Naboth sentenced to a month's imprisonment for working on Sunday, and meets with rare poetical justice; and "Going to the Mop." There are some ghost stories, which are not quite up to the mark. A good ghost story is an excellent and admirable thing, but it is not given to every one to write it.

Ingram Place is a very Irish book, *Johnny Ludlow* is altogether English, it is therefore only fair that Scotland should have its turn. And *Through the Mist* is as Scotch as its title. Indeed, the authoress seems to be imbued, unconsciously perhaps, with a truly North British conviction that the majority of Englishmen are fools or rascals, and the majority of Englishwomen dolls or shrews. But she has managed to write a very agreeable novel to illustrate this general notion, and therefore we shall not waste time in useless protests. The scene opens in the island of Arran, where a young Englishman, Maurice Ingram, becomes accidentally acquainted with a family consisting of two aunts and two nieces. With one of the latter—Dulcie Duncan—he falls in love, and as the course of love does not run quite smooth, elopes with her. They are married, and the two families, his and hers, reconcile themselves without much difficulty. Now it so happens that Maurice has been rather a scapegrace, and in particular has suffered from a terrible attack of *delirium tremens*. This he himself not unnaturally, and his family most unfairly and unwisely, conceal from Dulcie. About a year after the marriage he has an accident, is dosed with brandy, soon afterwards has a series of relapses into his old complaint, and finally flings himself over the balusters and is killed. Everybody marries everybody else, and Dulcie at last consoles herself with an elderly artist, Harold Pierrepont, in whom an under-thread of interest has been kept up throughout. The first half of the book—the Arran scenes—is excellent; the four ladies of Tigh-na-Bienne are all charming and uncommonly well drawn; but the latter part does not show equal skill or familiarity with the subject, and is indeed a little repulsive. *Delirium tremens* is certainly not a nice disease, and by no means so interesting as, for instance, consumption; but a man may have suffered from it without being guilty of every vice and capable of every crime. And the unfortunate Maurice is not only in a manner forced into his relapse, but no one seems to try or know how to get him out of it. It is surely hard on any man—even an Englishman—to be hustled out of the world so unceremoniously, and reviled so heartily by his creator, as Maurice Ingram is by Miss Hering. Still, the book is on the whole a decidedly good book, and had we space we should like to dwell on some of the Scotch scenes.

Claude Meadowleigh, Artist, notwithstanding its title, is what may be called a military novel. This is a class of book which seems

to be increasing in numbers; and if novels are to be written by the hundred (a question which appears to be settled for us by *force majeure*) we see no reason why it should not continue to increase. But one thing has always struck us in these military novels, and that is the exceeding folly of their heroes as generally depicted. We are bound to say that the British warrior does not appear to us to be, as a rule, half so foolish as his brother warriors represent him when they take to novel-writing. The hero of this book, Jack Silver, almost passes the bounds of folly in his conduct towards his betrothed, the artist's daughter, Alice. But the said conduct affords scope for some fair situations, very fairly treated, in the extraordinary double shuffle which follows between Alice, a self-willed Di Vernon of an heiress named Janie Harkhollow, Jack Silver, and a bored but not boring baronet, Sir Charles Bulstrover; and Captain Montague has got hold of a very good thing indeed, and has treated it very far from badly, in the shape of the affection of Claude Meadowleigh towards his daughter, and the despair into which that affection passes at her marriage. His minor characters, especially the baronet's mother, and the lawyer Gnaish, terrible by name and terrible by nature, are not so well managed; but then "the gods are not wont to give everything at once to mankind." They have given Captain Montague enough to enable him to write a very pleasant and creditable book.

GEORGE SAINTSBURY.

COOKERY BOOKS.

First Lessons in the Principles of Cooking. By Lady Barker. (London: Macmillan & Co., 1874.)

Little Dinners: how to Serve them with Elegance and Economy. By Mary Hooper. (London: H. S. King & Co., 1874.)

The Royal Pastry and Confectionery Book. By Jules Gouffé. (London: Sampson Low & Co., 1874.)

LADY BARKER inaugurates her appointment as Manager of the National School of Cookery by this little unpretending volume, which is not exactly a cookery book, in the ordinary acceptation of the term, but a treatise on the best modes of preparing food, and on the principles of diet, as derived from a knowledge of the relative nutritive value of the various kinds of food within our reach. As Lady Barker justly observes, instead of crying out about the high price of food and fuel, and looking fondly back on a cheaper past and the good old prices which will never come again, let us accept as it is the present state of things, and manfully face the increased cost of the necessities of life, and feel how much it is the imperative duty of all to avoid waste, and thereby make the materials at our disposal go as far as we can. The question, therefore, to be considered is, what is the best and cheapest food, and the most wholesome way of cooking it, always bearing in mind that it is not the quantity of food received into the human body which nourishes it, but the proportion of such food as can be digested. Bread and beef Lady Barker adduces as samples of food containing every element required to build up the

human frame, and on the reparative power of beef-tea in illness she strongly insists. She alludes to the insufficient diet allowed in schools, and also to that of the British soldier as contrasted with the well-fed German, whose savoury meal made from pea-sausage and bones we all saw, if we did not taste, at the International Exhibition last year: but then the German soldier has the additional advantage of knowing how to cook his own rations.

Lady Barker goes through all the various modes of preparing food, and concludes that improvement in the knowledge of cookery must begin in the upper classes and spread downwards, that mistresses must know before they can teach, and that though "it is not necessary for ladies to bend over the fire and harden their hands with saucepan handles," yet in these times, when economy in food is become so necessary, ladies should know something more than mere accomplishments, and that a practical knowledge of the art of cookery is quite compatible with the utmost refinement and cultivation of mind.

Following up the same idea of economy, but combined with elegance, Mrs. Hooper seeks to give little dinners at small cost. Her intentions are good, and so may be her recipes; but there is a seeming inconsistency in desiring the linen to be of the finest damask, the glass of the purest crystal, one coloured for hock, flowers and dessert tastefully set out, and yet, to economise the meat, suggesting macaroni, potatoes, or some other "farinage" to be served first, taking us back to our nursery days of rice or roley pudding. On the other hand, she recommends *hors-d'œuvres* of mayonnaise, cheese, &c., "to stimulate the jaded appetite," and prepare us for the looked-for meats, among which we see in her list bullock's and sheep's heart, tripe *sauté*, and sheep's head in three different forms—dishes a little out of place with pink glasses and Silesian damask.

The *Royal Book of Pastry* is a sequence to the *Livre de Cuisine*, previously published by M. Gouffé—both magnificently got up, with chromo-lithographs, &c. The pupil of Carême and other great masters in the art of cookery, M. Gouffé gives us in his book the result of a life's experience, there not being a recipe which has not been prepared by himself. The first part consists of directions for making paste, sweet sauces, and other preliminary preparations necessary before executing the large ornamental pieces. It requires, he says, not only a practical acquaintance with the work, but also a perfect taste and thorough knowledge of modelling and drawing to succeed in the practice of high-class pastry: "I have made a drawing for an ornament twenty times over before I have been satisfied that I had correctly reproduced my idea." The reputation of the writer and the beauty of the work are sure to gain it a favourable reception.

F. BURY PALLISER.

WE understand that the Rev. Dr. Richard Morris will succeed Mr. Alexander J. Ellis as President of the Philological Society, and that Mr. Ellis will take Dr. Morris's place as one of the vice-presidents of the society.

CATHOLIC THEOLOGY.

Essays on Religion and Literature. Edited by Archbishop Manning. Third Series. (H. S. King & Co.). It is to be supposed that this volume, like its predecessors, is in the nature of an invitation to educated men to meet their Roman Catholic countrymen on the common ground of culture and discussion. And the average of intelligence and ability shown by the writers, though it might be higher, is quite sufficiently high to justify the invitation, and yet the volume seems, upon the whole, to be a failure; it leaves an impression that all these intelligent and able people are, after all, beating the air, letting off more or less telling argument at adversaries who are out of range. One great difference which prevents a real understanding is perhaps an assumption on the part of the writers that it must be bad to deny what happens to be true, whether it can be proved or no; though of course there are exceptions to the resulting haziness.

The inaugural address of Archbishop Manning is in his familiar exoteric vein of imposing plausibility; the subject is the relation of Church and State, and the main thesis is the present superiority of voluntarism. He makes a fair historical point that before the Reformation the liberties of the Church were supposed to be matter of law, while the encroachments of the Crown were matter of custom. There is a more questionable page on the incapacity of Anglicanism to restrain the Romanising and rationalising tendencies from "reaching their natural points of rest;" each of these tendencies is so paralysed by inward inconsistency that Anglicanism is likely to survive both. Another defect is that the five possible relations between Church and State leave no room for the condition of the Scotch Kirk, as it now is, much less as it might have been had Chalmers won his game of brag against Lord Aberdeen; for even then it would have been a national establishment. Father Christie contributes a sequel to his former paper on the "Philosophy of Christianity," dealing for the most part with the probabilities about revelation. It contains an extremely neat statement of the Roman Catholic theory of the relative authority of the Church and the Bible; and would have considerable weight with a reader anxious to introduce order and substance among the attenuated unconsidered hypotheses which are at present the vehicle of the sense of duty. Father Aylward's paper on "Ancient and Modern Spiritism" is a thoughtful comparison of the abnormal phenomena obtained by the Neoplatonists with those of modern clairvoyance. The writer insists with great force on the immorality of the surrender of the will to an external power which he holds to be diabolical, the Church apparently being committed to a rejection of Porphyry's view, that such phenomena are due to exalted action of purely human powers. He does not deal with the question whether a matter deserves attention about which scientific verification is unattainable. Dr. Laing makes a really vigorous attempt to treat Darwinism as it is fashionable to treat spiritualism. The first of his papers is headed "A Reassuring Thought at the Ape's Encroachment on our own Likeness." The "reassuring thought" is, that as secant $89^{\circ}59'59''$ is a finite line, and secant 90° an infinite, so it is possible that an absolutely erect animal, man, may have an immortal soul, while animals which approximate indefinitely to erectness are mortal, which seems to be ingenious rather than reassuring. The second paper, "Darwinism brought to Book," is much better; whether under existing circumstances such an attack will be regarded as telling or becoming is hard to say. Circumstances apart, the attack is of the same kind as attacks which have told. The writer certainly makes out that the knowledge available to support a view practically held by almost all competent judges, is so incomplete as to make a very poor figure when drawn out in strict logical form; but, after all, such an observation would be more relevant as a

confirmation of the doctrine of the Grammar of Assent than as an objection to the hypothesis of evolution. It is more to the point that the "tendency" which Mr. Darwin continually postulates is less like an ultimate idea than what we recognise under the old name of "The Spirit of God." The Rev. John Doherty points out, in a rather rambling paper on "Flaws in the Philosophy of Bacon," that he contributed very little to influence the direction in which physical science advanced in England or in Europe, and that he probably helped to give a twist to English speculation on mental science. It is probable that writers who insist upon what Bacon did not do, would produce more effect if they would investigate historically the traces of his real influence. It is rather hopeless to convince the world that such a great reputation is as good as spurious. Mr. St. George Mivart, in his paper on "One point in the Controversy with Agnostics," may be thought to have proved that the proposition that "a series of states of consciousness exists," is not an ultimate truth, but involves a number of postulates which he draws out for the comfort of Conservative Gnostics. Such victories, however, are always barren unless the postulates laboriously reasserted can be made the starting point of deductions pointing to new and fruitful observations in the sphere of experience. The same kind of objection applies to Father Humphrey's two papers on Scholastic Philosophy. In the first, he enumerates the scholastic ideas which are assumed in Roman Catholic theology, and possess, therefore, for Roman Catholics "a more than metaphysical certainty." In the second, he shows that Boethius' definition of a person "*Individua substantia rationalis naturae*" will, if *individua* be rightly taken, fit the Catholic doctrine of the Trinity and the Incarnation; and that Gunther's definition, "a substance conscious of itself," will not, and is filled with enthusiasm at this result. It is exceedingly probable that the real and imaginary knowledge of the contemporaries of Albert the Great and St. Thomas Aquinas was better organised, and came nearer to making a coherent whole than the real and imaginary knowledge of the contemporaries of Mill and Darwin; but it does not follow that mediaeval ideas will be found useful in organising modern knowledge, for mediaeval ideas were abstractions from an experience more limited and more homogeneous than ours. The present instalment of Mr. Lucas' treatise on "Christianity in Relation to Civil Society," is devoted to the proof of two points: "first, that the dogmatic functions of the [Christian] Society must be as absolute in modern as in ancient times; second, that the authority of the Society must be as supreme in matters of fact and discipline as of doctrine." Formally, both points may be said to be proved by the kind of argument that the instructed reader will anticipate; a chapter on the question whether the well-being of the world has always depended, and will always depend to the same extent upon "the Society," would have a more general, perhaps a more substantial, interest. It is the strength or weakness of Mr. Lucas' mind that he naturally argues as if his view was in possession. This gives an air of unreality to his essay on Mr. Mill on the liberty of the Press. If we were living under a censorship, it might be worth while to formulate a definition of liberty, from which it should plausibly follow that it is no more restraint upon liberty to have to acknowledge the truths of Christianity than to have to acknowledge the truths of geometry; as it is, the argument hardly seems worth dissecting. It would have been more instructive if Mr. Lucas had compared Mr. Mill's ideal with the actual condition of the Press, and discussed seriously whether, in its actual condition, the Press does more harm than good, and whether the remedy for the harm it does is to make the Press better or weaker, and how either remedy is to be applied. Though it is hard for a writer on the unpopular side to get a quiet hearing upon a concrete issue, it is hardly worth while to take

refuge, like Mr. Lucas and most of his colleagues, in a line of argument which almost always produces notional, not real, assent. Monsignor Patterson's paper on the religious condition of Germany is rather empty and inadequate. He gives a few statistics and historical remarks, in order that he may denounce the Falk laws, which are bad enough, with an air of authority. He traces those laws to the necessity of conciliating the anti-Christian liberalism of Germany; a simpler explanation which does not exclude the other) would be that success has made Prince Bismarck very overbearing.

G. A. SIMCOX.

NOTES AND NEWS.

THE May number of the *Atlantic Monthly* contains a poem, eleven pages in length, on the late Professor Agassiz, by Professor James Russell Lowell.

MR. S. BARING-GOULD has in preparation a work on the Apocryphal Gospels, and the fragments of other than the Canonical Gospels, which are to be found quoted by known writers, to be published under the title of *Lost and Hidden Gospels*.

A MISCELLANY containing contributions from writers of all parties, including the principal Russian poets and novelists, and scholars of the most opposite views, has just appeared at St. Petersburg. It is entitled *La Cotisation*, and the profits are to be devoted to the relief of the starving population of Samara. The writers, printers, and publishers have all given their labour gratuitously; and it is expected that the sale of the work will reach 10,000 copies at three roubles a copy.

MESSRS. CHARPENTIER are about to publish a work, of which an English translation will appear simultaneously in London, from the pen of M. Odysse-Barot. It is to be called *A History of Contemporary Literature in England*; but the author by no means confines himself to the limits indicated by his title.

MR. HALLIWELL has just issued to public libraries and private friends fifty copies of the six documents from the Lord Chamberlain's office, relating to the actors' shares in the Globe and Blackfriars Theatres in 1635, of which we printed the most important one, from the MS. in the Public Record Office, in the *ACADEMY* of February 21. We regret to see from the short note prefixed to the papers that the publication of the first part of Mr. Halliwell's *Illustrations of the Life of Shakspeare* will be delayed for some months.

WE hear that the next play of Shakspeare to be issued in the Clarendon Press School Series will be *The Tempest*.

WE understand that Professor Bell's long promised edition of White's *Selborne* will contain a memoir of the author, and many hitherto unpublished letters scarcely less interesting than those which constitute the original work. It will be published by Mr. Van Voorst.

DR. C. M. INGLEBY has just finished the second edition of his little book, *The Still Lion*, against rash emenders of Shakspeare's text. The first edition was written for a German publisher, and published in Germany. The second edition will be seven or eight sheets, nearly twice the size of the first. Chapter iii. is on the danger of tampering with the text of Shakspeare, and in particular on misunderstood or misprinted words. Chapter v. is a particular examination and defence of certain passages which have long suffered the wrongs of emendation. The book will be conservative to the backbone.

DR. INGLEBY has also just sent to press his Preface to Part I. of the *Shakspeare Allusion Book* that he is editing for the New Shakspeare Society.

MR. FURNIVALL asks us to mention that the old play of *Edward III.*, of which Shakspeare wrote the episode of the King and the Countess of Salis-

bury, commented on in last week's *ACADEMY* by Mr. Fleay, was reprinted in the Tauchnitz series some years ago, with four other plays attributed to Shakspeare; and all five can now be had of any foreign bookseller for eighteenpence. Also, Chetle's *Hoffman*, which Professor Delius has lately shown was written to match Shakspeare's *Hamlet*, which it follows point by point, was reprinted by Lacy (the late theatrical bookseller) in 1853, and is now sold for two shillings by Russell Smith.

MR. HALES has finished his edition of Milton's *Areopagitica* for the Clarendon press.

WE are glad to hear that the unprinted part of *Pepys's Diary* is being deciphered anew by Mr. Mynors Bright, and that it contains several very interesting passages relating to the theatres of the old gossip's time. We believe that all this fresh matter will be included in the new edition of *Pepys's Diary* now contemplated by a west-end house.

MR. HENRY SWEET's *History of English Sounds*, the last portion of which he read before the Philological Society yesterday, and in which he has very much simplified the representation of the sounds, will probably be issued as a separate book, as well as in the Society's Transactions. The phonetics of our best grammars are always their weakest point, and a short historical treatise on the subject is much wanted.

MR. HENRY B. WHEATLEY will probably issue this season a second part of additions to his *Dictionary of Reduplicated Words* for the Philological Society.

THE Chaucer Society hope to print this season Mr. Henry Ward's essay on the sources of Chaucer's "Knight's Tale," and the poet's debt to Boccaccio in it. Now that Shakspeare's treatment of the story, in *The Two Noble Kinsmen*, is made certain, Mr. Ward's essay is wanted more than ever.

PROFESSOR SEELEY's Political Conversation Class at Cambridge has been very well attended this term. The Historical Tripos is slowly but surely making way in the University.

THE publication of a Danish translation of *Leaves of Grass* gives *Nær og Fjern* the opportunity of commenting at some length on the qualities of Walt Whitman, this "athletic phenomenon of democratic America." The review is, on the whole, warmly sympathetic, both from a literary and a social point of view. It makes a novel attack, however, upon the poet's dream of a life reduced to its simplest functional development, when it points out that such a society of brothers, all athletic and all equally semi-educated, would soon grow to be monotonous and frightfully tiresome. It is perhaps not generally known that Walt Whitman's poetry has long been admired in Denmark.

ACCORDING to *Morgenbladet*, the poet Björnson has bought the estate of Aulstad, near Lake Mjøsen, for 32,000 Spd. (about 7,500*l.*). While it is being prepared for him, he resides in Rome, and is busily engaged in writing, whether prose or verse is not yet stated.

THE new *Quarterly* contains a very skilful and authoritative article on the late Bishop of Winchester, which curiously resembles a vindication rather than a panegyric. The article opens with a partial list of his contributions to the *Review*, from which we learn that he was the author of a very clever plea for the relaxation of clerical subscription in 1865, and reviewed the Queen's books and the Life of Keble, and that his first article in 1849, and his last, three months before his death, were on Mr. Knox's *Ornithological Rambles in Sussex*, and *Autumn on the Spey*. Between 1849 and 1860 he was too occupied with his diocese to write.

Much stress is laid upon the originality of his episcopal ideal, and upon the sacrifices which he made to fulfil it. Perhaps his tendency to impose his own will and his own mind on his clergy has

not been so clearly brought out before. Satisfactory explanations are given of his conduct in the matters of Hampden and the Canada Clergy Reserves, while his persistence in pushing the revival of Convocation in the face of the hostility of the Court is fairly insisted on as a proof that his avowed disinclination to fight what he looked upon as hopeless battles was not due to anything like self-seeking.

Yet where an impression exists that single-mindedness was hardly the most characteristic grace of that earnest and accomplished prelate, it will hardly be removed by a eulogist who admits that he plumed himself on his political foresight, and boasts of the influence of his counsels on political combinations. In fact, Bishop Wilberforce was more remarkable for tenacity of purpose than for tenacity of principle. He understood times and seasons too well to be able to conceive of truth and duty as something eternal and separable from all temporal and local conditions. In action he was entirely devoted to duty in the concrete, but it was impossible that the adroit complacency with which he was able to look at things alternately as a bishop and as a man of the world, as a high Anglican and as a sound Protestant, should be regarded with enthusiasm by lookers-on. A man with transcendental aims is expected to look down upon the expediences and practicalities which the bishop enjoyed and appreciated so highly. If he manages to override them he is admired, and if he has not force for this he had better allow for them in practice without dwelling on them, as a busy man sees things in a street well enough not to knock against them, though he never notices them.

In the current number of the *Revue des Deux Mondes*, M. Emile de Laveleye gives an interesting account of the progress of instruction in Russia. Very important is it to Europe, he remarks, that the Russian people should be instructed, for the empire to which they belong is growing so fast, and developing its resources so rapidly, that it bids fair to become the dominant power of the world, and terrible would be the result for civilisation if that power were swayed by a warlike and ambitious despot, wielding at his will an army of three or four millions, and restrained by no cultured class possessed of numerical importance. It was Peter the Great who first introduced education into Russia, but his efforts were utterly fruitless. Catherine II. ordered schools to be founded in the towns and villages, but her orders were never carried out. After the emancipation of the serfs, an attempt was made to bestow on the liberated peasants the benefits of education, and all sorts of plans and regulations were drawn up, but little beyond a success on paper has been obtained. One great difficulty in Russia is to obtain schoolmasters. Old soldiers are excellent persons in their way, but their stock of knowledge is apt to be limited. To ecclesiastics, also, who have got into trouble and taken to teaching as a last resource, objections may sometimes be made. Another difficulty is the sparseness of the population in most districts, though this might be met, M. de Laveleye suggests, by organising a service of "flying schools," on the plan of those which have worked so admirably in Norway. The report published in 1871 by the Minister of Public Instruction is not encouraging. Out of 34 provinces, only 14 have sent in returns as to the progress of popular education. In those 14, which are the most civilised as well as the most densely peopled in European Russia, comprising 20,425,294 inhabitants, there existed in January 1870 about 4,247 schools, with 4,982 teachers, of whom 3,516 were priests. The number of pupils was 143,385, so that there is only one scholar to every 142 inhabitants, whereas in Denmark, Sweden, Norway, Saxony, and in the Protestant cantons of Switzerland, there is one pupil to every six inhabitants. Clearly it is time that educational Russia should bestir itself.

THE Norwegian primate, Dr. J. L. Arup, Bishop of Christiania, died on April 11, in his eighty-first year. In his earliest youth he served in the French navy, under Napoleon I., and afterwards lived for some time as a tutor in Denmark. In 1836, and twice afterwards, he represented Drammen in the Storting, and distinguished himself there by his brilliant and enlightened defence of religious liberty, until then denied to Norwegians. In 1846 Arup was elevated to the See of Christiania. His religious writings, though few and small, display much literary ability, and before he became bishop he distinguished himself by some translations of Victor Hugo. This extremely modern-minded bishop was one of the many well-known men who have dared to marry their deceased wife's sister.

THE literary novelty of the hour in Scandinavia is Professor L. Dietrichson's historical drama, *Karl Folkunge*, written in Swedish, which has just been put on the boards, almost simultaneously, at Stockholm and at Christiania. Dietrichson, a Norwegian by birth, began his literary life by producing works in Norse, but has gradually learned to write in the tongue of his adopted country. His new drama is well spoken of.

A WELL-ATTESTED centenarian's death is just reported from Sweden. A soldier of the name of Bok, born on February 21, 1774, died in an almshouse at Lund a few days ago. Less circumstantial, but apparently worthy of credence, is the account of another Swedish veteran just dead at Wexjö, aged 101 years and seven months.

EDVARD GRIEG has suddenly waked up to find himself famous. As we mentioned last week, he was born in 1843, at Bergen, in Norway. When he was quite a child, his extraordinary talents attracted the attention of the celebrated violinist, Ole Bull, and in 1858 he was sent to the Conservatory at Leipzig to study music. In 1863 he went to Copenhagen to work under Gade, and soon became the most brilliant of the knot of clever young composers collected there. *Musikalisches Wochenblatt* calls Grieg "the Scandinavian Chopin."

THE Danish composer Hartmann has just brought out a charming little opera at the Royal Theatre of Copenhagen. It is called *Thrymskviden*, and deals with an Icelandic subject.

THE *Moniteur Universel* gives a curious story of the discovery of a princess of the House of Bourbon, resident in the native state of Bhopal, in the heart of British India. M. Rousselet, a French traveller, happened to be present at a grand durbar, held by Sir John Lawrence at Agra in 1866, and was astonished at hearing the name of Madame Elisabeth de Bourbon announced as one of the retinue of the Begum of Bhopal. Shortly afterwards he happened to be in the town of Bhopal, and received a visit from a French ecclesiastic, who proved to be the father confessor of the French princess. On her invitation, M. Rousselet repaired to the palace, where he was received by armed retainers, and conducted to the presence of the princess, or Dulan Sirdar, as she was called. The story of her origin was quite romantic. It seems that in the reign of the emperor Akbar (1557), a European, named Jean de Bourbon, of noble birth, arrived at Delhi. He had been taken captive by Turkish pirates while travelling with his tutor, and by them taken to Egypt. Here he entered the army, and was again taken prisoner in a conflict with Abyssinians. His being a Christian here stood him in good stead, and he was enabled to procure passage to India in a vessel plying between Abyssinia and the Northern Konkan. Landing at Broach, he was attracted to Delhi by the fame of the Great Mogul's splendour, and by his general intelligence gained the favour of that monarch and entered his army. Jean de Bourbon eventually died at Agra, full of honours, leaving two sons. The Bourbons retained their position till the invasion of

Nadir Shah, when Salvador Bourbon went to reside on his estate at Narwar, where he lived in great ease. In 1794, his successor, Bhoba Bourbon, by a curious coincidence, was ousted by a French adventurer in the service of Scindia, just about the time that the more illustrious branch of the royal family in France lost their throne. Bhoba Bourbon was shortly afterwards assassinated, and his son, Enayet Messiah, took refuge with the Prince of Bhopal, from whom he received some estates in reward of his services. In 1816 Balthasar de Bourbon, surnamed Shahzadah Messiah, or the Christian Prince, became the prime minister, and subsequently the regent, of the state, and it is chiefly to his energy that this principality owes its stability and prosperity. Sir John Malcolm, in his *Central India* (i. 420), bears witness to the ability of this minister, and enlarges on the remarkable history of the family. Balthasar died in 1830, leaving his privileges and rights to his widow, Elizabeth de Bourbon, surnamed Doulan Sircar, and his nephew, Bonaventure Bourbon, or Merban Messiah. This presents a curious parallel to the case of Charles X., who died in 1830, leaving a grandson, Henri Dieudonné, the hope of France.

The descendants of Jean de Bourbon at the present day form a clan about four hundred strong, three hundred of whom are located in Bhopal, and call themselves "Francis," a corrupted form of "Français." They are all Christians, and have a church for the use of their community. M. Rousselet was further informed that among the heirlooms of the family is preserved a scutcheon with fleurs-de-lys emblazoned on it, which was originally the property of Jean de Bourbon.

M. Rousselet was present at a solemn fête held on the day of Saint Louis, when prayers were offered up for the welfare of France, the cradle of this little people. The worshippers were clad after the Mohammedan fashion, but some who wore caps removed them on entering the building. A feast was then given in a spacious hall of the palace, and the health of Bonaventure Bourbon was solemnly drunk. The day's rejoicings finished with a display of fireworks.

M. Rousselet soon afterwards left Bhopal, but his curiosity respecting the origin of Jean de Bourbon, the founder of the race, led him to examine contemporary history, and he has since arrived at the conclusion that this Jean de Bourbon must have been an illegitimate son of the Constable Bourbon, born two years before the death of his father at the siege of Rome in 1527, but deterred by the notoriety of his father's crimes from returning to a land for which he had such undoubted affection.

WE have already mentioned the collection of books relating to Paris, at the Hôtel Carnavalet, which is now in process of formation. M. Jules Cousin, its librarian, had intended to bequeath his Parisian library to the city; but the destruction of the library at the Hôtel de Ville during the Commune induced him to perform this generous action during his lifetime. His gift to the municipality consisted of 6,000 volumes and 7,000 prints, which have been increased to 25,000 volumes and 12,000 prints by private generosity, and purchases out of an annual sum voted by the Municipal Council. Besides books on Paris, the library contains only dictionaries, histories, &c., so that it might be strictly termed a Library of the History of Paris. The catalogue is already finished, and is remarkably clear and complete.

M. DESJARDINS has read a Memoir before the Academy of Inscriptions on eleven hundred leaden sling-bullets from Ascoli (Asculum in Picenum). They are a little larger than musket-balls, and many scholars have remarked on the inscriptions found on such bullets; but it has not hitherto been noticed that the balls are palimpsests, and bear three or four inscriptions. M. Desjardins explains this by the scarcity of lead. The bullets, like arrows and javelins, thrown from one camp to the other, were picked up, stamped with a new

mark, and discharged at their former possessors. The same balls sometimes served for years, and those examined by M. Desjardins bear inscriptions which show that they were used at the siege of Asculum in the Social War, the Servile War under Spartacus, and the Civil War of the year 40 B.C.

M. CH. GIRAUD read a paper on Saturday week, before the Academy of Moral and Political Sciences, on two bronze tablets found near Osuna, in Andalusia, containing passages from the municipal statute-law of a Latin colony in Baetica, founded by Julius Caesar. Its date is A.U.C. 710, and the Latinity is excellent, proceeding evidently from the Roman Chancery. These bronzes were discovered about the end of 1870, and kept jealously concealed by their possessor, until their private publication last year by Don Manuel Rodriguez de Berlanga, the same scholar who published the Tables of Malaga twenty years since. They have just been rendered accessible to the learned world at large in the *Ephemeris Epigraphica*, and a full translation will appear in the *Journal des Savants*. These tables are another testimony of the policy pursued by the government of playing off the *municipia* against the Roman aristocracy.

PRINCE EUGÈNE DE CHIMAY'S *Gaspard de Coligny, d'après ses Contemporains* is a pleasant if not particularly profound incursion into the historical by-ways of the sixteenth century. Prince de Chimay describes the Renaissance period, and its central martial figure, Gaspard de Coligny, with a good deal of picturesque vigour. The reader follows Coligny's life step by step, through the wars of the reign of Francis I.; beholds him administering Picardy and Artois under Henry II., concluding peace with Spain at Vauxcelles, and doing his best to deliver France at St. Quentin from the iron grip of Philip II. This first portion of the volume is by far the most graphic. It has something of the bold colour and vivacity of Brantôme's egotistic chronicles. The author is too fervent a papist to describe the second portion of Coligny's life with historical impartiality. He moralises unnecessarily over the transformation of the old Admiral into a party chief and a militant Huguenot; and considers that bloody episode of the Saint Bartholomew, his assassination, something of a divine judgment.

THE Catalogue of the MSS. of the Municipal Library of Bordeaux, which is now in the press, contains several items of interest. Among these are a copy of the translation of Livy by the Benedictine Pierre Berchoire or Bersuire, with carefully executed miniatures; a Romance translation of the *Aphorisms* of Hippocrates, with glosses; a version of the *Peregrino* of Jacques Covuzo, which was very popular in France at the beginning of the sixteenth century. The Municipal Council are also publishing a series of works relating to the history of the city; two volumes have already appeared, *Le Registre des Bouillons* and *Délibérations de la Jurade de 1405 à 1411*. A third volume, by M. Léo Drouin, which will appear shortly, relates to the topography of the town in the fourteenth century; every street is marked and described according to contemporary documents, and a large plan is appended.

M. MAXIME DU CAMP's study on "Les Cimetières de Paris," in the current number of the *Revue des Deux Mondes*, is a perfect storehouse of arguments for the advocates of cremation. Incidentally, too, the article offers many points of interest. The author dwells on the strange contradiction between that sceptical population of Paris, without reverence and without a creed, and its almost idolatrous veneration for the relics of its dead. We can forgive him for moralising as he takes us through the cemeteries where the slayers and their victims lie side by side, the holders of power who have followed one another with such bewildering rapidity to the scaffold and the tomb, and where the flowers planted by pious

hands are blooming on the graves of the men of the Commune, as on the turf that covers the remains of the victims of the Terror and the Restoration. During the last century, the great burial place of Paris was that of the Holy Innocents. So long ago as 1554, the condition of this ground was suspected as imperilling the health of the city. In that year two learned physicians were ordered to study the question and report upon it. They recommended its immediate suppression, but were not listened to. Again in 1737 the Academy of Sciences appointed a commission, who reported to the same effect, and with the same result. In 1765 a decree was issued, forbidding interments in the existing cemeteries and in the churches, and ordering the selection of seven or eight spots for cemeteries outside Paris; in 1786 this decree was at last carried out.

Here is a characteristic description of this cemetery during the seventeenth century:—

"The people of Paris loved their cemetery, where they were treated to the sight of grand processions with incense and psalmody on the bells on certain holy days. They came thither gladly to offer up their prayers at the popular church of the Holy Innocents, to admire the monuments, the chapels, the alabaster skeleton wrongly attributed to Germain Pilon, the old pulpit where he preached so grandly during the League, the Glatine cross, the statue of Christ, which was called the God of the city, and the tower of Notre Dame des Bois, where every evening a lamp was lighted which served as a beacon to this field of the dead. Buying and selling went on; dealers in finery and linen sold their wares in the galleries; against the pillars of the arcades, beneath the charnel-houses that bent beneath the weight of bones, the public writers had installed their tables, and supplied epistolary literature at a fixed fee. The Messieurs de Villiers, who visited the charnel-houses in January 1657, say: 'If it is in the grand style, the letter is worth ten, twelve, or twenty *sols*; if in the humble style, it is only five or six *sols*.' The crowd was always circulating; it was a regular promenade. . . . All the Parisians were persuaded that the earth of the cemetery of the Innocents had the property of devouring corpses in twenty-four hours."

NOTES OF TRAVEL.

THE group of islands known as the Nicobars, situated about 150 miles south of the Andamans, has been but little explored, though the manners and customs of the inhabitants of these islands offer very interesting peculiarities to the notice of the ethnologist. One of the most noticeable of these, and one which seriously affects the trade of the islands, is the passion for old hats which, without exception, pervades the whole framework of society. No one is exempt from it. Young and old, chief and subject alike endeavour to outvie each other in the singularity of shape no less than in the number of the old hats they can acquire during their lifetime. On a fine morning at the Nicobars it is no unusual thing to see the surface of the ocean in the vicinity of the islands dotted over with canoes, in each of which the noble savage, with nothing whatever on but the conventional slip of cloth, and a tall white hat with a black band, may be watched standing up and catching fish for his daily meal. Second-hand hats are most in request, new hats being looked upon with suspicion and disfavour. This curious passion is so well-known that traders from Calcutta make annual excursions to the Nicobars with cargoes of old hats, which they barter for cocoa-nuts, the only product of these islands: a good tall white hat, with a black band fetching from fifty-five to sixty-five good cocoa-nuts. Intense excitement pervades the island while the trade is going on, and fancy prices are often asked and obtained. When the hats or the cocoa-nuts have at length come to an end, the trader generally lands a cask or two of rum, and the whole population in their hats get drunk without intermission until the rum also comes to an end. It is curious that in those far-away regions so profitable a market should be found for

cast-off specimens of one of the most disagreeable symbols of civilisation.

The same yearning after better things in a more advanced stage may be observed in Madagascar, where no official is content if he cannot deck himself out in the tarnished plumage of some long defunct admiral, general or ambassador.

AUSTRALIAN newspapers report the success of Major Warburton's exploring expedition. The party had arrived at a place 150 miles from the De Grey river, out of provisions, having eaten all but three camels, but they had made their way over some 900 miles of unknown country and discovered a route from Southern to Western Australia. News had also been received from the expedition sent out in search of Sinclair and his comrades, who, it was feared, had been lost on the coast of Northern Australia. The relief party arrived just in time to rescue the explorers, who had experienced a series of disasters. They had been cast ashore, with loss of boat, at Vasilicon Head, Port Essington, and had then attempted to coast round to Port Darwin in canoes, but were again cast ashore at Cape Don, the extreme end of Coburg Peninsula, with loss of rations, clothing and canoe. They then endeavoured to make their way through swamp and bush and were found by the natives, despatched to their aid, in the last stage of exhaustion. Sinclair, the leader, had suffered very much from having had to walk forty miles through the bush without boots or body clothing, and for three days the whole party had been without food. The natives had been most friendly, and without their aid the explorers must have perished. The relief party visited the old settlement, Victoria, and found parts of the fence and jetty, erected thirty-five years ago, in perfectly sound condition. They saw a small herd of splendid cattle and tracks of horses and buffaloes. The harbour is reported as good, but inferior to Port Darwin. "Formation: ferruginous sandstone; no trace of any other mineral. Soil, as a rule, poor and hungry, but rich on inundated flats. Country well grassed and heavily timbered throughout."

THE annual Report of the Melbourne Zoological and Acclimatisation Society has just reached us, and contains some items of interest. The flock of Angora goats had been largely increased, and no doubt existed as to the suitability of the climate to this valuable animal. The Society's ostriches had been removed to Swan Hill, where they were expected to thrive better than in their old quarters on the Wimmera. Deer, hares, Californian quail, French pheasants, and English skylarks had been liberated during the year, besides large numbers of carp and trout. Trout-ponds, for breeding purposes, had been constructed at Wooling, Mount Macedon, and their probable success may be inferred from the fact that many large trout have been captured in the various creeks that have been stocked by the Society—in one instance a fish having been caught weighing more than 9 lb. Sir Henry Barkly had presented to the Society a pair of elands from the Cape Colony, and a hope was expressed that a herd of these animals might be raised as, we believe, has already been the case in England.

WE understand that another most important step has been taken towards that amelioration of the state of affairs on the East Coast of Africa, of which so much has lately been said. The completion of a contract between the French Government and the British India Steam Navigation Company for the despatch of a monthly mail steamer from Zanzibar to Nossi Bè, Mayotte and Madagascar was announced in our columns in February last, and we are now informed that a further contract will shortly be concluded between the same company and the Portuguese Government, which has for its object the extension to the whole of the Portuguese possessions on the East Coast of Africa of a monthly line of steam communications to and from Zanzibar. The impetus

thus given to trade must be enormous, and these new steam lines will also render a sporting trip to Africa a much less expensive, less uncertain, and more speedy undertaking. It is unnecessary to point out how valuable an aid will also be furnished by these steamers towards the suppression of the slave trade, which still shows extraordinary vitality.

The *Débats* of April 24 draws attention to the endeavours that are now being made to explore the West Coast of Africa, more particularly in the regions watered by the Congo and the Ogoway rivers. The exploration of the Congo now rests upon the shoulders of one of our own officers, Lieutenant Grandy, R.N. The Ogoway has been more lately brought to notice by the Admiral du Quillo, who ascended the river to a distance of about 160 miles from its mouth. He found the French flag everywhere well received, and states indeed that it is the standard always used by the chiefs on their various expeditions. M. du Quillo's presence was taken advantage of for the settlement of many intertribal disputes. The population of these countries is described as consisting of Orongous, who inhabit the coast from Sangatoug as far as the island Lopez, and the right bank of the Ogoway as far as the point Dembo. The Camas, who inhabit the borders of Mexias and of Fernand-Vaz or Rembo, outnumber the Orongous; the Gallois (10,000) are more numerous than either, and have the country in the proximity of the Lake Onangué, and on the right bank of the river as far as N'Gouniè. There are also some tribes of Bakalais, d'Ivilis, Inengas, and of Pahouins who, having emigrated from the interior, are daily approaching nearer and nearer to the sea. The language almost universally used is the Pongoué, from which fact the *Débats* considers it probable that all these tribes were formerly part of the group which also included the Gabonnais.

There is a fairly prosperous commerce in ivory and caoutchouc, which is principally in the hands of the Bakalis; and it is represented that the sale of slaves brought from the interior by the Inengas to Portuguese traders has but lately ceased. The Portuguese language is still the best known by the natives. The flora and fauna of the Ogoway are of the same nature as those of the Gabon; and among the birds a great variety of beautiful parrots is especially remarked. There are two European traders in these regions, one English and the other German.

The Admiral du Quillo did not reach the lake Onangué, but he verified the impossibility, either by canals or by the Igongonoué, of getting back to Fernand-Vaz. The delta of the Ogoway has throughout a southerly direction in all its ramifications. The bed of the river is described as being generally impeded by shifting sandbanks, which render navigation exceedingly difficult in any other craft than the native canoe. MM. Marche and De Compiègne are now engaged in further exploration of this interesting region.

RECENT geological explorations in the Western United States, towards which Congress has just voted a sum of 10,000 dols. for the current year, have led to some discoveries of great interest. It appears that between the Mississippi and the Rocky Mountains a series of great lakes formerly existed, in the midst of a fauna and flora of the most luxurious tropical character. An examination of the lower strata, which crop out here and there, has revealed extensive remains of hippopotami and titanotheria, an extinct pachyderm much larger than our elephant. Fossil turtles of all sizes, and certain primeval types of our modern stag and boar, are here found in vast numbers. Hard by, the relics of tigers, hyaenas, wolves, camels, and numerous other beasts have been brought to light; while various species of rhinoceroses, mastodons, elephants, and other pachyderms used apparently to congregate here in herds. All these discoveries tend to prove that America has a better claim to the title of

"Old" than that of "New World," so generally bestowed on her.

As might have been anticipated, the expedition which started under Lieutenant Grandy, R.N., from the West Coast of Africa, has not found it all plain sailing. Lieutenant Grandy's brother, who has returned to this country, reports that so many difficulties had been met with on the southern bank of the river, that it had been found necessary to cross the river to the northern bank, a measure which it may be presumed will seriously disarrange the original plans of the expedition. The nature of the difficulties met with is not clearly stated, but they were connected principally with the disinclination of the natives to allow the passage of white men into the interior.

It would appear, from a telegram in the *Times*, which we quote below, that the Geographical Society in St. Petersburg has after all carried its point in the equipment of a large expedition, headed by the Grand Duke Nicholas Konstantinovich. We had been informed that the Government had disapproved of the scheme of the Geographical Society, and had granted a sum of 10,000 roubles to the Society of Naturalists of Moscow, for the despatch of a scientific party, composed of Mr. Alenitzin (to the Aral), Mr. Grimm (to the Caspian), Mr. Barbot de Morny (geologist), and Messrs. Bogdanof and Butlerof (zoologists) to Mangryshlak, and thence to the Aral and across that sea to the delta of the Oxus. According to this project the ancient bed of the Oxus was not to be made the subject of investigation.

There have evidently been some differences over the question of these expeditions, and it is said that the retirement of Baron Osten Sacken and Colonel Veniukof from their functions at the Geographical Society is referable to some divergence of views.

The paragraph to which we refer is as follows:—

"At the meeting of the Geographical Society on Wednesday evening the secretary announced that the expedition was finally organised. It will be commanded by the Grand Duke Nicholas Constantinovitch, assisted by Colonel Stoletoff and Dr. Moreff, as secretary. It will include twenty-five persons, whose work will be divided into four sections:—1. The trigonometrical and topographical, consisting of six topographers and one hydrographer, Captain Zubow, who will survey the delta of the Amu Daria and all the places on that river, ascertain the levels between the Amu Daria and Syr Daria, and survey hydrographically the channels of the Amu Daria. 2. The meteorological section will construct two stations on the Amu Daria, at one of which hourly observations will be made of meteorological phenomena. The profile of the Amu Daria will be determined, and the rise and fall of its waters and the velocity of its current noted. The same observations will be repeated at the second and lesser station. This section will consist of nine persons—viz. the chief meteorologist, Dorondo, his assistant, and seven observers. 3. The Ethnographical Statistical Section will collect information on the numbers and classification of the inhabitants, describe their social and economical condition, collect traditions and manuscripts, determine the sites of places mentioned in historical records, and examine ruins. This section will be composed of five members—Colonel Stoletoff, Dr. Moreff, Colonel Skoboleff, the draughtsman Karazin, and the interpreter, Sartlanow. 4. The natural history section will study the geology, botany, and zoology of the Caspian lowlands, ascertaining their flora and fauna. These labours will be undertaken by the naturalist Severtseff, the botanist Smirnow, and the geologist Barbot de Morny. Explorations will also be made beyond the confines of Russian territory in the Khawate of Bokhara up the course of the Amu Daria, if the political aspect of affairs in Central Asia will permit. The commander and most of the members of the expedition will leave St. Petersburg next Sunday, and will rendezvous at Kazalinsk, on the Syr Daria."

The first general meeting of the French Geographical Society was held on the 26th ult. The President spoke of the deaths of Dr. Livingstone

and Francis Garnier, of the coming Congress, and of the loss the new French Alpine Club has sustained in the death of its president, M. de Billy, who was elected on April 2, and killed on April 4 in a railway accident near Dijon. M. Henri Duvoyrier gave a summary of the contributions of Dr. Livingstone to geographical science; and l'Abbé Bouche, formerly missionary at Dahomey, gave an account of an excursion from Lagos to Cotonou on the Gold Coast. The Society then proceeded to award the annual prize for the most important discovery in geography. Reserving for the future the claims of Dr. Schweinfurth, Ney Elias, and Nachtigall, whose labours are still incomplete, the Commission, under the presidency of M. Malte-Brun, awarded the gold medal to M. Alphonse Pinard. M. Pinard has passed a year in exploring the coast of Alaska and the Aleutian Islands, and has brought back valuable collections of objects of natural history, and important geographical and ethnographical information.

CORRESPONDENCE.

IS "ROSE" A SEMITIC OR AN ARYAN WORD?

Oxford: April 25, 1874.

Professor W. Wright, in his letter to the ACADEMY, dated April 15, remarks:—

"Professor Müller will, I hope, excuse my correcting a slight mistake into which he has fallen. *Verd*, 'a rose' in Turkish, is not 'a Persian, i.e. an Aryan word,' but an Arabic, i.e. a Semitic word. There can, however, be little doubt of the identity of the Arabic word, Aramaic *wardā*, Greek *ῥόδον* or *ῥόδω* (i.e. *vrodon*), and modern Persian *gul*."

There are few words, I believe, over which Aryan, Semitic, and even Hamitic scholars have fought so persistently as the name for *Rose*, and if Professor Wright has really satisfied himself that the body of Patroclus belongs to the Semitic army, and not to the Aryan, I hope he will give us his reasons. Till I know them, I hold as strongly as ever that the name *ward* and its derivatives, in whatever language they occur, have an Aryan origin, nor can I see how, if *ward* was originally an Arabic word, and yet identical with Greek *ῥόδον*, as Professor Wright admits, it could have found its way from Arabic, not only into Homer (*ῥοδοδάκτυλος Ἥρα*), but into the language of Greek mythology (*Ῥόδος*, *Ῥόδη*, &c.).

The more one studies the history and etymology of the word *Rose*, the more one perceives how full of thorns it is. Few scholars have touched it without pricking their fingers. I do not promise to solve the problem; I only wish to point out the difficulties which have sometimes been overlooked, and I shall try to show why, on the whole, the evidence seems to me to be decidedly in favour of an Aryan origin of the word.

I begin with the end, the names for *rose* in modern languages. Here, nothing seems at first sight clearer than that the French *rose*, Ital. *rosa*, is the Latin *rōsa*. Yet, it is not. If the modern Romance words had been derived direct from the Latin *rōsa*, with a short o, we should, according to Diez, have had *ruosa* in Italian, and not *rosa*. The Romance words, therefore, presuppose a vulgar Latin *rōsa*, with long o, or they must be treated throughout as purely scientific terms.

But what is *rosa* in Latin? Here we find in our best classical dictionaries one and the same answer: viz., that the Latin *rosa* is connected with the Greek *ῥόδον*; and if we look for *ῥόδον*, we are informed that *ῥόδον* is connected with *red*.

Now, all this is simply impossible. How can *ῥόδον* become *rosa*? If it was a foreign word, adopted from Greek, as most likely it was, how shall we account for the change? If we were to treat it as a common Aryan word, then we should be driven to admit with Corssen (i. p. 812) a very exceptional suffix *sa*, and explain *rosa* as *vrod-sa*, from the root *vardh*, to grow, which never appears in that form (*vrod*) either in Latin or in Greek.

A very extraordinary solution of the difficulty has lately been proposed on two successive occasions by Dr. Fick. In his *Wörterbuch*, and again in his *Spracheinheit* (pp. 359 and 368) he tells us, first, that *rosa* is connected with Sanskrit *rāsa*, dew, Latin *rōs*, *rōris*; secondly, that *ῥόδον*, *ῥόδος*, is connected with *ῥίζα*, *ῥιζα*, for *ῥαίζα*, the Goth. *vaurt-i-s*, root. How *rōsa*, as far as its form is concerned, can be derived from *rōs*, *rōris*, Dr. Fick does not explain; but as to the meaning, he can hardly be serious if he appeals to *ros marinus*, in order to show that *ros*, dew, may become the name of a flower. I prefer to confess my ignorance as to the exact antecedents of the name *rosa* in Latin, for I hardly like to suggest that the Greek word *rhodon* was, through a well-

known tendency of language to acclimatise foreign words, assimilated to *russus* or *rusus*, red, and thus irregularly changed to *rosa*.

But what about the Greek *ῥόδον*? Of course, during the last century, *ῥόδον* was compared with *red*, Goth. *raude*, and its relatives; but that such etymologies should survive to the present day, even in the best Greek dictionaries, is strange. Is poor Grimm never to have any rest in his grave? If *ῥόδον* existed in Gothic, it would change *d* into *t*; and if *ῥόδον* had anything to do with *ῥοῦρος* or *rudhira*, it could not have *d* in Greek.

Then to what root can *ῥόδον* be traced? Possibly, and I say no more, to a root *ṛad*, to be soft, which occurs in the Veda, and which would, phonetically at least, offer a tolerable explanation of the Greek *ῥίζα*, i.e. *βριδία*, as the soft fibres, and of *βρόδον* as the tender shoot. For the same rule, to which I referred just now, which precludes the admission of any real connexion between *ῥοῦρος* and *ῥόδον*, precludes equally the admission of any organic relationship between *βρόδον*, *vaurt-s*, *ῥίζα*, and the root *ṛadh*, to grow, to which these words have sometimes been referred.

And yet I think that *βρόδον* may be derived from the root *ṛadh*, only not directly, but indirectly—not as a native, but as a foreign word in Greek. Though the word belongs to a very ancient stratum of language in Greece, it may have been borrowed quite as much as *κοινὴ*. The garden rose is, I believe, botanically and historically, of Persian origin. It is called *ṛad* in Persian and in the *Pehlvi-Pazend Glossary*, edited by Destur Hoshangji Jamsapji Asa, p. 228, we find *varta* with the same meaning. If, therefore, the rose came to the Greeks from Persia, and if in Persia it was called *ṛad*, we can hardly resist the conclusion that *ṛad* or *ṛad* was adopted in Greek as *βρόδον*, and thus became the classical name for rose.

Then remains the question, why the rose in Persian was called *ṛad*. And here, I think, the best answer has been given by Spiegel, Justi, Pott, and others, who identify *ṛad* with the Zend *vareda*. Justi remarks: "One might, against the tradition, translate *varedhabyas ka* 'from the flowers,' referring *varedha* (fem.) to the modern *gul*, Armen. (Arab.) *ṛad*, Chaldaean *ṛad*." *Vareda* would therefore originally have meant, in the most general way, what grows, what is grown; it would then have become *par excellence* the name of the flower in a certain locality, just as most rivers were first called the river; and then, like *al-nus*, *ul-mus*, *il-ex*, *ar-undo* (see Corssen, i. p. 812), have become specialised as the name of one flower, viz., the rose.

If that is the origin of the word, we can well understand its spreading from Persia to Armenia, to Chaldaea, to Egypt, to Greece, and we can also account for the regular change in Persian from *ṛad* to *gul*. I think it was Dr. Oppert who, in 1851, first showed that old Persian *ṛd* becomes *l* in modern Persian, and that *ṛad* and *gul* are as much the same word as *heart* and *dil*. It is difficult in these matters always to observe the *sum cuique*, but at all events Dr. Oppert's article (*Journal Asiatique*, 1851, p. 260, note) came before Spiegel and Friedrich Müller's articles (Kuhn's *Beiträge*, i. 317; ii. 493), to whom this observation is generally ascribed. Spiegel says that there is no Semitic etymology for the word *ṛad*, and that its initial renders it suspicious. He traces the word back to the Zend *vareda*. F. Müller doubts the Persian etymology, and asks whether it may not be of Coptic origin (*ouert* and *ouert*), "as it has been proved to be a borrowed word in Semitic."

I have thus given the principal reasons why I have always considered *ṛad* as a Persian, i.e., an Aryan word; and as there is no one whose opinion on the Semitic side I should value so much, I hope Professor W. Wright will now give us his reasons for considering *ṛad* an Arabic, i.e., a

Semitic word. The difficulties I feel about a Semitic origin of the word are these:—

1. If the word was originally Arabic, how did it find its way into ancient Greek?

2. If the word was originally Arabic, would it, as a foreign word in Persian, have undergone the change of *v* into *g*, and *rd* into *l*?

3. If the word was originally Arabic, what is its Semitic root?

MAX MÜLLER.

SULTAN OTHMAN.

Twickenham: April 27, 1874.

Mr. Wright will, I hope, excuse my correcting an error into which he has fallen. He has confused the name of the Kalif Othman and the Sultan Othman. The former, who was an Arab, doubtless bore an Arabic name, which, for aught I know, may have meant "the young of a bastard," or "the young of a snake." The Sultan Othman, on the other hand, was a Turk, and he was born at a time when Arabic had not begun materially to influence Turkish speech. His name is a true Turkish name, which the Arab historians, like Mr. Wright, have confused with that of his predecessor. As Gibbon well phrases it, the founder of the Ottoman Empire was "Thaman or Athman, whose Turkish name has been melted into the appellation of the Caliph Othman." Gibbon, as usual, is quite correct. In the ancient records of the Turkish race we repeatedly meet with the name borne by the Great Sultan. Thus the Chinese annals (B.C. 214) mention a Turkic Khan who was called Toman or Teuman; and the Turkish traditions inform us that a Khan called Tumen conquered the Tunguses in the year 546 A.D. This Altaic name may probably be identified with the well-known designation of Hetman (Atman), which is still borne by the chief of the Don Kosaks, a Turkic tribe.

I have not the needful books of reference at hand, but I believe I am not far wrong in saying that the Turkic name or title means "Horse General," a designation for the leader of a horde of Tatar horsemen, far more intrinsically probable than an Arabic word meaning "the young of a bastard," or "the young of a snake."

Even if I had been wrong in this matter, instead of being right, I do not see how the trivial mistake of supposing that a Turkish Sultan may have borne a Turkish name would justify the tone of Mr. Wright's letter, or how an issue so irrelevant would affect the question of the Altaic character of the Etruscan speech, which is the only thesis which I am concerned to defend.

ISAAC TAYLOR.

DATE OF PRIVY COUNCILLORSHIP OF LORD WENTWORTH.

April 21, 1874.

Like most other people, I have, till within the last few days, believed that Wentworth became a privy councillor in the autumn of 1628, and that thus, whatever might be the character of the step taken by him, the change was all over within a few months after the prorogation of the session on which the Petition of Right was passed. An inspection of the Privy Council Register has shown me that this is a complete mistake. Wentworth became a privy councillor only on November 10, 1629. It is needless to say what a revision of opinion this fact necessitates. After the session of 1628, Wentworth merely became a peer with the promise that he should be Lord President of the North, where he would be able to put in force those strict measures against the Roman Catholics which he had supported in the House of Commons. But till he became a privy councillor he had no responsibility for the general government of the kingdom; and this, we now learn, he did not take upon himself till after the final breach between the King and Commons, in 1629. No one who has studied the evidence can doubt

that Wentworth would then be conscientiously of opinion that the King was right and that the Commons were wrong. SAMUEL R. GARDINER.

EXTENSION OF THE APPLICATION OF METRICAL TESTS TO THE GREEK DRAMATISTS.

Skipton Grammar School: April 25, 1874.

I have applied tests exactly similar to those which have proved successful in the cases of Shakspeare, Massinger, and Fletcher, to the works of Aeschylus and Sophocles, with the following results as to the chronological order of composition: in the instance of the later plays of Sophocles this is not necessarily the exact order of production to the public.

Aeschylus.

1. Supplices.
2. Persae.
3. Septem contra Thebas.
4. Agamemnon.
5. Choephoroi.
6. Eumenides.
7. Prometheus.

Sophocles.

1. Antigone.
2. Ajax.
3. Trachiniae.
4. Electra.
5. Oedipus Coloneus.
6. Philoctetes.
7. Oedipus Rex.

The coincidence of this order with that given by the combination of external evidence with the inferences of Hermann and others from style, is too striking to be overlooked. I shall be very thankful for any criticisms public or private on this arrangement before I publish further details; also for information as to any researches on Greek choral metres that may be unknown to me. I am going on with the investigation for Euripides and Aristophanes. I should add that the ratios for Nos. 2, 3, 4 of the Sophocles plays are very close, and may be altered by further investigation: the metrical order of the others and all the Aeschylus series is, I think, certain.

F. G. FLEAY.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

- | | | |
|------------------|---|---|
| SATURDAY, May 2, | 1 p.m. | Sale at Christie's of a portion of the Collection of Pictures of the late W. Twopeny, Esq. |
| " | " | Sale at Christie's of Pictures of the Early English School and Old Masters. |
| " | " | Sale at Christie's of Thirty Modern Pictures. |
| 3 p.m. | Royal Institution: | Professor Seeley on "The French Revolution." |
| " | Crystal Palace: | First Summer Concert. |
| " | New Philharmonic Concert (St. James's Hall). | |
| MONDAY, May 4, | 10 a.m. | Royal Academy Exhibition opens. |
| " | 1 p.m. | Sale at Sotheby's of Professor Church's collection of old English pottery and porcelain. |
| " | " | Sale at Christie's of the remaining portion of the Collection of Pictures and Drawings of the late John Baker, Esq. |
| 2 p.m. | Royal Institution: | General Monthly Meeting. |
| 3 p.m. | Herr Paner's first Historical Concert (Hanover Square). | |
| 7 p.m. | Entomological Society of Arts: | Cantor Lecture. Mr. F. Barff on "Carbon and Compounds of Carbon." (IV.) |
| " | British Architects' Medical. | |
| " | Philharmonic Concert (St. James's Hall). | |
| 8.30 p.m. | Royal United Service Institution: | Captain W. S. Crondeau on "Crondeau's Stellar Azimuth Compass, and Ormance Night-Light Vane or Collimator;" Mr. A. Folkard on "Improvements in Apparatus for Lowering, Hoisting, Engaging, and Freeing Ships' Boats." |
| TUESDAY, May 5, | 3 p.m. | Royal Institution: Professor Rutherford on "The Nervous System." |
| " | 7 p.m. | Sculptors of England. |
| " | 8 p.m. | Anthropological: Dr. Anton Bachmeier on "Pasigraphy;" Mr. A. L. Lewis on "The Oxfordshire and Kentish Groups of Rude Stone Monuments;" Civil Engineers. Pathological. |

- 8.30 p.m. Zoological : Mr. A. H. Garrod on "Some Points in the Anatomy of the Columbae;" Dr. Julius Haast on "The Occurrence of a New Species of *Euphysetes* (*Euphysetes Pottii*), a remarkably small Catodont Whale, on the Coast of New Zealand;" Mr. F. Moore on "A List of Diurnal Lepidoptera collected in Cashmere by Captain R. B. Reid."
- " Biblical Archaeology : Mr. J. W. Bosanquet on "The Synchronous History of Israel and Judah, B.C. 745-638;" Dr. H. Fox Talbot on "A Revised Translation and Further Notes upon the Legend of the Descent of Ishtar into Hades;" Messrs. Bonomi and Sharpe, "An Account of a Granite Altar in the Museum at Turin;" Dr. Birch on "The Translation of the Hieroglyphic Inscription upon the Granite Altar at Turin."
- WEDNESDAY, May 6, 8 p.m. Society of Arts : Mr. F. E. Thicke on "Timber Houses."
- " Obstetrical. Microscopical.
- " New Philharmonic Concert (St. James's Hall).
- THURSDAY, May 7, 3 p.m. Royal Institution : Mr. W. N. Hartley on "The Atmosphere and its Relations to Life."
- 6 p.m. Royal Society Club.
- 8 p.m. Linnean. Chemical.
- 8.30 p.m. Royal. Antiquaries.
- FRIDAY, May 8, 1 p.m. Sale at Christie's of Landseer pictures. 1st day.
- 3 p.m. Hallé's first Recital (St. James's Hall).
- 7 p.m. Literary and Artistic.
- 8 p.m. Royal Institution : Weekly Evening Meeting.
- " Society of Arts : Dr. Griffin on "Sugar Refining, with special reference to Fenzl's Sugar Crystals."
- " New Shakspeare Society : Rev. F. G. Flay on "The Authorship of *Timon of Athens* and *Pericles*."
- " Astronomical. Clinical. Quakett Club.
- 9 p.m. Royal Institution : Mr. Sedley Taylor on "An Historical Enigma in the Trial of Galileo before the Inquisition."

SCIENCE.

Essays : Scientific, Political, and Speculative.
By Herbert Spencer. Vol. III. (London : Williams & Norgate, 1874.)

THIS third volume of the collected *Essays* of Mr. Herbert Spencer consists to a large extent of papers of a somewhat controversial character. Two essays are devoted to the exposition of his classification of the sciences, and the defence of it against the Comtists and Mr. Bain. Another contains a defence of his individualistic theory of the social organisation against the criticisms of Professor Huxley. In a fourth, entitled *Replies to Criticisms*, Mr. Spencer attempts to repel attacks made from various quarters upon the metaphysical basis of his system. This last essay is the most important in the volume, and only a fragment of it has been already published in the *Fortnightly Review*. It shows, like everything written by Mr. Spencer, comprehensive knowledge, great mental fertility and resource; it shows remarkable intellectual honesty and willingness to appreciate and meet fairly the objections of opponents; but it shows also, I think, that he is becoming partly conscious of the weak points of his system. In particular he seems himself to doubt the satisfactoriness of the answers which he gives to two of his critics, Mr. Sidgwick and Mr. Martineau. I shall therefore make a few remarks on the points on which the controversy turns.

The most frequent mistake of philosophers is, that while they attempt to analyse the mind and the process of knowledge, they

fail to account for their own point of view in doing so. They take up a position similar to that of an artist who is putting together a machine, and who examines each part by itself before he unites it with the others to accomplish the purpose in view. They do not sufficiently remember that the mind is an instrument which we have no other instrument to examine but itself, and that in order to analyse knowledge we must know. We are therefore asking a testing question when we inquire whether our author's philosophy can account for itself; in other words, can we account for Mr. Spencer's philosophy consistently with the view of knowledge taken by Mr. Spencer himself?

His *First Principles* begins with a theory of the Unknowable, or of the limits of the human understanding. We can know, he maintains, only the finite, not the infinite; only the relative and phenomenal, not noumena or things in themselves. One of Mr. Spencer's critics (p. 256), asks the natural question, How can we know a limit without in some sense going beyond it? how can we know that we are finite unless we know the infinite with which we compare it? Mr. Spencer (p. 257) states that he had anticipated this objection, but had not thought it necessary to mention it, as it seemed to him sufficiently met by arguments which he sums up as follows:—

"Reason leads both inductively and deductively to the conclusion that the sphere of Reason is limited. Inductively, this conclusion expresses the result of countless futile attempts to transcend this sphere—attempts to understand Matter, Motion, Space, Time, Force, in their ultimate natures—attempts which, bringing us always to alternative impossibilities of thought, warrant the inference that such attempts will continue to fail as they have hitherto failed. Deductively, this conclusion expresses the result of mental analysis, which shows us that the product of thought is in all cases a relation, identified as such, or such; that the process of thought is the identification and classing of relations; that therefore Being in itself, out of relation, is unthinkable, as not admitting of being brought within the form of thought. That is to say, deduction explains that failure of Reason established as an induction from many experiments. And to call in question the ability of Reason to give this verdict against itself, in respect of these transcendent problems, is to call in question its ability to draw valid conclusions from premises; which is to assert a general incompetence necessarily inclusive of the special incompetence" (p. 258).

In this passage Mr. Spencer's deductive argument is, that "the product of thought is in all cases a relation," and therefore "Being in itself out of relation, is unthinkable." But if he admits the validity of the argument, that to know things as limited we must be able to go beyond the limit and apprehend the Infinite, he must for the same reason admit that we cannot know things as relative without going beyond Relativity and apprehending the Absolute. He does not escape the argument by changing the category in which it is drawn. If the Absolute, the thing in itself is unknowable, how can we know that it exists, and so be able to contrast the knowledge of it which we have not with the knowledge of the phenomenal which we have. If all things are relative, to know them as relative is absolute knowledge of them; if, on the

other hand, they have a nature in themselves apart from relations, how do we come to know, consistently with the relative nature of knowledge, that they have such a nature?

Inability of Reason to solve certain questions may be shown, says Mr. Spencer, without implying its general incompetence, "if its deliverances, valid within a certain range, themselves end in the conclusion that Reason is incapable beyond that range." But this is just the question. How can Reason determine that there exists a "range" beyond its own competence, and that that which lies within that range is the absolute reality of things? How can Reason determine that what we know is not the real, and that we do not know is the real?

Mr. Spencer's inductive proof, when we look at it closely, proves to be just the deductive proof over again. Only, instead of things in themselves, we have now Matter in itself, Motion in itself, Space in itself, Time in itself, Force in itself. In other words, the fact that contradictions arise when we treat abstract elements of reality as independent totalities is made a proof that we do not know these elements as they are in themselves. But in this way we can make as many contradictions as we please, if we tear away a relative term from its correlative, or treat an abstraction as if it were an independent existence. For this is just to speak of that which can only be comprehended as a part, as if it were the whole. Why should we say that this is a weakness of thought any more than it is a weakness of thought that we cannot conceive an inside in itself without an outside, or concave without convex, or even a father without a son? It is absurd to seek for the Absolute apart from the Relative, the Thing in itself apart from its relations, Matter apart from Form, Force apart from its expression. And the same is true of all abstract elements of existence, even though their relativity may not at once be obvious in our first conception of them. "Space," says Mr. Spencer, "is the abstract of all relations of co-existence, Time is the abstract of all relations of sequence" (p. 11). If so, it is no great difficulty that the notions of Space in itself, and Time in itself, give rise to contradiction. Universalise an abstraction, treat it as without limits, and it must break down and become self-contradictory. But this is simply the way in which it shows its relative character—shows that it is a part and not the whole. The solution of such contradictions is to be found, not by keeping the ideas in question in their abstraction, but by advancing to more complex ideas, which include, but at the same time transcend them. It is the strength of thought, not its weakness, that gives rise to such contradictions, as it would be a proof of weakness, and not of strength, if we could conceive of abstractions as absolutely real—that is, as complete in themselves. It is the highest aim of Science and Philosophy, indeed, to rise above the abstract and partial way of knowing things with which we begin and in which we treat everything as a totality by itself, and to attain to that higher mode of knowledge in which we may see all things as related to each other, and so find the whole

in every part. And if we cannot attain absolute knowledge, it is only because we cannot complete the all-embracing circle of relations; because we continually stop short at abstract and partial views, which, as such, always contain a contradiction, in so far as they pretend to be complete. It is a relic of the old scholastic mode of thought to which Mr. Spencer still clings, when he goes back to the first form of knowledge in which things are conceived as all but entirely isolated and unconnected with each other, and supposes that we should attain the absolute truth if the isolation could be made complete.

In answering Dr. Hodgson, who had argued that Mr. Spencer uses ideas which he himself regards as contradictory and inconceivable as the basis of his philosophy, Mr. Spencer points out that the basis of his philosophy is the consciousness of an ultimate reality, a consciousness that does not disappear with the contradictions which arise when we attempt to conceive or define it.

"Reality," he argues, "though not capable of being made a thought properly so called, because not capable of being brought within limits, nevertheless remains as a consciousness that is *positive*, is not rendered *negative* by the negations of limits."

"The error fallen into by philosophers intent on demonstrating the limits and conditions of consciousness, consists in assuming that consciousness contains *nothing but* limits and conditions, to the entire neglect of that which is limited and conditioned. It is forgotten that there is something which alike forms the raw material of definite thought and remains after the definiteness which thinking gave to it has been destroyed, something which ever persists in us as the body of a thought to which we can give no shape" (p. 273).

Beyond the relation is the related, beyond the limit is the limited. But *what* is it? We may admit that the beginning of knowledge consists in the consciousness that "something is," in the opposition, that is, of an object to the subject. But why should Mr. Spencer consider that this first of all judgments, this first position of thought involves the existence of an absolute thing in itself out of relation to thought? We cannot separate, though we may distinguish by abstraction the judgment "Something is" from "I think it," any more than we can separate the judgment "It is this" from "It is not that." The "basis" of knowledge is like everything else that is reared upon it, it involves difference and distinction; but it also involves the relativity of the elements distinguished, and therefore the unity of the thought that apprehends them. Here again, however, Mr. Spencer seeks to reach reality by abstraction, and repeats the mistake of the scholastics, that whatever things can be distinguished really exist as separate and independent entities.

In a passage quoted (p. 291), Mr. Martineau presses Mr. Spencer with the argument that the Relative and Finite is simply one term of a relation, and that we must either admit that we know nothing of the Relative and Finite, or else, that we know both it and the Infinite and Absolute with which it is correlated. If they be taken as relative terms, we can know both the Finite and the Infinite, the Relative and the Absolute. If they be not taken as relatives, we can attach no sense to either of them,

and the assertion that we cannot know the Infinite and the Absolute is an assertion that conveys no meaning whatever. "The same law of thought which warrants the existence, dissolves the inscrutableness of the Absolute." To this Mr. Spencer answers, that when he uses the word Absolute or Non-relative, he understands it as meaning "the totality of Being, *minus* that which constitutes the individual consciousness, present to us under forms of Relation," and not in the "Hegelian sense, as comprehensive of that which thinks and that which is thought about." His Absolute, therefore, always is "that which in any act of thought, is outside of and beyond it, rather than that which is inclusive of it." And of this he does not speak as a "conception," but merely as a "consciousness."

This is simply saying, in other words, that in his conception of Being, Mr. Spencer leaves out the relation to self-consciousness, and then finds that the remainder is inconceivable. And, indeed, we must allow that a "consciousness" which has no relation to a conscious self is utterly inconceivable. But what ground has Mr. Spencer to say either that there is such a consciousness, or that its object exists?

In order to illustrate the possibility of holding the inconceivable in some vague manner in thought, in some "dim consciousness," Mr. Spencer speaks of the difficulty of conceiving the ninety-two millions of miles that separate us from the sun. We can, he thinks, conceive an inch with perfect clearness, a mile less distinctly, but as to ninety-two millions of miles, we cannot grasp in our conception either that distance or its relation to one inch. And, indeed, if to conceive means to hold a picture before the imagination, it may be allowed that we cannot even conceive of one mile very distinctly. For in this point of view the limits of imagination are not greatly wider than the limits of sense. But we can *understand* what is meant by ninety-two millions of miles as well as what is meant by one mile or one inch. Our arithmetical system, dealing with number in the abstract, enables us to understand the greatest equally with the smallest number, and gives perfect definiteness to the relation of the smallest and the greatest quantity. But Mr. Spencer, starting from this inadequate illustration, proceeds in the following way:—

"This partial failure in the process of forming thought-relations, which happens even with finite magnitudes when one of them is immense, passes into complete failure when one of them cannot be brought within any limits. The relation itself becomes unrepresentable at the same time that one of its terms becomes unrepresentable. Nevertheless, in this case it is to be observed that the almost blank form of relation preserves a certain qualitative character. It is still distinguishable as belonging to the consciousness of extensions, not to the consciousness of forces or durations; and in so far remains a vaguely-identifiable relation" (p. 294).

An example of the kind of "vaguely-identifiable relation" of which Mr. Spencer speaks, may be taken from Spinoza's twenty-ninth Epistle, in which this question is treated in a manner that has never been surpassed. Suppose we have two circles, not concentric, the one of which is enclosed

within the circumference of the other, and suppose it to be required that we should enumerate the number of inequalities of distance between their respective circumferences. Obviously the problem is an insoluble one, though the space or "extension" to be measured is perfectly definite. Here Mr. Spencer might say that the line by which we measure one distance has a relation to the whole extension, but a relation that cannot be defined. But the real solution of the difficulty is, that a straight line, the abstraction of direction, is incommensurable with a plane surface. There is no failure of reason except to establish a relation of number where no relation of number exists. We cannot answer a question which itself contains a contradiction. The next step brings Mr. Spencer to the conclusion of his argument:—

"But now suppose we ask what happens when one term of the relation has not simply magnitude having no known limits, and duration of which neither beginning nor end is cognizable, but is also an existence not to be defined? In other words, What must happen if one term of the relation is not only quantitatively, but also qualitatively unrepresentable? Clearly in this case the relation does not simply cease to be thinkable, except as a relation of a certain class, but it lapses completely" (p. 295).

The answer to this is simply that if we define a thing as that which is not to be defined, we cannot, of course, give any further definition of it, and the "dim mode of consciousness" which Mr. Spencer supposes to remain in regard to it, is a pure assumption. Of course, when we proceed by abstraction, as Mr. Spencer does, to omit one determination or property of things after another, we come at last to the notion of bare Being without any predicates. The abstraction of Being is the beginning of knowledge, the first in synthesis, and therefore it remains as the last in analysis. But even this first conception, as we have shown, is relative, though its relativity is not fully developed. Being implies at least Not-Being, and there is no especial "dimness" in our conception of it, except that which arises from its abstractness. It is quite clear, unless we seek for more than is to be found in it; we can without difficulty know all about it that there is to be known. If Mr. Spencer would accept a lesson from Hegel, he would seek for the absolute not in the beginning of knowledge but in its end; but while he insists in finding the absolute reality in the object in itself, abstracted not only from the *individual* subject or consciousness, but from *all* consciousness, and again in Being in itself abstracted from all determination, he is simply attempting to perform a psychological feat analogous to the gymnastic feat of leaping off his shadow. The only way in which he can perform either is by leaping into the dark.

In Mr. Spencer's encounter with Mr. Sidgwick, the same difficulties reappear in another shape. Mr. Sidgwick points out (ACADEMY, vol. iv., p. 131) that while Mr. Spencer defends the crude realism of common sense, that is to say, the ordinary belief in an object altogether distinct from and independent of consciousness, he yet rejects entirely the common-sense view as to the nature of that

object. Common sense regards the object or "non-ego, as *per se* extended, solid, even coloured (if not resonant and odorous). This is what common language implies; and the argument by which Mr. Spencer proves the relativity of feelings and relations, still more the subtle and complicated analysis by which he resolves our notion of extension into an aggregate of feelings and transitions of feelings, lead us away from our original simple belief—that (*e.g.*) the green grass we see exists out of consciousness as we see it—just as much as the reasonings of Idealism, Scepticism, or Kantism." To this Mr. Spencer answers that here he is only doing what science always does when it substitutes a new explanation of things for the vulgar or common-sense explanation of them. The astronomer does not deny the reality of the facts which give rise to the vulgar belief that the sun moves round the earth, but only substitutes a correct for a false interpretation of those facts. In like manner Mr. Spencer admits the judgment of common sense, in so far as it asserts that there is a real object independent of the subject, though he explains the properties attributed to that object in a different manner. But the Idealist is like one who, from the various anomalies following from the common-sense interpretation of the celestial appearances, should draw the conclusion that there externally exist no sun and no motion at all. To this Mr. Sidgwick would no doubt answer that the illustration fails just in the point it ought to illustrate. The astronomer finds he can better explain the celestial motions by a change in his own position than by a change in the position of the sun and the other heavenly bodies. In like manner, the philosopher, starting with the crude realism of common sense, with the belief in the existence of an object completely independent of consciousness, gradually discovers that all the qualities which the object presents are relative to consciousness, and is thus led to give up his belief in any reality that is not relative. But Mr. Spencer, although he explains the reality we know as relative to consciousness, yet insists on maintaining the vulgar belief, that in addition to this there is an unknowable reality out of all relation to consciousness. If, indeed, there be any "Idealist" who maintains that there is no other reality existing except his own *individual* consciousness, we surrender him to the mercy of Mr. Spencer and to his own unhappy fate. What we had supposed Mr. Spencer to be maintaining, was the existence of things in themselves unrelated to consciousness in general, and which therefore by the very definition of knowledge cannot be known, and it is that view to which Mr. Sidgwick's objection is fatal.

Mr. Sidgwick next goes on to show that Mr. Spencer's dualism is not confined to his view of the relation of the knowable and the unknowable. It reappears in relation to the knowable. In interpreting the phenomena of consciousness, Mr. Spencer "continually postulates not an unknown something, but something of which he speaks in ordinary terms, as though its ascribed physical characters really existed as such," independent of consciousness, although he admits that "our states of consciousness are

the only things we can know." There are thus two distinct explanations of things which are parallel to each other, and have no point of connexion. We may explain all things as states of consciousness, we may explain all things equally as attributes or relations of matter; and between the two explanations there is a great gulf fixed, so that we cannot pass from one to the other. Mr. Spencer answers that he had himself pointed out this duality, or "fundamental incoherence," as Mr. Sidgwick calls it, in his *Principles of Psychology*, but he thinks that it is an incoherence, "not between his own two expositions, but between the two consciousnesses of subjective and objective existence." In other words, it belongs to the human mind and not to Mr. Spencer's philosophy. Knowledge is thus fundamentally incoherent, even within the range of the knowable, for it consists of two distinct forms of consciousness, which exist together in our minds, but which we cannot bring into unity. Not only is thought the resultant effect of two factors which we cannot know in themselves, but also the product continually reproduces the duality of the unknown subjective and objective activities, which are its causes. Here again we have what Kant called "a nest of contradictions." In the first place, Mr. Spencer does not tell us how he reaches the point from which he can see thought to be produced by the action of two factors, which we know only through their combined result. In the second place, even supposing knowledge did spring from the action of two separate factors, this duality out of our knowledge would not explain how there should be an absolute duality in knowledge. One would have expected that when the unity of consciousness was once produced, any duality appearing in it would be only a relative duality, that is to say, a duality of elements related to each other, and held within the compass of the unity. One would not have expected to find consciousness itself breaking up into "two consciousnesses," neither of which can be resolved into the other. Lastly, if there is no such unity of consciousness, how is it that we can compare the objective and the subjective consciousness, and discern that they are parallel to each other? Mr. Spencer's own conception of the relativity of consciousness is at variance with this conception of its absolute duality. He seems almost to forget that he who apprehends a relation has already reached a unity that is beyond the difference of its two terms.

There are some other points of interest in Mr. Spencer's "Replies," particularly his strange representation of Kant's meaning (p. 269), but it would take too much space to discuss the subject here.

EDWARD CAIRD.

Dictionary of the Old English Language; compiled from Writings of the Twelfth, Thirteenth, Fourteenth, and Fifteenth Centuries. By F. H. Stratmann. (Krefeld: printed for the Author. London: Trübner. Second Edition. 1873.)

In estimating the merits of a dictionary of any language, the first question we naturally ask is, what is the author's ideal of such a

work? and secondly, how far has he succeeded in carrying out his self-imposed task? If he appears to have conscientiously utilised all the materials at his command, the result, however imperfect in itself, deserves the fullest recognition. No one looks for anything approaching perfection, either as regards quantity or quality, in a dictionary; least of all in one which, like the present work, is the first of its kind.

We ask, then, what are we to understand as the scope and object of Dr. Stratmann's dictionary? His title-page shows clearly enough that he understands by "Old English" the whole period which extends from the break-up of the old inflectional system to the loss of the final *e*, and rise of modern English—including at the one end Layamon and the other Semi-Saxon writings; at the other, Lydgate and Occleve. Accordingly he gives a long list of authorities, extending over eight pages, which seems to comprise all, or nearly all, the texts hitherto published.

We look in vain, however, for any indication of the plan on which this vast mass of material has been worked up; the only information given about the general character of the work and the relation of this second edition to its predecessor, besides what we glean from the title-page, is contained in an "advertisement" of remarkable brevity, which we quote in full:—

"The present edition of the Dictionary of the Old English language has not only been revised and enlarged, but written anew from one end to the other, so that there will be found few lines in which the amending hand is not visible. But, although in many respects improved, it can, of course, not be said to be perfect. The author, therefore, intends to publish a Supplement to it as soon as material sufficient for a volume has been collected, and he will be happy to receive communications for that purpose from fellow-students. For the present work he has to acknowledge the kind assistance of Mr. F. J. Furnivall and the Rev. W. W. Skeat."

This is a very vague statement: all we really learn from it is that the second edition is an improvement on the first—of the amount and quality of the improvement we are told nothing.

Putting all things together, however, it seems clear enough that the work professes to be a complete dictionary of Middle English—complete, at least, in as far as all the words contained in the authorities cited in the introductory list are given, with references enough to guarantee correctness. A dictionary which does less than this has really no claim to the title of dictionary—it is merely a glossary or selection.

Now the most conspicuous defect of Dr. Stratmann's first edition was that it failed to satisfy this primary and indispensable requisite of completeness: the words of French origin, especially, were registered in a most careless and meagre style. One of the reviewers of the work in Germany, after giving a long list of omitted French words, went on to conjecture that the compiler had originally confined his attention to the Teutonic elements only, and that the addition of the French words also was an after-thought.

That Dr. Stratmann should have thought fit to publish his dictionary in this imperfect

state, instead of waiting a few years—a delay by which the work would have profited in many ways—is not calculated to inspire confidence in the soundness of his work generally, nor is the fact that he has not anywhere given the reader the slightest warning of this defect in his book, of which he must have been fully aware, likely to diminish our distrust of the quality of his work. We had hoped that whatever might be the defects of the second edition, this omission, at least, would be rectified, and that it would be tolerably complete as far as the French element is concerned. This hope has, we regret to say, not been realised. Although many of the French words have been registered, others of equal importance have been omitted. The reader need only glance through Mr. Ellis's text of the Prologue to the *Canterbury Tales* in his *Early English Pronunciation*, where the words of Romance origin are printed in italics, to find that whatever may be the merits of Dr. Stratmann's dictionary, it is of next to no use in reading the greatest of all Middle English poets, whose writings are full of naturalised French words, many of which are extinct in modern French, and must be sought in an Old French dictionary, which, unfortunately, does not yet exist.

The purely English vocabulary is also far from complete, even in the words of the Transition or Semi-Saxon period, which evidently has a special interest for Dr. Stratmann. In short, as Dr. Stratmann's warmest supporter in England, Mr. Furnivall, remarks, in his contribution to the second annual address of the President of the Philological Society, "Unluckily Dr. Stratmann did not conceive that his duty was to register *all* the words found in our printed texts from MSS. of the dates assigned in his title; and I believe that his book must be at least trebled in bulk (or number of entries), before it can supply the student with all he requires in a real Early English Dictionary."

Mr. Furnivall goes on to state that "Dr. Stratmann is now hard at work on a Supplement to his excellent book, so that the defect I have spoken of is in course of being remedied." As the present edition already has nearly ten pages of additions, the result will be that when the promised Supplement appears, the unhappy student will have to look up many words no less than three times, with a very dubious prospect of finding them in the end. Looking for words in Dr. Stratmann's dictionary has all the excitement of a game of chance, but has the disadvantage of wasting a good deal of time.

The treatment of the words that have been admitted into the dictionary is far from satisfactory. A considerable variety of forms is given, but they do not seem to have been selected on any definite principle, nor are they classed according to dialect and age, while a disproportionate space is given to long lists of words from the cognate languages,—Old High German, Icelandic, &c., together with Sanskrit roots (printed, too, in Sanskrit letters), all of which are quite out of place; a reference to the oldest English or French forms is quite enough. The discrimination of the various shades of

meaning and of the syntactical usage of the various words, especially of the particles—the crucial test of all higher dictionary work—is very superficial and incomplete.

It is quite clear that Dr. Stratmann has undertaken a task far beyond his powers, and has carried it out in such a hasty and slovenly style that we cannot but regard the result as eminently discreditable to German philology, which, whatever may be its shortcomings, has always been distinguished for laborious and conscientious work.

The bad quality of Dr. Stratmann's work appears quite inexcusable, when we consider how entirely gratuitous the enterprise was. There was nothing at all to prevent him from making a dictionary of the Germanic as opposed to the Romance elements of Early English, if he chose to do so, provided only the fact of the work being so limited had been distinctly stated on the title-page. It was equally open to him to take some special period, or even a single author, and produce a really solid piece of work, which would form a secure basis for future investigations: as it is, the greater part of the work will have to be done over again. We do not say that the book is useless—far from it: the mass of accurate material that has been collected is of high value, and must make the work indispensable to all Early English students, but it is, at most, a stopgap, which we hope to see superseded as soon as possible.

H. SWEET.

THE LATE PROFESSOR PHILLIPS.

PROFESSOR JOHN PHILLIPS, M.A., F.R.S., &c., aged seventy-three last Christmas Day, was of Welsh descent, though born in Wiltshire. He was vigorous and actively employed up to the day of his lamented death, looking forward to the almost immediate issue of a new edition of the first volume of his *Geology of Yorkshire*.^{*} He was long associated with York and its great county, whose antiquities, physical features, products, and geology he has so attractively described and illustrated in several works and maps. For, after the publication of the great Geological Map of England had brought William Smith into repute, leading to his further survey of many parts of England and an enthusiastic teaching of his favourite science, he was invited, in 1824, to lecture to the Yorkshire Philosophical Society, then newly founded at York; and he took with him John Phillips, his affectionate nephew and ward, who had grown up to be his valued companion, pupil, assistant and fellow-worker. The society's collection of fossils was arranged by the young geologist, who became in 1826 the curator of the museum, now standing on the site of St. Mary's Abbey, and well known for its treasures of natural history and antiquities. Here also, in 1831, Phillips and others originated the British Association for the Advancement of Science, which, set afoot the next year at Oxford by Buckland's energy, has progressed so grandly since, not without Phillips as secretary for many years, and as president in 1864.

In 1834, he was appointed Professor of Geology in King's College, London; and in 1844, in Trinity College, Dublin. He succeeded the lamented Hugh Strickland, in 1853, as Assistant-Reader in Geology, at Oxford, and three years afterwards, on the death of his old friend Buckland, he was appointed Reader or Professor in his place.

In the meantime he had worked with De la Beche in the National Geological Survey, as is especially seen in the maps, sections, and memoirs

illustrative of South Wales, the West of England, and the Malvern and Abberley districts. In some of these, as also in other works, his knowledge of zoology aided him in the description of fossils drawn with his own hand.

In 1845 he was honoured with the Wollaston Medal of the Geological Society, and held its presidency in 1859-60. He was honorary member of many societies; universities conferred on him honorary degrees; and only a few weeks ago the Turners' Company in the City recognised his services to science and the arts by giving him the freedom of their guild.

In his *Guide, Manual*, and other text-books of geology, Phillips taught the advanced geologist as well as the student; for original observations are carefully blended with well-digested information. Indeed, in these and his other books we see the work of personal knowledge derived from wide research and sound experience—not merely of the specialist, for the geological surveyor is here also a thoughtful naturalist and a cautious philosopher.

When we remember that astronomy, meteorology, and terrestrial magnetism were among his mental occupations, and practically took up much of his attention, we can but look on him as a man of rare accomplishments and great energy.

Learning and teaching whilst young, teaching and still learning in advanced life, consolidating scientific ideas and making them useful to the world, John Phillips fulfilled his best instincts and his duty. Working throughout the British Isles, and elsewhere, in collecting knowledge and distributing it through the great intellectual centres, London, Dublin, and Oxford, to so many succeeding circles of students, and, by numerous writings, to all the world, he freely gave of what he had amassed; he added treasure to the intellectual wealth of many minds, and indeed material wealth to some of the industries of his country, and he has left a good name behind him.

Royal Commission on Scientific Instruction and the Advancement of Science. Vol. ii. *Minutes of Evidence*, &c.

THIS volume contains the second and apparently the final instalment of the evidence given before the Royal Commissioners. The former volume of evidence attracted considerable public attention from the unanimity with which scientific men were found to express their opinion upon the necessity for organising forthwith in this country the national endowment of scientific research. The chief interest of this volume consists in the schemes put forward for the satisfaction of this general need; and in this matter also the outside world will be impressed with the consensus of opinion in favour of a complete change in the relations between the Government and the physical sciences. Not only the professors of each particular science, but also those members of the public departments whose duties are of a scientific character, would seem to be all agreed upon the general outlines of a plan which at first sight appears startling in the boldness of its conception. Colonel Strange and General Strachey, both of the India Office, must have the credit for the first presentation of this plan to the Commissioners in a complete shape, and for the trouble with which they have elaborated its details and pressed it upon the attention of their scientific friends. The project is no less than to raise science, and all that is concerned with scientific instruction and scientific research, into a new Department of State, with a permanent Council of scientific men, to form the constitutional advisers of the Government on all questions where scientific knowledge is required. This proposal was strongly supported by the Hydrographer to the Admiralty, and by the Permanent Secretary to the Board of Trade, as well as by Mr. Reed, the late Chief Constructor of the Navy, so that it may be fairly assumed that it would be of utility to the national service, as

^{*} The preface was dated May 1, 1874.—Ed.

regarded from the point of view of those who are most directly responsible for the evils that at present result from scientific ignorance in high places. It was natural that men who, by a lifetime devoted to scientific investigation, have learned the dignity and importance of their pursuit, should join in the advocacy of a Council of Science; and, on the main question, Sir W. Thomson, Sir H. Rawlinson, Captain Galton, and Messrs. Joule, De la Rue, B. Sanderson, and indeed nearly all those whose opinions were asked, were in harmony. On minor matters there is considerable divergence of opinion; some would have a Cabinet Minister of Science, some wish merely for a Science Sub-committee of the Education Department, while others would raise to an official position delegates from the Royal Society. Different views were expressed also on other details: whether the members of the Council should be highly salaried, or paid merely by a moderate retaining fee, or whether their services should be entirely gratuitous; but it may be hoped that the Royal Commission, when they present their final report on this important subject, may be able to discover some way by which this promising scheme may be carried into effect without offending more people than it would satisfy. It should be added, that the opinions of Lords Salisbury and Derby, and Sir Stafford Northcote, who were specially consulted with reference to the establishment of this Science Council, were distinctly adverse to it, on the ground that it could not work well with our present parliamentary and administrative arrangements.

The establishment of state laboratories, for original investigation in physics, chemistry, and physiology, is another measure on which the evidence given in this volume is almost unanimous; and it was strongly urged by Sir W. Thomson, Professor Frankland, Messrs. De la Rue, and Gore, that these laboratories should rather be the homes of original research, than merely schools for scientific instruction. Professor Frankland pointed out that it was one of the characteristics of English science, that important investigations are so largely carried on by men who are in no way engaged in teaching, and who never have been so engaged; and that it would be an immense stimulus to investigators of this kind, of whom England may well be proud, that national institutions supplied with the more expensive instruments should be open to their use. Mr. De la Rue strengthened this argument by appealing to the history of the College of Chemistry; which was originally founded by the voluntary efforts of a body of energetic workers, who were desirous of undertaking original investigation, but which has now, owing to the want of public aid, become unable to maintain its independent character, and has been absorbed by the School of Mines.

A great deal of evidence was also given with reference to the only subsidy from the public funds at present allowed to original research, the 1,000*l.* annually voted to be distributed by the Royal Society. It is curious to learn certain matters regarding this grant. It was first volunteered by Lord Palmerston, and accepted by the society with some reluctance; and although now it is on all sides regarded as a most niggardly recognition of the national duty towards scientific investigators, Lord Palmerston at the time offered to make it 10,000*l.* if the society would only say the word. Even out of the present scanty sum, according to the accounts printed at the end of this volume, after balancing the grants and appropriations of the last sixteen years, 1,000*l.* has been repaid to the Treasury, and 1,600*l.* is left in hand. It is now suggested by the majority of the witnesses that the annual grant should be increased ten or twenty fold; and no one need demur to the demand, though surprise may be felt at the confessed inability of these very witnesses to find recipients for the whole of even the smaller sum.

Another important feature of this volume is the evidence given by politicians with regard to the

practical possibilities of the various subjects. It is presumably due to the circumstance that the Commission was called into being by the late Government, that none of the Liberal ministers gave their evidence on this matter; but to those who might be otherwise indifferent to the change of parties, it will be interesting to observe that at least two among the foremost members of the present Cabinet have given a pledge to support the national endowment of scientific research, and to reform the Universities in that direction. Both Lord Derby and the Marquis of Salisbury unhesitatingly avow their conviction "that the State may legitimately assist in giving aid to the advancement of science; because in that industry the results are not immediate, they are not popular in their character, and they bring absolutely no pecuniary advantage to the investigators." Sir Stafford Northcote speaks on the main question with the characteristic caution of a future Chancellor of the Exchequer, yet he agrees with his two present colleagues in stating "that the present endowments for education must be better utilised for the purposes of science than they now are before any public votes come from the public money." On this matter Lord Salisbury is particularly explicit, and his position as Chancellor of the University of Oxford cannot but give weight to his advocacy of the project by which the surplus revenues of the wealthy universities and colleges, may be utilised in establishing "scientific deaneries." He is careful to state that the duties attached to such posts should in his idea be merely nominal; but that out of deference to public opinion, it would be desirable to impose upon their holders the necessity of publishing, in some shape, an account of the result of their labours during each successive year.

It may also be noticed that the practical mind of Mr. Farrer, the Secretary to the Board of Trade, himself an Oxford man, inclines to the conclusion that the House of Commons will not consent to make a large application of public money to scientific research, "whilst the enormous endowments of the Universities remain as at present diverted from the purposes of learning and knowledge, and which would be able by themselves, if properly applied, to do almost all that science requires."

It must be admitted that among the witnesses some expose themselves to the charge of being over careful to air their own peculiar grievances. Mr. Reed takes the opportunity of explaining how the *Captain* was lost; the Irish Professors in a body complain of the hardships under which Catholic students suffer, and of the jobbery which extends to all scientific appointments; while the Scotch retort in an elaborate document that the assistance which their own men of science receive from the State as compared with that received by the Irish bears no proportion to the amount which the two countries contribute to the national exchequer. In contrast to these somewhat petty questions, it is pleasant to read that Professor Owen has no change to advocate with reference to the government of the British Museum; that General Sir E. Sabine is perfectly satisfied with the present condition of the Meteorological Department; and that, on the authority of Mr. Slater, the Zoological Society obtains sufficient funds from its gardens to answer all its scientific wants.

In conclusion, there should be noticed in the Appendix a short communication from Professor Bain, of Aberdeen, in which he protests in the name of his own chair of Logic and Moral Philosophy against the arbitrary limitations which the Commissioners have imposed upon the interpretation of the name "Science." He rests his argument on the ground that there are other studies which, being pursued in a scientific spirit and in accordance with scientific methods, cannot, without injury to the solidarity of human knowledge, be thus roughly severed from the physical sciences: and before the Universities are reorganised in

agreement with the views of this Commission, it would certainly be well that his arguments should meet with their due consideration.

NOTES AND NEWS.

THE *Revue des Deux Mondes* for April 15 contains an interesting article from the pen of M. de Tastes, on Synoptic Meteorology and Weather Prevision. The paper is, however, disappointing, as it is written from a point of view too exclusively French, and almost ignores everything which has been done in other countries to advance the science of weather knowledge. At the same time it is only fair to admit that it contains a notice of some of the more important results attained in that department of science.

The only organisation of which the author speaks, as deserving serious notice, is that of the Observatoire de Paris, the only meteorological bulletin, the *Bulletin International*; while in this country telegraphic weather reports have appeared in the papers since 1861, have been lithographed since 1869, and, with weather charts, issued to subscribers since March 1872; not to speak of the Russian bulletins, and the *Bulletin Météorologique du Nord* (published at Copenhagen), both of which are of recent date.

M. de Tastes says: "De toutes parts en Europe, on s'est lancé dans cette voie nouvelle de la météorologie synoptique;" he is surely unaware that in his first Annual Report (for 1857, Appendix II), Admiral Fitz-Roy issued the first circular inviting observers on land and at sea to send in simultaneous observations.

When speaking of cyclones the author refers to M. Bridet's work on the *Hurricanes of Réunion*, but he ignores the fact that too close an adherence to M. Bridet's rules is considered by competent authorities, such as Mr. Meldrum, to have occasioned the loss of several vessels on a recent occasion. Here, too, the labours of Redfield and Reid are totally disregarded. No mention is made of Buys Ballot's name, and yet the universal acceptance of his Law has been the most important step which weather knowledge has made during the last fifteen years.

The most amusing inaccuracy in the paper is in regard of storm warnings, where M. de Tastes, following an incorrect phrase in the *Bulletin International* of March 26, says: "Ce système d'avertissement aux ports, qui fonctionne depuis plusieurs années en France, et qui avait été interrompu en Angleterre depuis la mort de l'Amiral Fitz-Roy, vient d'y être rétabli, à partir du 14 Mars dernier," &c., &c. M. de Tastes does not know that Admiral Fitz-Roy's system was maintained for eighteen months after his death, nor that since January 1, 1868, after only a single year's interruption to the warnings, signals of storms (drums) have been hoisted on the coasts of the United Kingdom, although it was only in March 1874 that the use of Admiral Fitz-Roy's cones was restored.

Not only, however, have warnings been issued regularly to our own coasts for six years past, but also, at the special request of the Ministère de la Marine in Paris, to the coasts of France, from Dunkerque to Nantes; and it was only in September 1873 that the same office in Paris requested the sanction of the Meteorological Committee in London to a plan for the independent issue of warnings by the Préfet Maritime of Rochefort to the fourth Arrondissement (*Revue Maritime et Coloniale*, vol. xxxix., p. 372).

Practically, therefore, it is the Meteorological Office in London, and not the Observatoire in Paris, which issues warnings to the coasts of France! These arrangements, which have subsisted for more than ten years, have entirely emanated from the French authorities, and it rests with them to terminate them, as is abundantly shown by the correspondence on the subject presented to Parliament in 1868 (*Parliamentary Paper* No. 181 1868).

SIGNOR LUIGI CALORI has contributed to a late part of the Memoirs of the Bologna Academy of Sciences an elaborate paper on the ancient skulls of various races buried in the old Necropolis of Bologna, which is illustrated by seventeen plates of skulls and skeletons.

THE last volume of the *Atti della R. Accademia delle Scienze Fisiche e Matematiche* of Naples, contains a paper by Signor Luigi Palmieri on the Eruption of Vesuvius on April 26, 1872, with five views of the mountain as it appeared before, during, and after the eruption.

ONE of the objects that attracted great attention at the Royal Society's *soirée* on the 22nd ult., was a very remarkable group of living corals (*Astroides calicularis*) from the Bay of Naples, which was lent for the occasion by the Crystal Palace Aquarium Company.

THE *American Naturalist* bears pleasant testimony to the zeal with which natural history and kindred sciences are cultivated in the New World. The numbers for February, March, and April of this year, now before us, contain much valuable matter, of which we can only mention a few portions. Mr. Comstone contributes a couple of papers on that amazing tract of country called "Yellowstone National Park." (See ACADEMY, vol. v. p. 83.)

Professor O. C. Marsh contributes a paper on "The Structure and Affinities of the Brontotheriidae," great fossil creatures from the Miocene beds of Dakota, Nebraska, Wyoming, and Colorado. They belong to the Perissodactyls, or "odd-toed" quadrupeds, and are huge animals, interesting, amongst other things, for supplying some of the connecting links so much sought for by geologists and comparative anatomists. They seem to have affinities with the Rhinoceros family, also with the Proboscidea (elephants, &c.), which succeeded them in the geological series, and with their predecessors, the Dinocerata.

The March number opens with one of the last papers written by Agassiz, on "The Teething of the Selachians" (sharks, &c.).

An account of dredging "Explorations of the Gulf of Maine," by A. S. Packard, Jun., brings out the interesting result that "the fauna of the deeper portions are almost purely arctic; the temperature at about 100 fathoms being from 36½ to 39°."

Professor Verrill illustrates "The Giant Cuttle Fishes of Newfoundland and the Common Squids of the New England Coast." From portions of the huge creatures that have reached him, it is evident that "two kinds of gigantic squids exist on the coast of Newfoundland." "The body of one must have been fifteen feet long and nineteen inches in diameter; the ordinary arms about ten feet long and seven inches in diameter, and the two extensible arms of unknown length." It is thought to be the *Architeuthis monachus* of Steenstrup. Another, with a body ten feet long, had extensible arms about forty-two feet long. It was supposed to be Steenstrup's *Architeuthis dur.* A smaller specimen, caught in herring nets in Logic Bay, about three miles from St. John, had

"a body more than 7 feet long, and between 5 and 6 feet in circumference. The caudal fin was 22 inches broad. . . . The two long tentacular arms were 24 feet in length, and 2½ in circumference, except on the broader part near the end. The tips were slender and acute; the largest sucker 1.25 inch in diameter, with serrated edges; the eight short arms were each 6 feet long; the two largest were 10 inches in circumference at base. The others were 9, 8, and 7 inches, and each bears about 100 large bell-shaped suckers, with serrated margins. Each of the long arms bears about 160 suckers on the broad terminal portion, all of which are denticulated."

Mr. Jordan (April number), describing the "Flora of Penikese Island," gives a curious illustration of the changes that may be produced in the vegetation of a district by the introduction of a new animal. Formerly this island abounded in trees,

such as red cedar, pitch pine, red maple, &c., but of this growth scarcely any traces remain. The trees perished in the struggle against grass and sheep.

Naturalists have noticed that in different parts of England birds of the same species have local peculiarities of note and song. This is observed in America by Mr. Ridgway. He finds the *Cardinalis Virginianus* has a much finer song in Southern Illinois than in Maryland; and the Baltimore oriole sings better there than near Warlington. Certain birds of the Potomac Valley, and those of the valley of the Lower Wabash, differ in that the former "sing as if afraid of being heard." Other species sing as loud as elsewhere. If the soft singing incurs less danger, this peculiarity would increase by inheritance, as Darwin has pointed out.

Among geological discoveries may be mentioned the finding of fragments of a Sigillaria in Lower Silurian beds near Lebanon, Ohio, older than any land plants previously known; and the investigation by Professor Le Conte of the great lava region of California. He believes the mass of this lava issued from fissures in the Coast Ranges, and still more from the Cascade and Blue Mountain Ranges, and it covers an area greater than all France.

Mr. Palmer describes a curious property of the red berries of *Rhamnus croceus*, which the Opache Indians eat. The colouring matter is taken up by the circulation, and diffused through the system, so that "the skin exhibits a beautiful red network."

THE French Acclimatisation Society has just held its seventeenth annual meeting at the Grand Hotel, Paris. M. Drouyn de Lhuys, the President, gave an account of the naturalisation of coffee, and M. Henri Bouley, of the Institut, delivered a lecture on the domestication of animals.

A NEW comet was discovered by M. Coggia, at the Marseilles Observatory, on April 17. This object is quite invisible to the naked eye, being only 2' in diameter, but it is impossible to say as yet what the chances are of its ever becoming a conspicuous object. Mr. Hind secured an observation of it at Twickenham on Monday last.

THE Dresden papers report that seventeen experiments have been made during the present year with invariable success in the hospitals of that city to infuse lamb's blood into the human subject. In the first case tried the patient had long suffered from pulmonary disease, and the immediate effect of the operation was to raise the pulse, and impart a sense of greater strength. The large number of times which, according to the report, this old and often-tried, but never long-enduring method has been repeated with success, may possibly contribute to decide its merits, which have hitherto gained less credence in this country than among foreign practitioners.

FOR the relief of the traffic over London Bridge we hear that a company has been formed, under the name of the Southwark and City Subway Company, for the construction of a double tunnel from St. George's Church to Arthur Street West, on the City side of London Bridge. St. George's Church is at the junction of the Dover Road, leading to the Bricklayers' Arms Station, and the road from the Elephant and Castle. The trains on this subway will run on a line of rails of three feet gauge, at intervals of five minutes, the fares being fixed at one half-penny and one penny. The distance to be travelled is about three-quarters of a mile. The trains will be worked by a wire rope, and will run during sixteen hours of each day, having in a year a carrying capacity of over twenty million passengers, giving an estimated gross annual income of 68,000*l*.

THE annual report of the Meteorological Station at Hamburg, which has just been published, contains some interesting details with regard to the system at present in use for detecting and signal-

ling the approach of atmospheric disturbances. According to the returns published, no storms or other disturbances of a dangerous character occurred within 600 geographical miles of the Hamburg station without having been detected and recorded, even in cases where the disturbing waves diverged in the direction of central Norway and the Gulf of Bothnia. There seem to be abundant grounds for assuming that the central portion of the majority of the winter storms which visit Hamburg come from Iceland and the Faroe Isles, over the Shetlands and the upper part of the German Ocean, and that they then diverge, either over central Norway and Sweden to the Gulf of Bothnia, or southward through the Skagerac and southern Sweden to the Baltic. In the former case, the sky at Hamburg will be overcast, a drizzling rain comes on with more or less strong winds from S.W. to N.W., having a velocity of from twenty-five to thirty miles. In the latter case, hurricanes of wind will be felt coming from S.E. to N. and N.E., with sudden alterations of temperature, ending in snow and hail. It is anticipated that when the atmospheric telegraphic connexion with Iceland and the Faroes is fully established, and warnings can be received a day sooner of the local disturbances at those spots, important results may be looked for with regard to the solution of various problems of meteorological disturbances which control the direction and force of storms.

MR. GEORGE C. ATKINSON has commenced a Catalogue of the Remarkable Trees of Northumberland and Durham in the last number of the *Natural History Transactions of Northumberland and Durham*, and he there describes an hypsometer, contrived by him in 1872, which enables the cataloguer to supply the girth at five feet from the ground, the spread of the branches, and the height of the various trees.

THE following is a list of candidates selected and recommended by the Council of the Royal Society for election as Fellows:—Isaac Lowthian Bell, F.C.S.; W. T. Blanford, F.G.S.; Henry Bowman Brady, F.L.S.; Dr. Thomas Lauder Brunton, Sc.D.; Prof. W. Kingdon Clifford, M.A.; Augustus Wollaston Franks, M.A.; Prof. Olaus Henrici, Ph.D.; Prescott G. Hewett, F.R.C.S.; John Eliot Howard, F.L.S.; Sir Henry Sumner Maine, LL.D.; Edmund James Mills, Sc.D.; Rev. Stephen Joseph Perry, F.R.A.S.; Dr. Henry Wyldbore Rumsey; Alfred R. C. Selwyn, F.G.S.; Major Charles William Wilson, R.E.—*Nature*.

A CORRESPONDENT of the *Times*, writing on the 18th ultimo, states that Herr Brugsch had read an important paper before a philanthropic school society at Cairo on the Exodus. From the hieroglyphic tablet, which has cast such a light on many dark places in ancient Egyptian geography, it appears that the city of Tanis was also called Ramsès. Herr Brugsch satisfied himself that the Pharaoh under whom Moses lived was Ramsès II., and that his son and successor, Ménephthah, was the Pharaoh of the Exodus. Near Mount Casius, in the north-east of Egypt, existed formerly the Serbonian Lake, which was subject to great inundations from the sea under certain conditions of wind. It was there that the Persian army of Artaxerxes perished in the same manner as the army of the Egyptian king, and there it is, says Herr Brugsch, that the latter perished in their pursuit of the Hebrews. He argues that the mention of "the Red Sea" only occurs in the "Canticle of Moses," a work composed a long time after the occurrence, and that in the true historical narrative of Exodus there is only mention made in a general way of "the sea," which was the Mediterranean. On this hypothesis all difficulties vanish. Tanis, Ramsès, Succoth, Migdol, Pithom, the Land of Goshen—hitherto the despair of all the theorists—can now be quite readily identified. It was not at

Memphis, nor at Heliopolis, that the Israelites gathered together to cross the Red Sea or to traverse the salt lakes between Suez and the re-filled bitter lakes on their way to the desert and the land of Canaan, but at Tanis, where Ramses ruled, and where Ménéphthah drove them to desperation. To the support of his theory, says M. Mariette, who has given his adherence to the conclusions of Herr Brugsch, the author brings arguments "short and few, but irresistibly solid." It explains all difficulties hitherto experienced, and takes away every stumbling-block.

THE new *Quarterly Statement* of the Palestine Exploration Fund contains valuable reports by Lieut. Conder, Mr. Tyrwhitt Drake, and M. Clermont-Ganneau. The progress of the survey continues to be most satisfactory. Lieut. Conder reports that the Jerusalem sheet, containing over 1,400 names, has been completely filled in, and that he has increased the number of special surveys to sixty-three, including that of Tell Gezer, the plan of the tombs of the Maccabees, the great church at Ramleh, &c. He has also confirmed the identification of Gilgal, first proposed by a German traveller, with Jiljul, or Jiljilia, a mile and one-third from Er Riha, though he candidly admits that "like many other of the sites which date from so remote an antiquity, in a country subject to continual inroads and devastation, there must naturally be a certain amount of doubt or difficulty attached to its identification." Mr. Tyrwhitt Drake's reports run to some extent parallel with those of Lieut. Conder. His researches on the boundary line of Judah appear to throw much light on the account in the Book of Joshua. The letters of M. Clermont-Ganneau relate chiefly to the archaeology of Jerusalem. He also gives two or three curious Arab legends, particularly one which bears a remarkable resemblance to the story of the fall of Jericho. Lieut. Conder also sends a note on the "Identification of Scopus from a Military Point of view."

MEETINGS OF SOCIETIES.

ROYAL GEOGRAPHICAL SOCIETY (Monday, April 27).

SIR BARTLE FRERE being in the Chair, portions of the letters written by the late Dr. Livingstone, and recently brought home, were read. The President said that Mr. Livingstone had undertaken the duty of constructing a connected narrative of the later years of his father's life from such material as they had now before them, supplemented by such oral information as they could derive from Jacob Wainwright.

The first letter read was dated October, 1869, in the Manyema country, and in it the Doctor reiterated his opinion, in spite of native accounts which informed him that the Lualaba flowed west after issuing from its last lake, that it must flow north-east and join the Nile basin. This would make the Lualaba and Tanganyika the two great head branches which Ptolemy speaks of. In another letter he speaks of the Tanganyika by Ujiji and "the lower Tanganyika discovered by Baker" as forming one continuous riverine lake whose northward flow (which he watched for three months during his illness) was marked by aquatic vegetation. The Lualaba was also a lacustrine river, from 4,000 to 8,000 yards wide. In 1873 he wrote to Sir Henry Rawlinson expressing his gratitude for his despatching the Search and Relief Expedition to his aid. But the goods sent to the depot at Ujiji for him were stolen, none of his maps or papers, except one letter, secreted on the person of a buffalo driver, reached him, and in despair he was on the point of working down to Baker for help, when Stanley providentially came to his aid.

* By an error of the printer, only half this note was printed last week.

SOCIETY OF ANTIQUARIES (Thursday, April 30).

MR. NEWTON ON THE DISCOVERIES AT HISSARLIK.

BEFORE the lecture a letter was read from Mr. Gladstone, expressing his regret that absence from town prevented his being present at the meeting. Mr. Newton commenced his address by stating that his object in bringing this subject before the society was not to discuss the question, whether Hissarlik was at Troy, how far Homer could be taken as an historical authority, or how near to the reputed date of the taking of Troy the poet lived. These were all questions of very great importance in reference to Dr. Schliemann's discoveries, but it would be better to keep them quite distinct from the enquiry which had now to be discussed, viz., to what period can the Hissarlik antiquities be ascribed on archaeological evidence? These antiquities, photographs of which, from Dr. Schliemann's work, were exhibited, might be roughly classed as pottery, the terra-cotta disks called by some spindle whorls, implements and weapons in stone and bronze, ornaments and vases in gold and silver. Taking the pottery first, the lecturer stated that it was clumsy in form, heavy in fabric, and in many examples had the surface polished by the hand and ornamented with incised patterns. In these peculiarities it resembled the ancient Latian pottery, found under the lava at Marino near Albano, and described by Sir J. Lubbock in the *Archæologia* in 1869; the pottery found under the lava at Santorin, described in the French *Archives des Missions*; certain specimens from Cyprus, discovered by Mr. Lang and General Cesnola, and certain specimens from Germany in the British Museum. Thus the Hissarlik pottery resembled that from sites which severally had claim to be considered of very remote antiquity. On the other hand, no trace of painted pottery had been found at Hissarlik. The lecturer then described the two classes of painted pottery which up to this time had been considered the most ancient obtained from Greek sites. The earliest of these was the pottery with geometrical ornaments painted in brown and black on a drab ground, with occasionally animals and human figures very rudely drawn. This pottery was found at Mycenæ, Tiryns, Athens, Melos, Ialysus, Camirus, Cyprus, in the tumuli near Sardis, in Palestine, and in the excavations at Nimrud. As it occasionally bore Phœnician inscriptions, and was found in purely Semitic localities, it might be called the pottery of the Graeco-Phœnician period. The pottery which succeeded to this, and of which there is a very fine collection in the British Museum, is sometimes called Corinthian. It is characterised by zones of animals painted in black, brown, and crimson on a drab ground, with incised lines to strengthen the outlines and inner markings; in the field are flowers. The human figure, and occasionally Greek inscriptions occur on these vases. The change of style in the designs is certainly due to Asiatic influence, derived probably from Assyria through the Phœnicians. These vases are associated in the tombs of Camirus with variegated glass, Egyptian porcelain, the imitation of Egyptian objects, and figures in bronze and terra-cotta. They probably range in date from 500 B.C. to 600, or even earlier. The more ancient painted pottery, that, namely, of the Graeco-Phœnician, may be ascribed to a still earlier date, and to this earlier period may also be ascribed certain marble statuettes found in the Greek islands, and certain gems engraved in intaglio, specimens of both of which were exhibited. Both the statuettes and the gems are singularly rude, but still their rudeness is very far in advance of the attempts to represent the human form in the Hissarlik antiquities. The lecturer then considered the curious terra-cotta disks, called by some spindle whorls, of which Dr. Schliemann had found such quantities. He suggested that they may have been strung and worn as chaplets, necklaces, and arm-

lets, as the Assyrians on the Nimrud friezes are represented wearing necklaces of cylinders and pierced gems. The Hissarlik disks may have been worn as amulets, and on that supposition the strange graffiti on them may have some symbolical import.

On a comparison of the pottery and disks from Hissarlik with the pottery and other antiquities of the very earliest period which we can connect with the Hellenic race, we find that the rudeness of Dr. Schliemann's antiquities far transcends the rudeness of all previously-known archaic art. Are we then justified in assuming that, because the Hissarlik antiquities are ruder, therefore they are earlier; that because their rudeness is non-Hellenic, therefore it is pre-Hellenic? That is the question really at issue in regard to Dr. Schliemann's discoveries. Of course there may be barbarism of all times. Certain British and Gaulish gold coins are of extreme rudeness, but it is now proved that they are of a comparatively recent date, being derived by slow degradation from the coins of Philip II. of Macedon.

Assuming, then, that art may be Neo-barbaric, or Palæo-barbaric, have we any certain criterion to distinguish these two classes? As yet not; we must consider each case with all its collateral circumstances; and taking all these into consideration, the lecturer thought we were justified in claiming for the Hissarlik antiquities a place in the pre-Hellenic period.

He then passed on to review the remainder of the collection. The implements and weapons in stone and bronze he left to be discussed by those more conversant with that class of antiquities. With regard to the gold ornaments, the lecturer remarked that they did not in any way remind him of the earliest ornaments of the Greeks, Etruscans, or Assyrians. There was no embossed or chased work, and only one slight indication of the granulated work of which Etruria and Camirus had yielded such fine specimens. The ornaments at Hissarlik were composed of wire and thin plates beat out, and had a curious resemblance to certain ornaments in bronze found at Hallstadt, in Upper Austria, and published by Von Sacken. In conclusion, the lecturer expressed his strong conviction that, for the due investigation of the Hissarlik question, the following ancient sites should be explored, the tumuli on the plain of Troy, the tumuli of the Lydian kings near Sardis, also Orchomenos, Tiryns, and Mycenæ, which latter site Dr. Schliemann was now at work on.

Professor Max Müller took objection to Mr. Newton's use of the term pre-Hellenic, contending that there could be no reason for supposing that the Greeks did not, like other nations, pass through such a rude phase of art as was represented by the Hissarlik antiquities. The word pre-Hellenic is, however, employed by archaeologists simply to indicate the period of Greek civilization preceding that in which the name of Hellenes came to be applied to the whole nation. Another point raised by Professor Müller was Dr. Schliemann's interpretation of the word "glaukopis" as meaning "owl-headed," which Mr. Newton had partly defended, though the terminations *ops* and *opis* clearly refer to the eye only, and not to the head. The fault of Dr. Schliemann's interpretation of the *Iliad* generally is its literalness; and, after complaining of this, Professor Müller referred Dr. Schliemann to the passage in the *Iliad* where Hector laments that there is no more gold in Troy, as itself proof, if taken literally, that the treasure found at Hissarlik was not a Trojan treasure.

Mr. Bunbury, in reference to a remark in the letter from Mr. Gladstone, justified the statement as to the presence of tin in the Hissarlik bronzes, which had been made in a recent article in the *Edinburgh Review*, of which he avowed himself the author.

Mr. Franks pointed out that in France, Ireland, in India, and elsewhere in the East implements of pure copper certainly occur, though the instances are very rare. He also exhibited drawings of the

bronze implements found at Ialysus, which he considered much less rude than those from Hissarlik.

Mr. Octavius Morgan drew attention to the fact that copper is exceedingly difficult to smelt without a slight admixture of tin. Mr. Howorth noted the resemblance between the vases from Hissarlik with the so-called owls'-heads and certain vases found in Germany, and published in the *Zeitschrift für Ethnologie*.

ROYAL INSTITUTION (Friday, May 1).

PROFESSOR ROLLESTON began his lecture on "The Early Inhabitants of the North of England," by referring to the various objects, such as urns and their contents, ornaments, and other relics, procured from the graves of the various races who had successively inhabited the North of England. In the first part of his lecture he described the finding of a very large number of Anglo-Saxon cremation urns in that part of the East Riding of Yorkshire which is connected with the names of Edwin, Paullinus, and Coifi. The importance of this find was pointed out, none of similar magnitude having been as yet come upon in that district. And the general confirmation which it gave to the views previously advocated by the lecturer at the Royal Institution (see *Proceedings*, March 25, 1870), to the effect of the Anglo-Saxons having been exceedingly numerous, was pointed out. In the second place, he exhibited and described some sets of ornaments procured by him in the same district from some Saxon burials in the stage between heathen cremation and Christian burial, as described by him in the *Archæologia*, vol. xlii., 1870. With these relics certain much older, as well as certain quite modern implements had come to be mixed up in the graves themselves, and the various fallacies which accidental or intentional intermixtures might lead, or had led to, were glanced at. Thirdly, the lecturer, in a very few words, gave a summary of the way in which cremation, supreme in England during the period of Saxon heathendom, from A.D. 450 to A.D. 630, had given way in at least the more civilised parts of Roman Britain to burial, from the date of the generation subsequent to Septimius Severus down to the former of the dates just given.

Before passing to the description of the pre-Roman and pre-historic modes of interment practised in the North of England, the lecturer made some remarks as to the *rationalis*, or, as it might be termed, the genesis of the practice of cremation, referring herein with an expression of mingled assent and dissent to the recently published views of Professor Unger, in the *Mittheilungen aus dem Götting'schen Anthropologischen Vereine*, 1874, p. 25 seqq., and to the account of the "Funeral Ceremonies of the Ancient Hindus," given by Babu Rajendralala Mitra in the *Journal of the Asiatic Society*, No. iv. 1870. Affection for a deceased relative suggested two objects to survivors in all ages: firstly, the preservation of the surroundings of the deceased in the very condition in which they were at the time of death, this object being felt to be a right one, as the mourner did not realise the fact of death in all its bearings at once. Secondly, when the fact had impressed itself and become realised, it was felt to be right to have the remains of the departed preserved under the protection and in the proximity of kinsfolk. The chambered long barrow, with its inmates ranged in a crouching position along its wall, with food and other outittings placed side by side with them, in imitation of the house, or cave, or hut tenanted by them in life, answered both objects; difficulties of transport, death in war, or plague, or the natural working of warmth of climate, as described by Teiresias in the *Antigone* of Sophocles, 1060 (1080), made cremation often the only possible mode of securing, at least, the second of the two objects. Professor Rolleston concluded by giving a description of the round and long barrows of the North of England, at the examination of which by the Rev. William Greenwell, F.S.A., he had many times assisted.

FINE ART.

THE MASTER OF ANTONIO ALLEGRI.

Notizie di Antonio Allegri, di Antonio Bartolotti suo Maestro, e di altri Pittori ed Artisti Correggiesi. Dell' Avvocato Cav. Quirino Bigi. (Modena, 1873.) 8vo.

It is less curious than disheartening that "Correggio literature" should have swelled to its present inordinate size without adding a tittle of evidence to that which was brought together half a century ago by Pungileoni.* There is clearly a demand for such literature, since Martini's *Life of Correggio* went through a second edition in 1871 at Parma, and was followed in 1873 by a new book, the title of which heads this notice; but we may regret that the supply should be so copious, since it is at the same time so worthless.

Cavalier Quirino Bigi is a member of the Royal deputation appointed to promote the study of Italian history in the provinces of the Emilia. He is a corresponding member of numerous scientific and literary academies, but he seems to have no taste for the rules which should guide historians, and still less respect for the strict method which imposes on them a due reference to authoritative sources. In a diffuse yet dogmatical style he makes statements of the most extensive scope without attempting to support them by documentary evidence; and he constructs a *Life of Correggio* in which a well-worn narrative is covered with new patches as an old coat might be with large but worthless spangles. There is nothing more evident than that Antonio Allegri received some sort of education in the city of his birth. Equally certain is the influence of the Venetian and Mantuan schools upon the development of his art. Yet if we are asked to name the master who trained him at Correggio, we are quite as incompetent to give an answer as to say with certainty that he had acquaintance with Costa and Leonbruno on the one hand, or Palma and Lotto on the other. Looking at the pictures which have been preserved, we may infer that he had some connexion with all these painters, yet no one can do more than urge the probability of their having met. But such scruples as these Cavalier Bigi ignores. He speaks of Antonio Bartolotti as Allegri's master without adducing any testimony, just as he affirms, without condescending to vouchers, that Allegri accompanied Manfred of Correggio to Mantua in 1511. Similar statements have been made in the shape of suggestions, never before in the assumed form of established facts.

It may be conceded that some light has been thrown by this book on the life of Bartolotti, though even here manuscript records are quoted of which the text is altogether withheld. In substance the story is this: Bartolotti's name appears at the head of the register of the Guild of Correggio in 1500; it occurs in connexion with works of art in the books of the Franciscans, and in the records of

* Pungileoni's materials were those which Michele Antonioli of Correggio put together. They were used, as we learn from Campori (*Lettere*, p. 263), after Antonioli's death without acknowledgment.

the Palace of Correggio; there is documentary proof to show that Antonio and Ladino with two apprentices from Correggio laboured in the Castello of Novellara, and that payments of money for the board and lodging of these artists are in the accounts of that palace for 1514—1518. Interlaced with statements of this kind are more dubious ones as to pictures assignable to Bartolotti, and amongst others one which refers more particularly to an altarpiece in the gallery of Modena representing the Virgin and Child between St. Francis and St. Quirinus. The story told of this piece deserves notice, as it illustrates the method upon which Cavalier Bigi thinks fit to proceed. He says truly, that in the background of the picture a *cartello* may be observed, containing a line of capital letters and the date of 1511; but he performs a curious feat by giving us the sequence of these letters as A B D N D F, and interpreting them: "Antonius Bartolotti De Nostra Devotione Facta." Nothing more easy after this than to assign any number of works to the same person. It may be a matter of small account that such sleight of hand should be displayed in respect of a painter of low powers like Bartolotti; but when the same system is applied to Allegri, the consequences are serious.

In the further course of his narrative, the author alludes to certain decorations made by Bartolotti in the suburban palace of the Lords of Correggio; and he says "that it is affirmed that two of the rooms in the same palace were painted by Bartolotti's pupil Antonio Allegri." Who affirms this, and upon whose authority, Cavalier Bigi does not deign to inquire. It is sufficient that some one has once made the statement. He believes and accepts it, and, starting from these premisses, he goes back to the records proving the employment of Bartolotti with two apprentices in 1514—1518 at Novellara, to declare that one of these apprentices must be Antonio Allegri. If the altarpiece of San Francesco at Dresden be accepted as a genuine work of Correggio, and as one which he finished in 1515, we shall know what to think of a theory which makes a master of such power subordinate to a nameless local guildsman. But if we remember that the *Marriage of St. Catherine* at the Louvre was finished about 1518, we are left to form a very poor idea of Cavalier Bigi's discretion.

To follow this historian through the dull and uninteresting life of Pomponio Allegri, who inherited the name without a particle of the talents of his father,—to read how Antonio Bernieri, after being taught by Allegri, went to Venice, "and there obtained from Titian the lessons which enabled him to become a perfect miniature painter,"—to trace the wake of the narrative as it meanders through the lives of obscure Correggians is a task so tedious that few will venture to undertake it. Future searchers may turn the pages for a stray notice. They will be able to consult what Mr. Carlyle so often and so pathetically regrets not to have found—an index—but they will be careful not to accept Cavalier Bigi's facts unless they are confirmed by other evidence.

J. A. CROWE.

THE MOABITE POTTERY OF M. SHAPIRA.

UNDER the title of "Chauvinism in Archaeology" Professor Schlottmann communicates to the *Nord-deutsche Allgemeine Zeitung* of April 12, the following letter respecting the imputations recently cast upon the genuineness of this collection by M. Clermont Ganneau.

Halle: March 31, 1874.

"In the year 1872 a collection of numerous objects in clay, some of which bore letters and inscriptions, was brought to Jerusalem from the Moabite territory. There were among them urns, pendant lamps presenting more or less elegance of form, and many strange-looking idols, besides numerous tesserae, and other smaller objects, such as we commonly meet with in remains belonging to Roman and Greek art. Drawings were sent to me of the articles in question, by which I was enabled to give the earliest report that had as yet appeared of these discoveries. I attempted also a variety of explanations in which other scholars concurred. In consequence of the representations which I was empowered to make to the Government at Berlin, on the part of the German Oriental Society, as their secretary *pro tem.*, the whole of the Moabite remains were purchased in the autumn of 1873, after having been submitted to various careful examinations with a view of testing their genuineness.

"This collection has, however, been denounced as spurious by M. Ganneau, lately in the service of the French Consulate at Jerusalem, and at present an agent of the Palestine Exploration Fund, although he has not seen the objects which he condemns as the work of a forger. In a letter which appeared in the *Athenaeum* of January 24 of last year, M. Ganneau had made known his views on the subject in a manner which was well calculated to impress all who were ignorant of the real bearings of the question, and his remarks were copied into various foreign papers.

"M. Ganneau's communication to the *Athenaeum* called forth no small amount of reprobation on the part of some of our best Oriental scholars, one of whom in a letter to me expressed his regret that 'Chauvinism should not have spared even the Moabite antiquities.' In a similar strain, the American Professor MacWhorter, an independent competent authority, in writing to the *New Haven Daily Palladium* (February 19), compared M. Ganneau to those pieces so often represented on the Paris boards, in which French soldiers are always giving chase to the Germans—for no other object, as far as one can see, than that of gratifying the taste of a certain portion of the audience. Professor MacWhorter recommends his countrymen to suspend their judgment for a time in order that—to compare small things with great—they may have an opportunity of seeing M. Ganneau hastening on to his 'literary Sedan' as the inevitable sequel to his self-imposed 'baptism of fire.' And it must be confessed that he has thrown himself headlong into one of the most absurd delusions, while he fancied he was triumphantly exposing the snares into which others had fallen.

"I have from the first drawn attention to the various particulars in regard to which the Moabite inscriptions might be considered open to suspicion, while I at the same time pointed out the different marks of genuineness which as undeniably characterise them; and on all these points I have had the satisfaction of knowing that my opinions agreed with those of the most eminent scholars. I think, moreover, that in several respects the inscriptions present a degree of technical and artistic skill in their execution which entirely precludes the idea that they could be the workmanship of an unskilled mechanic of Jerusalem, or of any forger. Thus, for instance, we find that the raised letters have been executed in very different styles, as on one of the urns now in the Berlin Museum, where the characters have undoubtedly been formed by the application of

stamps or types, presenting the earliest evidence of that mode of multiplying writing which was subsequently developed into the art of printing.

"The internal evidences of authenticity are quite as conclusive as these external features, which M. Ganneau refuses to recognise. The source from which the collection was obtained, is, moreover, perfectly unimpeachable, as the objects of which it is composed were purchased from the well-known German bookseller and antiquary, Herr Shapira, who is justly held in such high esteem by his compatriots at Jerusalem, that, as M. Ganneau himself expressly admits, his character is unimpeachable. It is admitted that he exercised great skill and circumspection in collecting these Moabite antiquities; for, after having secured the good-will of the powerful Trans-Jordan Sheikh, Ali-Diab, whom he entertained hospitably in his own house, he had sent an experienced agent, Selim-el-Kari, into the desert, who pressed the Bedouins with unexampled success into the service of science.

"But it is precisely at this point, according to the hazardous conjecture of M. Ganneau, that we are enabled to detect the first trace of deception; and here our French opponent, basing his assertion on a far inferior knowledge of the country and the people, does not hesitate to charge Selim with having duped Herr Shapira, thus crediting the man with the extraordinary talent of being able suddenly to show himself in the character of a skilled artificer and moulder of clay figures, which he moreover must have had the cleverness to transport, undetected, from Jerusalem to the other side of the Jordan, and to bury for the purpose of excavating them again. Yet this was a man who could at best daub a rude picture for the use of the pilgrims. We may also mention that, for the satisfaction of doubts which had been raised as early as August, 1872, the scene of the Moabite discoveries was visited, and carefully examined, by Messrs. Weser and Duisburg, the latter of whom is a practical business man, well acquainted with the country, and thoroughly conversant with people and things in the East. Under circumstances which positively admit of no ground for deception, these gentlemen obtained a variety of inscribed objects in terra-cotta, which are precisely of the same character and appearance as those which had already been brought to Jerusalem. Drawings of these articles are before me, together with Herr Weser's interesting journal, which has been printed. In the course of a second excursion he obtained seven urns, which he saw removed from the earth; and when he and Herr Duisburg, together with three English travellers, made a third expedition to the same spot at the end of February of the present year, numerous collections of clay figures were offered them for sale by the Bedouins, who since, having found a purchaser for them in Selim, had been constantly on the alert to make further discoveries. Considering all these circumstances, we can scarcely attach any permanent weight to the romantic theory of M. Ganneau, in whose eyes this unseen Selim plays the part of a veritable magician out of the *Arabian Nights*.

"But in these flights of fancy M. Ganneau is not even original. In all he says he is simply distorting and exaggerating the equally groundless, but still more thoughtfully considered objections of Mr. Tyrwhitt Drake, who, in his letter in the *Athenaeum* of March 7, 1874, drew attention to the slender grounds upon which M. Ganneau had been disposed summarily to deny the genuineness of all Moabite remains of clay and terra-cotta articles. Mr. Drake, however, went no further than to declare, that while he believed the first discovery to have been genuine, he considered that the objects then found had been copied, and the spurious imitations passed off as original. It cannot, however, be denied that, apart from ordinary grounds for suspicion, Mr. Drake has no foundation for these opinions beyond the statement of a ragged old potter's assistant, a genuine vega-

bond, called Abd-el-Baki, who stated, after a prolonged examination, that he had been employed by Selim to make the clay figures in question. The man, however, subsequently contradicted this on oath, and declared at the German Consulate, that, when he made his previous statement, the strangers had 'stolen his tongue,' meaning thereby that he had been led to say what he saw they wished to hear—a well-known characteristic of a certain class of Arabs; and the best proof of his not having lied on the second occasion is his want of practical skill as a potter or moulder when put to the test, for the two earthenware figures which he made for Mr. Drake in return for a very large sum of money show no resemblance whatever to the design, or to the drawings of the undoubted Moabite idols.

"Mr. Drake, who very reasonably felt some doubt in regard to the disclosures made to him by Abd-el-Baki, on December 24, 1873, was desirous of obtaining further proof. He accordingly communicated his suspicions to M. Ganneau, and begged him to receive them in 'confidence.' But M. Ganneau, inspired by a desire to derive *éclat* by publishing a piquant revelation, wrote on December 29 the letter which subsequently appeared in the pages of the *Athenaeum*. In the interval between Mr. Drake's letter and the date of M. Ganneau's writing, the latter had, after many ineffectual attempts, succeeded in procuring one witness—a poor, shy, feeble, one-eyed boy, called Hassan, to corroborate his statement that all the Moabite pottery was a colossal piece of humbug, disgraceful to the German *savants* connected with it. This boy, who had been apprenticed to a potter, confided to him, in the strictest secrecy, that Selim himself made all sorts of inscribed clay figures, which were baked in his former master Ahmed's furnace, and that he had frequently carried them backwards and forwards. The man, Ahmed, when brought up to the German Consulate, declared that the boy's story was a tissue of lies from beginning to end; and although the lad himself, with much crying and many contradictions, at first kept to his accusation against Selim, he after a time retracted his words, and with renewed tears confessed that he had lied out of fear for 'the man on the white horse,' i.e. M. Ganneau. According to his statement, he had been induced by the orders of his present master (a man from whom, by the way, M. Ganneau had been unable to obtain any information) to follow the gentleman to his distant residence, and there, within closed doors, and after receiving a box on the ear and seeing the riding-whip laid down ready for use, he said what he knew it was wished he should say. We are bound, of course, to refer much of this account to the imagination of the Arab boy; but, on the other hand, we may, with equal certainty, assume that his first statement was decidedly not *spontaneous*.

"The report, which will shortly be published, of the investigation which took place at the German Consulate will, we are sure, prove beyond doubt the perfect untrustworthiness of both these witnesses. We can easily understand how they became possessed of the information necessary for their purpose. The large sum of money paid by the Prussian Government for old and apparently unimportant articles of pottery had probably been exaggerated among the Arabs by report, while the good fortune that had befallen Selim must have been well known among them, and more especially to the handful of potters of Jerusalem. Nor can we suppose that these men were so stupid as not clearly to perceive the object of the two sceptical foreigners, who made repeated search for the supposed manufacturers of these articles.

"We think that Selim's undoubted cleverness is a fresh proof of his honesty, for why should he have engaged in the dangerous and precarious labour of fabricating spurious antiquities, when his many years' acquaintance with the Bedouins must have made him familiar with the abundance of earthenware figures and other objects which

they found in the land of Moab? There is not a shadow of foundation for the assumption that he ever undertook any such labour. On the very day when the number of the *Athenaeum* incriminating him reached Jerusalem, a domiciliary visit was made at his house while he was absent in Moab, but neither drawings, models, or instruments of any kind which could incriminate him were found on the premises. On his return he was taken to the German Consulate before he had crossed the threshold of his own door, and remained there by his own consent, under constant surveillance, for several days. It was impossible for him to have entered into any understanding with the two witnesses, and when they were confronted with him it was discovered that they did not even know him personally. In his examination, at which M. Ganneau and Mr. Drake were present, there was nothing in his behaviour or manner to imply guilt. He certainly charged M. Ganneau with having promised him 100*l.* if he would confess that he had fabricated the clay figures in the possession of Herr Shapira; and in reply to this, M. Ganneau observes that he considers this statement as equivalent to a confession of Selim's guilt (*Habemus reum confitentem*!), or else as a proof that he himself had been guilty of the meanness ascribed to him. There can, however, be no doubt that he had closely questioned Selim with a view of extorting the wished-for admission; and one can easily understand that the excitable Arab, if he were innocent, should have paid back a false charge now publicly made by an equally false counter-accusation.

"The illogical alternatives by which M. Ganneau has thus made Mr. Drake's unproved, but yet conceivable theory appear at once inconceivable and contradictory, only show the difficulties of his position. He believes that Selim fabricated the new Moabite inscriptions according to the copy of the Mesa inscription that was made some years ago. But the recently found inscriptions are composed of letters belonging to several other alphabets besides the Moabite. The forms and symbolism of the clay figures, if false, also imply extensive archaeological knowledge, and therefore we must enquire who could have been the learned epigraphist and archaeologist who stood at the elbow of the ignorant and unlettered Selim. In reply to this and similar inquiries, and to the observations made by Herr Weser in reference to instances of falsification, M. Ganneau, in the presence of Mr. Drake and others, retreated, on Feb. 16, to the more modest position of doubting only such articles in the collection as bore the same letters as the Mesa Stone! The next day, however, he penned another letter to the *Athenaeum*, in which he reiterated his former assertion, that the *entire* collection was spurious, concluding his remarks with the pathetic sentiment, 'Either I myself am an "illustrious impostor," or the pseudo-Moabitic pottery must once for all be banished from the domain of science, to which it never ought to have been admitted!' If this alternative be correct, we on our side must repeat, *Habemus reum confitentem*! However, we are quite ready to suggest a third alternative in the self-deception of over-hasty zeal and ill-regulated patriotism.

"M. Ganneau has, upon a previous occasion, publicly laid himself open to these charges, for in 1870 he did not scruple to proclaim himself the first discoverer of the since celebrated Mesa Stone, although the credit of the discovery really belonged to the German missionary, Herr Klein. He, moreover, took occasion, when negotiations had been set on foot by the Prussian Government for the purchase of the stone, to interfere in a manner not very creditable to himself, the deplorable result of which was that the tablet was broken up by the Bedouins. English scholars expressed their opinion of his conduct in no measured terms, and at the time I myself defended him in an English periodical against several unproved charges, as I was disposed to judge him as

leniently as possible in consideration of the really good service which he had done to science. Now, however, he has forced me by his ill-considered observations—enveloped as they are with a semblance of official accuracy—to draw attention to the less bright aspects of his conduct; and in the interests of truth and of the genuine value of a collection which our own Government has with praiseworthy munificence secured to science, I am compelled to speak of M. Ganneau with uncompromising plainness and candour.

"I need hardly observe that I have no intention in what I have said to charge the Oriental scholars of France generally with Chauvinism. Among them are men whom I highly honour, and from whom, I feel confident, I may look for an unprejudiced opinion even in regard to the present question; and no one would rejoice more than myself should M. Ganneau be disposed to retract his over-hasty judgment, and thus pay to science a service to which his considerable abilities would impart a genuine value.

"PROFESSOR DR. SCHLOTTMANN."

EXHIBITION OF THE ROYAL ACADEMY.

First Notice.

THREE stages of impression are naturally excited by these many-coloured walls in the mind of the spectator who year by year surveys them. The first impression is all beauty and brilliancy; we feel as if in the poet's Palace of Art; we do not know how we can ever discriminate between so many rival masterpieces. It would be a very wonderful gallery indeed, and such as the world at present nowhere contains, not even, probably, within the walls of any single cabinet, which could sustain this childlike and delightful illusion; and the next stage which the critical spectator reaches, by a natural reaction, is hence often a sense of flatness, general level of commonplace, and disappointment. But, as the first impression disappears from all except children spontaneously, so the second disappears from all but a few minds of more than common narrowness and cynicism. Studying the walls more carefully, we reach the third, finding now much to admire, with little shown which does not bear evidence of strenuous human effort, even if this be not always, or very often, successful. We now begin really to see the Exhibition; we can now try to decide upon what we like; we may now, with a little trouble, gain that highest pleasure which lies equally far from undiscerning praise and narrow satire, and is found in the fairest and most painstaking judgment we can form upon the many things submitted for our enjoyment.

Some visitors to the Exhibition will turn, with something of a sneer, from the last words. Art is for pleasure only, they will murmur; they do not care to frame a judgment upon it, especially if pains are to be taken; they mean to follow their tastes, "about which no dispute is permissible;" fairness on these matters is unattainable, and not worth having, if it were to be attained.

Voices such as these are common in private utterance; nay, they have been sometimes heard as public professions from those who, unhappily, have had the power to put their "educated barbarism" into overt practice. The most immediately impressive argument against those who think thus is, that spectators in this frame of mind sacrifice much of their immediate, and more of their permanent pleasure. It is wonderful how greatly enjoyment is increased when we feel that it depends upon the exercise of our own sense and judgment; when we are not mere passive recipients, but can account to ourselves and to others for what we have received. The difference is like that between looking indolently on a landscape or a cathedral, and making out the several features of the scene, identifying the chief objects, or following the dates of the building and the purposes of its structure. The little immediate

exertion is followed by an almost disproportionate enlargement of pleasure. And we should observe that it is only this reasoned pleasure which remains in the memory, and forms, in its turn, a foundation for greater enjoyment when we see the next sight, or the next gallery. For, although the object of art is really and only pleasure, and any other aim, however high, substituted for this, a divergence from the proper object, yet it is in a lofty and enduring pleasure that the object is truly attained. Treat Art as a simple pastime, and, by a singular natural law, the intellectual element in it, which cannot be eluded or eliminated, soon makes it wearisome.

If these remarks carry any conviction with them, it will probably be next urged by many, that more knowledge is required than they have to bring; that taste is too difficult for them, even whilst they allow it to be desirable. To such objectors our answer would be simply, Try! Taste in art is, we would not venture to say a much easier, but certainly a much simpler thing than is often imagined. True it may be that, in its purest and most finished sense, taste requires a considerable and varied knowledge, including experience to compare what has been done heretofore within the sphere of the art in question, resting on a natural bias or capacity of due sensitiveness. But a certain degree of taste may be gained with a far smaller range of these gifts and acquisitions, which will put us in the way of judging wisely, and help us to understand the judgments of more instructed men. As much as this, at any rate, lies within the scope of hundreds, who, simply from not caring or not daring to begin, forfeit the pleasure which even the earliest efforts to judge reasonably would yield them. And if opportunity or native capacity for long advances be denied, this ought no more to be accepted as a ground for not attempting, than a girl would be justified who gave up music because she will never play like Madame Schumann. "It is something to go so far, if to go farther be not permitted."

If the notes on this year's Exhibition which I propose to give, aid any spectators to a more complete enjoyment, whether by way of agreement or of dissent from my criticism, my purpose will be answered. The invidious task of attempting to review the work of contemporary artists requires some such possibility of usefulness to render it endurable; and the writer faintly hopes that, in cases where he is reluctantly unable *omnia bona dicere*, this aim may be accepted as some palliation of his criticism. I shall, however, only try now to mark out the pictures which appear, on different grounds, most noteworthy, at a first glance over the many-coloured walls of the 106th Exhibition.

Perhaps the most convenient scheme will be mainly to follow the natural order of the rooms; reserving an arrangement by subject and style for subsequent notices.

In the first gallery Mr. Hook gives us the *Kelp-Burners*; one of the most brilliant of his scenes from Shetland, a district which supplies exactly that quality of shoreside rock and picturesque fishing population which has long enjoyed his special favour. This very bright and pleasing picture has a companion, we suppose from the same region. Mr. Millais, who appears, as he has often done during late years, in the triple form of portraiture, figure subject, and landscape, matches Mr. Hook on the opposite wall with a pine forest and a load of timber carted away from a hillside. This hillside is one of the most successful bits of landscape in the Exhibition.

We can here only note in passing M. Legros' French tinker as one of the ablest pictures of the year; with some pleasant figure-pieces by Messrs. Perugini, Prinsep, and Storey. Here, also, is a portrait by Mr. Watts of the justly distinguished preacher and thinker, Mr. James Martineau. This, like the same painter's head of Mr. John Stuart Mill, elsewhere, is very striking; though, perhaps, in both portraits the attempt to paint the look of

mental power is conspicuous above the power to render it.

In the next room Mr. Stone has a group of a labourer and his family, on a larger scale and with a greater simplicity of intention than is common with his work. Two good specimens of the rock and sea landscape, executed in that definite style of handling which marks one school of our landscapists, by Mr. Knight and Mr. Naish, are here, with a large sea-piece by Mr. Brett; and there are several small figure pictures by the familiar names of Marks, Tissot, Leslie, Pettie, and Calderon, to which we shall return. But we ask special attention to the *Moorish Garden* (Mr. Leighton) and the *Children teasing a Snail* (M. Frère), as two works of great though widely diverse beauty, and both (in our eyes), by far the best specimens which the artists respectively exhibit. There is also a Roman picture-gallery, in which M. Alma-Tadema divides our interest between archaeology and sentiment, and a carefully-finished child-portrait by Mr. Millais; which, however, hardly has that interest which his work generally commands.

The great gallery, perhaps, fails to retain its comparative superiority upon this occasion. More than anywhere, I think we here miss Landseer. Our most brilliant, if not our soundest, figure-painter holds one of the "places of honour." The *North West Passage* (an aged sailor declaring for a new voyage of Arctic discovery) is, no doubt, destined to be the leading popular star of the year; but, with too many more of Mr. Millais' splendid audacities, in years far off is likely to excite an admiration freely tempered by the first of the two famous criticisms which Goldsmith enforces on his youthful connoisseur. The place of honour opposite is occupied, if not filled, by a work which even Mr. Frith's numerous admirers are not likely to find quite adequate to the situation; an ecclesiastical ceremony at Boulogne. Near the first door we have Mr. Marks' elaborate *Builders' Strike in the Sixteenth Century*; but we fancy that he is more favourably represented further on. Opposite to this hangs the best piece of serious figure painting we have hitherto met with; the *Virgin taken Home by St. John* of Mr. Armitage. Passing several landscapes of merit, amongst which an inland view by Mr. Hook shines conspicuously, we note an animal picture by Mr. Rivière, larger than any we have seen by him, larger, indeed than he has been able to deal with satisfactorily; a pretty Florentine subject (Mr. Yeames), and a very clever Moorish scene by Mr. Hodgson. Here also are two Oriental interiors by Messrs. Leighton and Lewis. The latter has another in the fourth gallery, not more perfect technically than this *Bazaar*,—for that could hardly be,—but with much higher charm and interest: it is one of the great successes of the year. A capital small piece by Mr. Marks follows; a solitary reader enjoying the fun of Rabelais; and, in another style, Mr. Dobson's pretty girl with goats. And Mr. Herbert's excellent (and, to our eyes, much improved) repetition of his subject from the parable of the "Sower," again suggests the same kind of contrast with Mr. Poole's eminently sweet and graceful *Rest by the Wayside*.

Passing much, here and indeed everywhere, for more careful review, let us note a clever incident-piece from Morocco by Mr. Burgess as a welcome relief from too many "things of Spain;" a child by Mr. Millais, rather lively than lovely; and a remarkably pleasing and interesting scene from Covent Garden Market (Mr. A. McLean). But by far the most noteworthy work in the fourth gallery,—in some ways the most noteworthy we have as yet examined,—is the large canvas of *Applicants at a Casual Ward* (Mr. Fildes). With this work of remarkable skill and high, almost tragic, impressiveness let us also here name the two contributions by the great Dutch artist, Israels: a life-size girl, and the *Anxious Family* (galleries six and seven), commending them all heartily to the spectator's best attention.

In these rooms and in the tenth gallery hang the poetically-felt *Convent Boat* (A. Hughes); a lovely sunset landscape by Mr. Davis; two classical pictures (*Prometheus*, by Mr. W. Richmond; *Ulysses*, by Mr. Hardy) each able in its way, and the former (if on such a point we may express an opinion), a successful piece of more than life-size drawing; a fine Pyrenean view, with sheep in the foreground (A. Bonheur); the *Old Sailor's Museum* (A. Stocks), one of the best pictures exhibited in the "incident" class; a very originally-treated landscape, by Mr. Lloyd (*Sailors' Gardens*); and another of much power (*Boats in Harbour*), by Mr. Morris. The Lecture Room, filled with oil-pictures, many of mark and worth, the water-colours, architecture, crayon drawings, and prints, with that forlorn hope of our art, noble and unhappy sculpture, I here omit. But if the impression has been clearly given, it will have been perceived that, whatever be the spectator's final judgment on the character and prospects of English art as here exhibited, there is much to reward his attentive study.

F. T. PALGRAVE.

EIGHTH EXHIBITION OF THE SOCIETY OF FRENCH ARTISTS.

THE walls of an exhibition of cabinet pictures bear always a certain resemblance to the pages of an album. In both cases we look to find an amusing variety of work, rather than such quality as makes a serious demand upon our attention. Minor men may perhaps give us of their best, but if a great name appears, it is usually only to enter the momentary record of a passing mood. But whilst it would not be fair to base any general estimate of French art on the contents of an exhibition such as this, they afford us much additional and valuable material for study.

The first thing which strikes us here, as indeed it must obviously strike the observer wherever work of this school is gathered together, is, that up to a certain point all is so good and so complete. Turn where we will, we have before us unmistakable evidence of accurate observation of nature, of highly trained memory, of assured knowledge of ways and means, of clear sight, of definite purpose, and steady hands. Take the landscapes, which form so conspicuous a portion of the whole collection. Whether we look at the sheltered waters of Mathon's *On the Seine*, or dwell on the simple, pure, and tender tones of Boudier's *Pond at Rougemont*, or turn again, caught by the delicate sentiment with which Lambert has invested a *Duck Pond*, we find the same accomplished workmanship brilliantly equal to the task of reproduction. The *Wood Gatherers*, by Pelouse, is, in its way, fidelity itself, and Karl Daubigny gives us exactly what he chooses, whether it be *Washing on the Oise*, or *Moonlight*, or *St. Paul's from the Surrey side of the Thames*, or *Low Tide at Villerville*, enriched by an additional dash of manly vigour and energy which sends home to us the perfect truth of his work with the more emphatic meaning. The masterly performance of Fantin's flowers (the tone of the background in *Azaleas* is luminously beautiful) is equally conspicuous, and Dupré's *Boats at Sea* is admirably effective.

Then, in the figure subjects, Roybet's *Negress charming a Heron* is not only important on account of its size, but for the wonderful skill displayed in much of the painting, which is so absolutely real (we may note, for instance, the mother o'pearl in the tabouret, and the brush drawing in the plumage of the heron), and yet so perfectly in its place, and so full of apparent ease. On all sides it is portraiture, serene realism, satisfied in its end and the magic triumph of its means. Nowhere do we trace the disturbing effort after the unseen, which has troubled the true poet in all ages, and shortened so often the power of his hand. Shades of sentiment now and again are permitted to soften the harshness of uncompromising directness in the reproduction of

colour and form. But even this is rare. Jules Breton's *Peasant Woman of the Douarnes* is very perfect and complete in its way, and Corot continues to weave his mysterious webs of quivering tint; his *Goat herd, Evening* is full of true charm and delicate skill. Corot cannot, however, be counted of the band who represent the aims and tendencies of our day. The new men have revolted against authority, against the school of which they are the children, against the principles of careful design, and classic rule to which they have owed so much. Here and there these conditions result, as in Sisley's *Hill at Poissy* and *Street in Poissy*, in a voluntary renunciation of the usual sources of pleasure, a selection of nature which attracts neither by charm of colour, nor by mystery of chiaroscuro, nor by play of line. It is in the same spirit, though with widely differing artistic power, that Courbet, who reckons as a chief leader, attacks *Rocks at Ornans*, giving us back perfectly just relation of tones, with, as it were, the faithfulness and insensibility of a mirror; or Vollon renders *Tréport*, which is one of the finest achievements of the kind in the room, but which, like its companions, though the whole surface could be well taken in by the eye at a distance of two feet, is calculated to produce its effect only at about three yards off. Then, if as with Madrazo colour is the chief preoccupation, it is not sought for in the spirit of a colourist instinctively seeking for lovely harmonies, but rather in the spirit of an adventurer eager for the execution of *tours de force*, for the production of startling and unforeseen effects. And the training through which these men have evidently passed, enables them to encounter technical difficulties with the confidence justified of knowledge.

What will be the next turn taken—whether the movement has a living principle of growth which will issue in crowning success; or whether a speedy reaction will set in which will place French art more completely than ever under the yoke of tradition and authority—it seems at present impossible to predict.

E. F. S. PATTISON.

MR. STOREY'S SEMIRAMIS.

MR. STOREY is certainly inexhaustible. There is no artist who repeats himself less, and there is none who limits his range more severely. All the great statues by which he is known are seated women—large, solid, mature. He never makes them stand, or even lie; he is never tempted by manly or girlish beauty; yet no two of his statues are alike.

"Semiramis" is leaning with her left arm far back on the cushion of a low chair, her right hand with the signet-ring on it hangs in her lap; the right leg is thrown over the left; the body is thrown far back on the left arm, but the head is upright; the hair is bushy and curly, bare, and bound together a few inches from the head. She wears a loose dress of fine linen unfastened at the throat, with a sash round the waist; her bracelets and crown and sandal clasps are jewelled, and the polish of the marble at these isolated points makes a happy approach to illusion.

The face is powerful, worn, and troubled, with what might pass for the traces of guilt, and yet with a dominant sense of sullen, vigilant, imperial repose and voluptuous satisfaction. What masks the voluptuousness more than anything else are the eyelids, which are beginning to close over the full inscrutable eyes: the note of cruel scornful majesty is on the sharp edge of the curling upper lip.

The pose and the drapery are superb, and the softness with which it clings about the breast is delightful; the head is full of knowledge and power, and even nobility; but the nobility comes perhaps rather more from the embodiment of an intellectual theory, rather less from an intuition of prehistoric heroism than might be exactly to be

wished. It is also a question whether the texture of the flesh in the hands and feet is as perfect as the modelling; on the other hand, it seems as if realism had been carried too far in the full bushy eyebrows, which catch the light in a perplexing way, although in nature they would tell as dark by virtue of their natural colour.

The statue, which is the property of the executors of the late Mr. Benzon, is on view at Mr. Holloway's. G. A. SIMCOX.

THE ASHANTEE SPOILS.

THE show of this week is the collection of the golden spoils of Ashantee, which Messrs. Garrard, of 25 Haymarket, have patriotically saved from the melting pot by the purchase of them for the sum of 10,000*l.* from the prize agents of the army. Hastily collected together to make up the proposed indemnity, they consist of a great variety of objects, all of solid gold, many executed with such artistic taste and skill as to resemble the works of Etruscan or early Greek art. They have been all cast in a fine red sand, which imparts a reddish hue to the gold; and have some of them a filagree, granulated work attached to them, which gives rise to an interesting question through what connexion between Etruria and Africa it ever came there. The largest objects are some life-size heads in gold. All have the skull beaten in; the hair is represented by some corkscrew curls, a twisted wire marks the outline of the eyes, and the lips are fastened by large pins: they appear to represent a victim prepared for sacrifice, and have a loop either for suspending in the temple or round the necks of the officiating priests. The largest of these heads weighs sixty ounces, but there are some on a much smaller scale, with the lips pinned down. There are golden palates, with teeth, and various like objects, probably connected with the Fetish worship.

There are also large bosses, or fibulae, which appear to have been worn as badges of office, as the heralds sent by the King to Sir Garnet Wolseley wore them on their belt. Some of them measure four inches in diameter: they are all variously ornamented.

Two solid gold eagles which were on the king's chair of state, and some leopards which were on his cap, should be noticed. Some grotesque horns are also in the collection, probably the tops of sceptres; bracelets, some of great weight; rings of beautiful form, necklaces, chains, but no ear-rings. The king's state sandals, with massive buckles of gold; a bell richly ornamented, two scorpions curiously modelled, and various other objects. Two mighty sword-blades, like cleavers, supported on four golden balls like dumb-bells, and overlaid with gold, are said to have stood on each side the throne.

The whole collection is most interesting, and it is to be hoped portions of it will be secured for our national museums, as they are quickly passing into private hands. F. B. PALLISER.

ART SALES.

THE collection of objects of art and vertu of Mr. Edward Greaves, of Aroside, Warwick, was sold on Wednesday and Thursday week, by Messrs. Christie, Manson & Woods. The collection comprised about eighty specimens of Limoges enamel, being fine examples of all the most celebrated enamellers. The most important of these were—a fine upright plaque, painted with the entombment, in brilliant colours and gold, by Leonard Penicaud, 130*l.*; an oblong casket, with five plaques, by Penicaud the Second, 165*l.*; a large tazza, painted with the Meeting of Abraham and Melchisedek, in brilliant colours and gold, the back painted with masks and arabesques, in grisaille, signed "Susanne Court," 10 in. diameter, 260*l.*; a circular dish, by Susanne Court, painted with the Philistines filling up the Wells, in brilliant colours, with border of masks, vases of

flowers and chimerae, the back painted with arabesques and masks in grisaille, signed "S. C., Genes. XXVI.," 9½ in. diameter, 270*l.*; a fine oval dish, by P. Courtois, painted with Apollo and the Muses on Mount Parnassus, in grisaille and flesh-colour, from the designs of Marc Antonio, the back finely painted with the Infant Apollo and scrolls with satyrs, masks, and cherubs' heads, signed "P. Cortois, M. A. F.," formerly in the Visconti collection, 14½ in. by 19½ in., 500*l.*; a tazza, painted by Jean de Court, with the Departure of Jason in brilliant colours and gold, the back painted in grisaille and flesh colours, and the companion tazza, painted with the Return of Jason with the Golden Fleece, each 10 in. diameter, 294*l.*; a tazza by Pierre Raymond, painted with Dido entertaining Aeneas, in grisaille and flesh colour, date 1538, the stem and foot painted, 7½ in. diameter, 6 in. high, 81*l.* 18*s.*

THE Eddins sale of Bristol porcelain lasted three days, and the prices obtained were as follows:—The Burke chocolate cup and saucer, 93*l.*; the teacup and saucer of the same service, 80*l.* The cup and saucer of the Smith service, 55*l.*; and another, with the crest of a Cornish chough, 50 guineas. A large chocolate cup, made for Mrs. Cowles, of Bristol, 30 guineas; the others ranging from 11*l.* to 16*l.* A teapot and stand, 60*l.*, and the teaspoon of the same service, 4*l.*; other teapots, 30*l.* and 21*l.*; milk-jug, 24*l.*; sugar-basin, 12*l.* 15*s.*; jug, 21*l.* 10*s.*; a pair of bell-shaped mugs, 98*l.*; a heart-shaped dish, with classic vase in the centre, 90*l.*; another, oval, with a group of Cupids in the centre, 105*l.*, both figured in Mr. Owen's work. The fine compotiers with ram's head handles sold for 270*l.*; and the centrepiece with shells in tiers, corals, and other marine plants, 45*l.* The plaque, with medallion portrait of Benjamin Franklin, surrounded by a wreath of flowers in biscuit, sold for 150*l.* The hexagonal vase, painted four sides with landscapes, the other two in blue monochrome, was bought for 305*l.*; the four figures representing the quarters of the globe, 610*l.*; and a pair emblematical of Earth and Water, 141*l.*; a group in white porcelain of three female figures, 45*l.*; a pair of vases of Bristol glass, beautifully enamelled, 34*l.*; and a milk ewer, 24*l.* 10*s.* Plymouth porcelain sold also well:—a shepherd and shepherdess, 60*l.*; a white statuette of an actor, 43*l.*; and a pair of groups of children and goats, 30*l.* Of the Worcester porcelain, a pair of hexagonal vases, bleu de roi ground, painted with exotic birds, sold for 300*l.*; three bell-shaped mugs, with the portrait of the King of Prussia, sold for 33*l.*; a Bow centrepiece, 30*l.*; and the sale closed by a pair of Cupids, with bouquet, which fetched 18*l.* The whole realised was 6,200*l.*

THE collection of Mr. John Heugh, known as the Holmwood collection, was sold on Friday and Saturday by Messrs. Christie, Manson & Woods. Among the water-colour drawings, which were sold on the first day, were the following, with the prices given for them:—J. E. Millais, R.A., *A Dream of the Past: Sir Isambard at the Ford*, 5½ in. by 7 in., and *The Vale of Rest*, 4½ in. by 8 in., 220*l.* F. Walker, A.R.A., *The Postman*, 210*l.* O. Decamps, *Lessons are Over*, 173*l.* R. P. Bonington, *Shipping off the Coast of Normandy*, 152*l.* (Mr. Heugh gave 27*l.* for this); *The Rialto, Venice*, 131*l.* S. Prout, *Overhauling an Old East Indianman*, 152*l.*; *The Rialto, Venice*, 903*l.* Copley Fielding, *Staffa*, 240*l.*; *View towards Dungeness, from Fairlight Downs*, 508*l.*; *Sussex Downs*, 472*l.*; *Sussex Downs, Lewes in the Distance*, 519*l.* J. F. Lewis, R.A., *In the Desert: Coffee after Dinner*, 215*l.* P. De Wint, *Newark Castle and Bridge, Evening*, 493*l.*; *Matlock, Derbyshire*, 735*l.*; *Harvesting*, 498*l.*; *Barges on the Wilham*, 514*l.* David Cox, *Crossing Lancaster Sands*, 283*l.*; *Rocky Pass near Capel Curig*, 1,050*l.* W. Hunt, *Summer Flowers and early Fruit*, 525*l.* G. Cattermole, *The Baron's Hall*, 440*l.* F. W. Burton, *Cassandra Fiddle*, 525*l.* J. M. W. Turner, R.A., *Rafts on the Rhine*, 892*l.*; *Dartmouth Cove*, 892*l.*;

Dunstanborough, 855*l.*; *Carew Castle*, 1,155*l.*; *Interior of Westminster Abbey*, with inscription showing the painter's age, "Nat. 1775," 488*l.*; *Cassibury*, 787*l.*; *Pool and Cattle at St. Agatha's Abbey*, 945*l.*; *Edinburgh, from the Water of Leith*, 1,155*l.*; *View near Fonthill Abbey*, 735*l.* The next day's sale of the pictures included the following:—R. P. Bonington, *Dunstanborough*, 388*l.*; *A Coast Scene*, 262*l.* F. Goodall, R.A., *Arab Sheik and Camel*, 178*l.*; *Copt Mother and Child and Sheik of the Copt Quarter*, 189*l.* each. W. F. Yeames, A.R.A., *Queen Elizabeth receiving the French Ambassadors after the Massacre of St. Bartholomew*, 215*l.* W. Collins, R.A., *Stirling from the river Teith*, 1,102*l.* J. S. Cotman, *Mouth of the Yare*, 451*l.* P. Nasmyth, 1820, *A View in Sussex*, 903*l.* W. Holman Hunt, *The Festival of St. Swithin*, 367*l.* D. G. Rossetti, *The Annunciation*, 388*l.* Edouard Frère, *La Petite Laitière*, 9½ in. by 7 in., 157*l.* J. Tissot, 1871, *Summer Time*, 290*l.* Henriette Brown, *La Religieuse*, 336*l.* Ary Scheffer, *Head of Christ*, 278*l.* Paul Delaroche, *Execution of Lady Jane Grey*, 820*l.* Strafford going to Execution, 787*l.* W. Hogarth, *Portrait of Mrs. Hogarth*, 378*l.* T. Gainsborough, R.A., *The Great Tenor Singer of his Day Getting out a High Note*, 355*l.* Sir A. W. Callcott, R.A., *Tor Point Ferry, above Devonport*, 430*l.* Old Crome, *Hawthornden*, 556*l.* David Cox, *Crossing Lancaster Sands*, 472*l.*; *Going to the Hardest Field*, 1,102*l.* T. Faed, R.A., *The Silken Gown*, 598*l.* R. P. Bonington, *The Duenna*, 315*l.* T. Gainsborough, R.A., *Cattle and Peasants on the Banks of a River, with Boats*, from the collection of Rogers, the poet, 1,102*l.* J. Phillip, R.A., *Buying Chestnuts*, painted at Seville, 840*l.* W. Dyce, R.A., *St. Catherine*, 325*l.* W. Müller, *Flowers*, the artist's last work, 304*l.*; *Gillingham*, the artist's birth-place, 2,152*l.*; *Chess Players*, 4,053*l.* (being 103*l.* more than it sold for at the Gillott sale). J. M. W. Turner, R.A., *Dunstanborough, Morning after a Storm*, painted for Mr. W. Penn, of Stoke Poges, 4,305*l.*; *Windmill and Lock*, 1,837*l.*; *Old London Bridge*, painted about 1830, 3,255*l.* The total of the two days' sale was 56,768*l.*

NOTES AND NEWS.

ON Thursday evening, April 23, Mr. T. T. Wood gave a lecture on his discovery and excavation of the Temple of Diana at Ephesus, in the Museum of Art and Industry, Vienna, before a very numerous and select audience. He will shortly lecture on the same subject in Berlin.

M. JULES FERRY having paid a visit last year to the island of Melos, naturally made inquiries about the finding of the famous statue now known as the Venus of Milo, and though that took place as long ago as 1820, there were persons who remembered the event vividly, and described to him not only the condition of the statue when it was found, but also the violent scene which took place on its being embarked by the French. As to the condition, he was assured that when discovered the statue stood on a base, its left arm extended and holding an apple. This evidence he communicated to the *Temps* (April 16) as confirmation of the evidence on the same question just brought to light by M. Aicard, and consisting mainly of a description of the statue as it was found by a French captain, Matterer, who happened to be at Melos at the time. The left arm was broken in the scuffle at the embarkation of the statue, but the pieces were carried off with it. There have, however, always been some who have doubted whether these pieces of arm actually belonged to the figure, but now it is hoped such doubts will be put to rest. As to the base, the question is very different, because, though its existence, its appearance, and the inscription of the artist's name upon it, are well vouched for, the object itself cannot now be found in the Louvre. The loophole which is thus opened for doubting, at least, its having properly belonged to the statue, is taken advantage

of by those who regard the Venus as a work of the Praxitelean age, and not, as the inscription would imply, a work of the much later and feebler Rhodian school.

It is stated that several tombs have been discovered at Salonica, bearing inscriptions and allegorical figures, which would seem to imply a high antiquity.

THE archaeological expedition, recently mentioned in the ACADEMY as having been sent by the Austrian Government to explore the island of Samothrace, has already, it appears from the *Débats* (April 27), accomplished its mission. The principal operations were directed to the ruins of a Doric temple, of which the remains of a double line of columns have been laid bare, and some fragments of sculpture, greatly injured, belonging to the drums of columns, brought to light. Among other pieces of sculpture found inside the temple is mentioned a head of Pan.

THE *Levant Herald* states that Hassan Effendi Hindi, proprietor of a well-known establishment for the sale of Indian and Chinese curiosities, has received a commission to buy old white porcelain for the Sultan, and has left for Yokohama and Canton, via London and New York. He is to return in five or six months.

THE *Cologne Gazette* says that Dr. Hans Prutz, Oberlehrer in the Friedrich Werder'schen Gewerbeschule and Privatdocent at the University, were to set out this week, in company with Professor Sepp, from Munich, commissioned by the Imperial Government to proceed to Tyre in order to conduct excavations there, from which interesting discoveries are promised for the history of the Crusades.

DR. DETHIER has written to contradict a statement that the Greek tribunals had pronounced against his claim. He says that, considering a judicial compromise preferable to a doubtful lawsuit, he is endeavouring to come to a personal arrangement with Dr. Schliemann for the restoration of half the objects of archaeological value found on the site of Troy. Dr. Schliemann, however, the *Levant Herald* remarks, is represented as tenacious of his prizes, and although it is hoped that the mission to the Greek capital of the Director of the Ottoman Museum will eventually have a satisfactory result, it makes at present but slow progress. Dr. Dethier and Dr. Schliemann are both distinguished and enthusiastic archaeologists; they are both German savans; and, in their case, the spirit, if not the precise words of the old adage will doubtless apply, that "when Greek meets Greek, then comes the tug of war."

A PHOTOGRAPH has been taken at Munich, by Herr Hanfstängl, of Kaulbach's studio as it was left by the painter when he laid down his palette and brushes for the last time near the easel on which is spread the picture of the German knight Michel as the Archangel St. Michael. In the background a part of the wall may be seen, with the original chalk outlines of St. Arbues as an inquisitor, while to the right and left are studies of the painter's *Flood*, and other compositions. Kaulbach's last picture, which he completed only a few weeks before his death, is said to be one of his best, and to exhibit in the impassioned ardent face of the Archangel a harmony and beauty reminding one of the noblest of the master's works. We learn from the art correspondent of the *Allgemeine Zeitung* that Herr Hanfstängl has undertaken, in accordance with the express wishes and directions of the lamented master himself, to publish fac-similes of all Kaulbach's works.

THE Moorish and Egyptian houses which are to form one of the attractions of the new Alexandra Palace were on private view last Saturday. The idea of exhibiting these houses was suggested by Sir Edward Lee, and according to his plan, about twenty of the dwellings of the middle classes in various nations are to be erected from designs

furnished by Dr. Dresser. The greatest care has been taken to carry out every detail in strict accordance with the national art of the country represented, and in the Moorish and Egyptian dwellings, the first that have been completed of the series, a great success has been gained. The Moorish house is remarkable for its unrelieved whiteness and ugliness without, and its colour and beauty within. Figures are placed about it in real Moorish dresses, to assist the imagination in transporting us from Alexandra Park to the dominions of his Majesty the Emperor of Morocco.

THE *Commercio di Genova* announces that the men engaged upon the new harbour-works at Genoa have come upon an old Genoese galleon, which had been sunk by the Admiral Andrea Doria, in 1530, to stop the entrance to the harbour.

ANTON VON WERNER's great picture of the Unification of Germany is at present on view in the Royal Academy at Berlin, in order that the general public may have an opportunity of seeing it before it is sent to Venice, where it is to be reproduced in the form of a glass-mosaic, which is intended to form part of the national monument to Victory at Berlin. The painter, who has apparently had in his mind Paul Veronese's allegorical mode of representing the contest carried on by Venice against her allied foes under the form of Europa and her bull, has endeavoured to symbolise the leading events of the Gallo-Germanic war under mythological and other figures. Herr von Werner, who although scarcely more than thirty, is reckoned amongst the best historical painters of Germany, appears in his present work fully to have sustained the reputation for originality and vigour which attracted such favourable notice in his picture of the Arming of the German People after the Declaration of War in 1870. But, in the opinion of art critics, his last great work, admirable as it is in detail, and characteristic in its individual grouping, fails to convey the sentiments that it is intended to embody. The intangible nature of the idea to be expressed is, however, we should think, a sufficient explanation of this failure. To embody pictorially the conception of the call to Germany to arm, the response to that summons, the fraternisation of South and North Germans, and the establishment of the Empire, falls surely rather within the province of sculpture than of painting.

M. DE PAPELEU, a painter better known to artists than to the general public, is exhibiting at the Cercle de l'Union Artistique a large collection of studies after nature, the subjects of which are taken from various parts of France.

NICOLAS FRANÇOIS-OCTAVE TASSAERT, a French painter of some eminence, died on Saturday last, aged seventy-four. He was a pupil of Pierre Girard and Guillon Lathière, and made his *début*, as a portrait-painter, at the Salon of 1831. He afterwards painted several historical pictures for the Museum of Versailles, of which the most notable is the *Funeral of Dagobert*. He exhibited every year from 1831 to 1853, and among the best-known of his works are: *The Death of Correggio*, *The Death of Héloïse*, *Diana Bathing*, his *Slave Merchant*, *Unhappy Family*, and *Old Musician*, which have been popularised by engraving and photography. He won a medal at the Salon of 1838, another in 1849, and a third at the Exhibition of 1855, to which he contributed, among other pictures, *The Child Jesus asleep*, *The Son of Louis XVI. in the Tower of the Temple*, *Sad News*, and *Sarah the Bathing-Woman*. He died, we are sorry to learn, in great distress.

THE ancient tower known as the tower of Jean-sans-Peur or des Ducs de Bourgogne, situated in the Rue Tiquetonne, the only mediaeval work of fortification that Paris now possesses, has been bought by the municipality of Paris in order to ensure its preservation.

THE modern sculpture of the Louvre is being submitted to a cleaning process which has, it is

said, the most happy results. The cleaning is effected by means of a kind of little mop, dipped into a mixture of potash and freestone; with this the dirtiest heroes are vigorously attacked, and soon present quite a respectable appearance. Even the statues and marble groups brought from St. Cloud, Compiègne, and Versailles, which were much spoiled and stained by the acid washings of the foliage, have had most of their spots removed by this process. Could not our London statues be made to submit to the same operation? Sanitary legislation is much needed on their behalf.

THE *Zeitschrift für Bildende Kunst* is enriched this month (April) by an impression of Gaillard's magnificent etching of *L'Homme à l'Oeillet*, the celebrated Van Eyck of the Suermondt collection. The plate is a good deal worn, certainly, since it first appeared in the *Gazette des Beaux-Arts*, in 1869, but we should advise those who were not fortunate enough to gain possession of an impression then, not to lose this opportunity of securing a copy of this very notable work. The etching appears in illustration of an article by Dr. Woltmann, on the Suermondt Gallery, to which a portrait of the distinguished collector, Herr Barthold Suermondt, drawn by Knaus, gives additional interest. The Suermondt collection has long been celebrated as one of the richest private collections on the continent. W. Bürger, the well-known art critic, wrote a history and catalogue of it in 1860, and used to say that "the study of the Suermondt pictures had been his chief consolation in exile." It has been greatly enriched since then, and a new catalogue has been recently prepared containing some of Bürger's later criticisms, found among his notes after his death. Hitherto, as our readers probably know, Germany has been able to boast of this great collection, as Herr Suermondt resided at Aachen; but last summer he sent a great number of his paintings to the exhibition of the Société Néerlandaise de Bienfaisance at Brussels, and since then he has removed the whole of his collection there, and has followed it himself. His collection is still being exhibited in the large new rooms of the Museum for the benefit of the poor of Brussels, but Herr Suermondt is preparing a grand new gallery for its reception in the garden of a house that he has built for himself in the Rue des Arts. It will, therefore, prove a permanent addition to the art attractions offered by Brussels. In the second article of the *Zeitschrift*, O. Schnaase writes on the subject of the German Renaissance, reviewing especially Lübke's history of the same, of which he speaks in the highest terms of praise. Very little was known indeed of the Renaissance of art in Germany until Lübke undertook its history.

THE Academy of Rome has received a large contribution towards a sum which it is endeavouring to raise for the purchase of the house in which Petrarch was born at Arezzo.

THE Retrospective Exhibition, held at the Palace of the Corps Législatif for the benefit of the poor of Alsace and Lorraine, is about the most interesting art exhibition now open. It occupies the whole of the ground floor of the palace as well as the great gallery, in which the Morny collection and various *chefs d'œuvre* of all schools may be found. Among the most noteworthy contributions are the pictures lent by the Duc d'Aumale, which include the *Virgin of the House of Orleans*, by Raphael; Ingres' celebrated painting of *Stratonice*; the *Corps de Garde*, by Decamps; the *Duc de Guise*, by Delaroche; and many others of high reputation. The Rothschild collection of old furniture and objects of art and curiosity also excites great interest. Painters of the eighteenth century occupy one room, and painters of the modern school another; but living artists are not represented. The exhibition deserves, and will no doubt have, a great success.

THE new Municipal Museum of Saint-Germain is spoken of as being well worth a visit. It owes its origin to the liberality of M. Louis Ducastel,

an old inhabitant of Saint-Germain, who bequeathed a large collection of pictures, drawings, and other art objects for the purpose of its foundation. The pictures, we believe, are not very remarkable; but the drawings and several of the manuscripts are said to be extremely valuable.

THE STAGE.

FRENCH PLAYS AT THE PRINCESS'S THEATRE.

THE comedy of MM. Meilhac and Halévy, *L'Été de la Saint Martin*, produced at the Princess's Theatre, on Thursday night, is more than an elegant trifle. Its authors have been at great pains to write a work worthy of the Comédie Française, and by chastening their usual style, concentrating their constructive skill, and working into their picture two characters conceived in the freshest spirit and drawn in the truest colours, they have produced a play that will survive their more pretentious efforts. Suitably to its name, it is bright with sunshine, sunshine that warms but does not burn. Suitably to its name, it tells a story of subdued interest, tempered between the ardent heat of summer and the gloomy chill of winter. It touches no deep chord in the heart, but is now pathetically gay, now humorously sad, like the song of a Troubadour or a Minnesinger. The action takes place between the reading of two successive chapters of a romance. M. Briquerville, an old Touraine gentleman of high birth, sits in his arm-chair watching a beautiful girl, who is expounding to him from the novel of Alexandre Dumas the encounter of the musketeer D'Artagnan with the alguazils. The first volume is finished, and while Adrienne, the reader, goes for the second, the old man concerns himself with the history of her life. He knows that she has been staying in the house for a fortnight, that his housekeeper calls her niece and tells him that her father was a watchmaker, who had emigrated to America. It is true that the housekeeper had never before mentioned her relations during twenty years' service, and still has a tendency to confound Philadelphia with Pondicherry; but then, as she justly says, by force of repeating things for a fortnight one comes to forget them. So M. Briquerville leaves the investigation, content to enjoy the second summer which Adrienne has brought to him, and oblivious even of his latest trouble, a nephew whom he has renounced for marrying the daughter of an upholsterer. But when the young man comes to ask forgiveness he finds his uncle obdurate. Then Adrienne is called away by a sudden message: the old man refuses to let her go, reminds her that she had promised to read to him the whole series of Dumas' novels, and can only keep her promise by staying and becoming his wife. She has to confess, has to tell him that she is the tradesman's daughter whom his nephew has married. The shock is sudden, but he soon forgives her; the little family circle draws round his arm-chair, and Adrienne proceeds to the interview of the musketeer with the distressed Mme. Bonacieux. The stream of this pleasant story runs placidly along, neither impeded by epigrams nor swollen by a superfluity of interests. And though the play lacks genius, wants the characteristic of De Musset's delicate workmanship, it is not exaggerated to say that probably no living dramatists could have set so rare a gem in so tiny a frame.

It was interpreted in Paris by M. Thiron and M. Berton the younger, by Madlle. Croizette and Mme. Jouassain. The great merit of M. Thiron's playing was that though the old man was weak and irritable, now chafed into fury by the thought that the last of his race had married a grisette, now soothed into tenderness by the grisette herself, he commanded entire respect, and the blow that shattered his daydreams called forth most genuine sympathy. M. Perrier, who now represents the character, seems to be ignorant that he is dealing with an uncommon part. To denote rage he shakes his arms violently; to denote affection he simpers. Madlle. Croizette had the great ad-

vantage of being schooled in her part by M. Bressant. But the genius which is in her, and which is now attracting so much attention, first came to light in this play. With a rapid glance whenever her husband was mentioned, with a changed voice whenever she resumed the reading of the novel, scared when she found she had poured out a wine too strong for the old man's head, and finally throwing on herself all the blame of the conspiracy, Adrienne was shown to be a most artistic creation. Mme. Andrée Kelly, of the Princess's Theatre, is tender and womanly, but scarcely conceals the art with which Adrienne fascinates M. Briquerville. If she played a trifle more slowly, and were a little less inclined to theatrical gestures, her method of interpretation would be entitled to considerable praise. It is perhaps scarcely fair to compare an average body of comedians with the most perfectly organised company in the world; but the misconceptions of the actors tend to obscure the beauty of the play.

The comedy that followed, *Gavaut, Minard, et Cie*, by Edmond Gondinet, does not belong to so high a class. There is much in it that must have caused the dramatic censor to blush, but he has not allowed his modesty to interfere with the action. Gavaut, Minard and Company are cotton manufacturers of St. Sever, near Rouen. Gavaut has three daughters, one of whom is to marry his excellent clerk, M. TERENCE. Minard has a wife, a romantic person, lately rescued from a railway accident by a man she believes to be concerned in an assassination that has thrilled the country. And it is to be presumed that the firm in its official capacity has a son, for an anonymous letter addressed to the house and entreating it to take charge of its child, is so far from being repudiated that the conscious-stricken partners return answer that they will adopt the young man referred to. A young person called Theodore appears, and is received by the firm as its son; but Madame Minard recognises him as the assassin who saved her. The recognition startles Gavaut and Minard: they devise plans for the murderer's escape, and are much troubled by finding in the house the sword, pouch and boots of a gendarme. But it appears that the anonymous letter was addressed to their exemplary clerk, and related to a child of tender years, that Theodore is not the assassin, and that the gendarme is one of the retainers of Toinette, domestic. TERENCE is dismissed, Theodore replaces him, Gavaut and Minard embrace one another, and Toinette hangs out of window the signal for her lover to return.

This is a fair specimen of the farces which are played at that uncomfortable little Parisian theatre, situated in the corner of the Palais Royal, and which are now becoming painfully familiar to English audiences. In all of them very ordinary people, such as Bouchencœur and Calino, such as Tricoche and Cacolet, are placed in impossible situations, the exuberant drollery of which can only be appreciated by French minds; the characters are then provided with catchwords, and the dialogue is so compressed as merely to explain the story. And the fact that they are generally unsuited to our stage is not so much due to the radical difference of English and French notions of propriety as to the difference of our perceptions of the ludicrous. *Box and Cox* would probably be tedious to a Parisian; *Le Voyage de M. Perrichon* has been shown to be tiresome to Londoners. But we should certainly be able to enjoy these pieces more thoroughly if we had actors who could enter into their extravagance.

MM. Schey and Didier, the representatives of Minard and Gavaut, are excellent grotesques. The former lacks the unction of M. Lhéritier, the original Minard; the latter wants the geniality of M. Geoffroy, the original Gavaut; but the characters are so slightly sketched that they admit of various interpretations. M. Schey as an elderly gentleman prouetting about his office is very amusing. With the face of an idiot and the legs of a marionette, fooled by his wife, his clerk, and

his partner, Minard carries his imbecility to the limits of becoming mirth. Gavaut is his complement, a man born for strife, who has by his exertions raised cotton to the level of a principle, and hopes to represent its interests in the Chamber. M. Didier is a little too boisterous, but the quarrels of the partners amused the audience exceedingly. Mme. Wilhem sustained with success the part of the romantic Madame Minard, who, when she sees her ideal murderer in his shirt-sleeves, still thinks him sombre, fatal, and superb, and determines to rescue him from justice. The minor characters were fairly played, and both pieces were received with unmeasured applause.

WALTER MACLEANE.

MR. LEOPOLD LEWIS's drama, *the Bells*, has been revived at the Lyceum Theatre, Mr. Henry Irving appearing as the Burgomaster Mathias. Practice having mellowed the voice and moderated the gestures of this noted actor, he is now enabled almost completely to realise his original and daring conception. The death-scene at the end will be rivalled at the Princess's Theatre on May 11, when Madlle. Favart will perform for the first time on the stage the part of Blanche de Chelles in M. Octave Feuillet's new play, *the Sphinx*.

A COMEDY in one act by M. Eugène Labiche, one of the most prolific playwrights in France, and M. Ernest Legouvé, of the Academy, has been read to the committee of the Théâtre Français. It is to be entitled *La Cigale chez les Fourmis*, and the chief characters will be enacted by M. Delaunay and Madlle. Tholer.

THE benefit given to M. Landrol, of the Gymnase Theatre, was made remarkable by the reappearance of the old actor, M. Bouffé, in MM. Cogniard's drama *Pauvre Jacques*. He first sustained the part of the broken-down musician in this play on September 15, 1835.

THE Court Theatre has revived the comedy of Mr. John Brougham, *Playing with Fire*, which was produced on September 28, 1861, at the Princess's Theatre under the management of Mr. Augustus Harris. The principal characters were then played by Mr. George Jordan, the author, and Miss Rose Leclercq.

MDME. CHAUMONT, M. Berthelier, and a company from the Variétés Theatre, have left Paris to perform in the provinces. It is said that they will come to London and introduce to an English audience MM. Meilhac and Halévy's latest plays, *La Petite Marquise*, a piece scarcely worth the expense of carriage, and *Toto chez Tata*, the witty monologue delivered by Mme. Chaumont.

MR. TOOLE performs this morning at the Globe Theatre in Mr. Dion Boucicault's play, *Dot*.

M. OFFENBACH has in preparation a new operetta called *Mademoiselle Bagatelle* in which Mme. Judic will appear.

M. AMBROISE THOMAS's latest work, *Gille et Gillotin*, has not made its way to the boards of the Opéra Comique without difficulty. The composer alleged that the music was frivolous and unworthy of his dignity as Director of the Conservatoire. The author of the libretto contended that it was written in an excellently humorous vein, and sued M. Thomas for breach of contract in refusing to have it performed. The Court held that the piece was in all respects fit for representation, and the public has confirmed its decision.

THE new comedy, *Mont Blanc*, by Messrs. Henry and Athol Mayhew, will be produced at the Haymarket Theatre on Whit-Monday, May 25.

THE productions of the week at Paris are, first, a revival of the *Périchole*, by Offenbach, in which Mme. Schneider sustains her original part; and second, an operetta in four acts, by MM. Jaime and Gille, music by M. Coste, called *Cent Mille Francs et ma Fille*. Both were successful.

MUSIC.

CRYSTAL PALACE.

MR. MANNS'S annual benefit-concert which, according to custom, was given last Saturday, at the close of the winter series of Saturday concerts, was, as regards both selection and performance, worthy alike of himself and of the institution with which he has so long and honourably been connected. We have so often expressed our opinion of Mr. Manns, that it is needless to repeat it here; we therefore proceed at once to notice last week's music. And, to begin and finish our fault-finding as soon as possible, let us first say, in the most emphatic manner, that the concert was very much too long. An hour and a quarter of miscellaneous music, and after that the whole of Beethoven's Choral Symphony, is far too great a strain upon the attention both of hearers and players, especially if it is remembered that the latter have a long rehearsal in the morning. The consequence is that towards the close of the concert many of the players are (to use their own words in relation to it) "dead beat," and the performance must inevitably suffer. Nor, on the other side, can the audience fully enjoy so elaborate and profound a composition as the Choral Symphony if the edge of their musical appetite has been already taken off by serving up six or seven courses before the *pièce de résistance*. Would that all concert directors could be brought to see that the most judicious thing is always to send away their audiences hungry, rather than, let us say, more than replete!

The most interesting feature of Saturday's concert was the first performance in England of a selection of Schumann's incidental music to Lord Byron's *Manfred*. The overture to the same work, which opened the concert, has been several times previously heard at Sydenham, but has probably never been more finely played than on this occasion. It is one of the grandest pieces of "character-music" (not "programme-music") which exist—of a sombre, almost weird tone, well befitting the subject. The selection from the incidental music comprises the delicious "Adjuration of the Witch of the Alps," the "Hymn of the Evil Agencies," and "Manfred's Address to Astarte." Of these three numbers the first and third are "melodrama"—that is speech accompanied by music; happily on this occasion the speaking was omitted, greatly to the improvement of the effect. However suitable on the stage, recitation with music is more often a distraction, not to say a nuisance, in the concert-room, than otherwise. It is much to be hoped that next season Mr. Manns will add to our obligations by giving the whole of the *Manfred* music at one of the concerts.

Another most interesting item on this afternoon was M. Gounod's quaint and piquant "Funeral March of a Marionette"—a really charming piece of musical pleasantry. It was played to absolute perfection under the composer's direction, and enclosed.

A young violinist, Herr Otto Peiniger, a pupil of Herr Joachim, made his first appearance in Ernst's *Hungarian Fantasia*. He is of considerable promise, but, as yet, hardly fully fledged. Of the miscellaneous vocal pieces we can only mention two pleasing songs by Mr. Manns, sung by Madame Lemmens-Sherrington and Mr. Santley, but must give a special word of praise to that thorough artist, Madame Otto-Alvsleben, for her excellent rendering of Elizabeth's song from the second act of *Tannhäuser*. Of the Choral Symphony—in which the solo parts were sustained by Madame Sherrington, Miss Antoinette Sterling, Mr. E. Lloyd and Mr. Santley—it is only necessary to say that it went very well, and would probably have gone even better had the band not been fatigued with so much previous work.

EBENEZER PROUT.

THE 136th anniversary festival of the Royal Society of Musicians took place on Monday last

at Willis's Rooms, when H.R.H. the Prince of Wales presided, and H.R.H. the Duke of Edinburgh was also present. The list of donations read by the secretary (Mr. Stanley Lucas) amounted to about 1,000*l*.

THE competition for the "Sterndale Bennett Scholarship," at the Royal Academy of Music, which has recently been held, has resulted in the election of Master Charlton Templeman Speer, aged fourteen.

HERR JOACHIM has sent to the committee for the erection of a monument to Bach at Eisenach, the sum of 3,000 thalers (450*l*.), as the proceeds of several concerts given by him for that object in this country.

WE regret to learn that Dr. von Bülow, who is at present at Warsaw, is ill. The *Neue Zeitschrift für Musik*, our authority for the statement, gives no particulars as to the nature of the malady.

HERR HANS RICHTER, conductor of the Hungarian National Theatre at Pesth, is shortly going for three months to Bayreuth, to prepare with Wagner for the Nibelungen performances. Herr Richter has been selected by the composer as the conductor at the great festival.

JOHANNES BRAHMS was to visit Bremen on the 28th ult., to take part in a concert for a charitable object.

THE commissioners of the Zurich Musical Festival, to be held during the present year, having offered prizes for the best cantatas to be written for that occasion, have just announced the award of the judges. The first prize is gained by Herr Georg Rauchenecker, of Winterthur, and the second by Herr Rudolf Weinwurm, of Vienna.

THE opera *Diana von Solange*, by the Duke Ernest of Coburg-Gotha, has lately been produced for the first time at Rotterdam, but has made a *fiasco*.

THE programme of the festival at Prague in celebration of the centenary of Tomaschek (mentioned in the notes of last week's ACADEMY), included his *Requiem* in C minor; concert-overture in E flat; "Hector's Abschied," a duet for soprano and bass with orchestra; "Zigeuner-Nachtlied," chorus with orchestra; final scene from Schiller's *Braut von Messina*; and "Gloria" from the Coronation Mass, besides songs and pianoforte solos. The whole of the works performed were compositions of Tomaschek: some of them might probably be worthy of the attention of our concert directors.

A new musical journal has been started at Brussels, under the title of *L'Harmonie: Organe des Sociétés Instrumentales et Chorales Belges*.

THE Italian impresario Sanguinetti has lately died at Genoa, at the age of seventy-four. He was the first to recognise the talent of Verdi, and to smooth for him the difficulties of the earlier part of his career.

C. T. BRUNNER, in Germany well-known as a writer of pianoforte music, died on the 14th ult., at Chemnitz, in the eighty-second year of his age.

THE series of summer concerts which commences to-day at the Crystal Palace will be of unusual novelty in their scheme. Seven of the nine concerts to be given will be illustrative of the music of various nations: Germany, England, France, Italy, Russia, and the Scandinavian countries. Another concert will be devoted to a performance of Signor Randegger's "Fridolin," and the last will be illustrative of humorous music.

THE *Leeds Express* of Tuesday afternoon states that the Leeds Musical Festival has been definitively fixed to begin on October 5, and will last four days. Sir Michael Costa will be the conductor. Accommodation will be afforded in the Victoria Hall for 2,350 persons. The Mayor is chairman of the general committee. The Guarantee Fund amounts to nearly 6,000*l*. It has been arranged

to hold a musical festival in Liverpool similar to those which have been so successfully carried out in Birmingham and other towns. A preliminary meeting of the promoters was held on Monday at the Town Hall, the Deputy Mayor, Mr. E. Whitley, presiding, and Sir J. Benedict being among those present. It is proposed to offer a number of valuable prizes for competition. The festival is to be held about the beginning of October, the proceeds being devoted to the charities of the town.

A "NORTH-WEST German Musical Festival" is announced to be held at Oldenburg in the course of the summer.

POSTSCRIPT.

MESSRS. LONGMANS announce that they have in preparation an authorised translation of Comte's *System of Positive Polity*. It will be completed in four volumes 8vo., to be published separately, and each forming in some degree an independent treatise. The volumes will be:—I. "The General view of Positive Polity and its Philosophical Basis." Translated by J. H. Bridges, M.B. II. "The Social Statics or Abstract Laws of Human Order." Translated by F. Harrison, M.A. III. "The Social Dynamics, or the General Laws of Human Progress" (the Philosophy of History). Translated by E. S. Beesly, M.A. IV. "The Synthesis of the Future of Mankind." Translated by R. Congreve, M.A.

MESSRS. LONGMANS also announce that *Essays, Political, Social, and Religious*, by R. Congreve, M.A., will be ready in May, and that the Greek text of the *Politics* of Aristotle, with English notes by the same author, is in the press.

WE hear that Lord Somers has been appointed a Trustee of the British Museum in the room of Bishop Wilberforce deceased.

THE *Athenaeum* states that Mr. George Smith, of the British Museum, has arrived with his Assyrian treasures at Aleppo on his way home.

SATURDAY, MAY 9, 1874.

It is particularly requested that all letters respecting subscriptions, the delivery of copies, and other business matters, be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Sketches in Italy and Greece. By J. A. Symonds. (London: Smith, Elder & Co., 1874.)

SKETCHES is perhaps scarcely the right word for pictures of travel so careful in composition, so finished and elaborate, as these by Mr. Symonds. In one way the various studies in this volume are almost a new thing in literature. Mr. Symonds has applied to well-known and familiar southern scenes, and to historical cities, the same kind of criticism as that by which Mr. Pater "disengages the *virtue*" of certain artists and poets, in his *Studies of the Renaissance*. He brings before the reader the very secret of the charm of Perugia or Gironi; he grasps and expresses the personality, as it were, of Ravenna or of Orvieto; he conveys the sentiment of Syracuse or of Athens. To do this with such precision implies a delicate feeling for scenery, which enables the writer to seize the hour of sunset, or dawn, or mid-day light, which most enhances the characteristic beauty of the chosen place—as well as a complete knowledge of the historical past of the scene and of its associations. From these memories Mr. Symonds selects with unerring instinct the most appropriate, some moment of contrast, of advance or decay, in one of the many civilisations that have lived and perished on the shores of the Mediterranean. How complete the writer's knowledge of the fairest of these civilisations is, how truly classic Greece is still living Greece to him, his last book on the Greek poets proved beyond dispute. The present volume shows him just as much *en rapport* with the spirit of mediæval Italy, as able to sympathise with the pleasures and griefs of monastic painters and turbulent princes, as with the artists and athletes of Hellas. Intimate knowledge of beautiful forms of life that have ceased to exist, delicate feeling for natural beauty, and for the varying sentiment with which natural beauty is clothed by the memory of the transient human efforts of which it has been the impassive witness, these are Mr. Symonds' qualities. The results, his impressions and fancies, are expressed in language at least as sonorous and gorgeous as prose may dare to be. Sometimes we may think that the colour and beauty of mere words becomes a temptation to him, that his style has a southern fragrance as heavy as that of the lemon blossoms, and a glitter in Asiatic taste. A passage of this sort occurs in the otherwise admirable description of the Syracusan quarries, where so many Athenian captives died of heat and cold and thirst. To speak in that passage of the "dawn walking forth fire-footed," of the "unfettered clouds sailing in liquid ether," seems to strike a wrong note, to check the reader's

sympathy, and recall him from thoughts of "old unhappy far-off things," to doubts and questions about English prose. But such less fortunate expressions are rare, and in compensation Mr. Symonds never delays one over matters of pedantry or minute questions in history and architecture. These have their places, but in such pictures they would be out of place, and happily they are absent.

Few of these essays display Mr. Symonds' manner of working better than the first of all, that on the Cornice. It would almost be necessary to quote the whole study to give an idea of the delicacy with which the sentiment of the land is felt, and the skill with which it is expressed. The sky and the sea, the dark wells of "black water," and the gadding violets speak of Theocritus, of Pan and the Nymphs; while among the secular olives "we dream of Olivet, or the grave Garden of the Agony, and the trees seem always whispering of sacred things."

"Polyphemus was born there in the Gorbio valley. There he fed his sheep and goats, and on the hills found scanty pasture for his kine." To tell the truth, the duties of Polyphemus must have been almost as much a sinecure, and as free from vulgar associations as those of Channing's Otaheitan Shepherd in the island where there were no sheep. There is no grass worth mentioning, and the strange and stringy flocks which supply the invalids of Mentone with mutton, are driven along the beach every morning to hunt wistfully for stray lemon peel. Talking of the same invalids reminds us that there is a point of view from which Mr. Symonds has not regarded the Riviera, and a sentiment he has not expressed—that of the many who come there as to a last harbour and shelter of waning life, and a place where "more than ever it is sweet to die." This sentiment is the theme of an article of curious delicacy and finish, contributed by Mr. Stevenson to *Macmillan's Magazine* for May.

Perugia is the subject of another essay, not less remarkable for beauty of what used to be called word-painting, and for choice of happily contrasted historical associations:—

"Perugia is the empress of hill-set Italian cities. Southward from its high-built battlements and church towers the eye can sweep a circuit of the Apennines unrivalled in its width. From cloud-capped Radicofani, above Pieria in the west, to snow-capped Monte Catria, beneath whose summit Dante spent those saddest months of solitude in 1313, the mountains curve continuously in lines of severe dignity and tempered sweetness. Assisi, Spoleto, Todi, Trevi, crown lesser heights within the range of vision. Here and there the glimpse of distant rivers lights a silver spark upon the plain. These hills conceal Lake Trasymene and there lies Orvieto, and Ancona there, while at our feet the Umbrian champaign, breaking away into the valley of the Tiber, spreads in all the largeness of majestically converging mountain slopes. . . . City gates, sombre as their own antiquity, frame vistas of the laughing fields. Terraces, flanked on either side by jutting masonry, cut clear vignettes of olive-hoary slopes, with cypress-shadowed farms in hollows of the hills. Each coign or point of vantage carries a bastion or tower of Etruscan, Roman, mediæval architecture, tracing the limits of the town upon its mountain plateau. Everywhere art and nature lie side by side in amity, beneath a sky so pure and delicate that from its limpid depth the spirit seems to drink new life. What air-tints of lilac,

orange, and pale amethyst are shed upon these vast ethereal hills and undulating plains! What wandering cloud-shadows sail across this sea of olives and of vines, with here and there a fleecy of vapour, or a column of blue smoke from charcoal burners on the mountain flank. To southward, far away beyond those hills, is felt the presence of eternal Rome—not seen, but clearly indicated by the hurrying of a hundred streams that swell the Tiber."

It was amidst this affluence of natural beauty that "beneath the fierce blaze of the Renaissance were brought into splendid contrast both the martial violence and the religious sentiment of mediævalism, raised for a moment to the elevation of fine art." Here the Baglioni were slaying each other—beautiful in their stealthy ferocity as the young Greeks who used to murder tyrants "for some love-adventure;" and here Perugino was painting "devout young faces upon twisted necks, with a background of limpid twilight and calm landscape." The "blood-bedabbled cathedral square and the rugged stonework of San Lorenzo call up by the law of contrast the Close of Salisbury and

"The cushioned ease of immemorial Deans."

Our modern spirit can gain, as Mr. Symonds says, an equal pleasure from all the past. We are wise and happy, if at all, with the happiness and wisdom of serene old age; spectators of the passions of the dead, and the procession of the years. This compensation time has given us, who can produce nothing, and who possess all things, who can understand and forgive only too easily, who in a sense see the whole world, "and behold, it is very good."

The main interest of the essay on Rimini lies in the account of Leo Alberti, a spirit of the modern time, born into the more active world of the Renaissance.

"In the early spring, when he beheld the meadows and hills covered with flowers, and saw the trees and plants of all kinds bearing promise of fruit, his heart became exceeding sorrowful; and when in autumn he looked on fields heavy with harvest, and orchards apple-laden, he felt such grief that many even saw him weep for the sadness of his soul."

He found beauty everywhere, and, like Mr. Whitman, the noted American writer, loved to gaze on what that poet calls "majestic old persons."

At Ravenna, the innocent multitudinous life of harmless creatures in the pine forest, the dry and scented air, enhance the beauty of the recollection of Dante's austere exile. The "charm of its summer solitude" informs passages of the "Paradise," and must often have won him from brooding over the civil strife of Florence and his own wrongs. Were he living now, the thought occurs, would he not think Florence well lost, for the privilege of "beholding sun and stars" from many lands and in various skies? But the genius of his time was not disposed, like Fulke Greville, and like our author, "to seek comfortable ease in the safe memory of dead men, rather than disquiet in a doubtful conversation among the living."

It would be pleasant, did space permit it, to discuss Mr. Symonds' analysis of the Corregiosity of Corregio, and to show that Northern Italy at least retains tragic narrative ballads, as well as mere *scholia*, and

swallow-songs of love. One might urge, too, that Mr. Symonds is needlessly severe on some comparative mythologists. Without agreeing with Mr. Cox, even an opponent must observe that it is unfair to speak of his system as "creating an obscure conviction that the greatest race of artists the world has ever produced were but dotards, helplessly dreaming over distorted forms of speech and obsolete phrasology." Even if the germ of the conception of Achilles arose from a philological misconception, Homer would no more be proved "a dotard, helplessly dreaming," than a knowledge of mineralogy would produce an obscure conviction that Pheidias was a person who potted away his time chipping at limestone.

It is pleasant to turn from this irritating matter to Mr. Symonds' account of Athens:—

"The sensitiveness of the Attic limestone to every modification of the sky's light gives a peculiar spirituality to the landscape. The hills remain in form and outline unchanged, but the beauty breathed upon them lives or dies with the emotions of the air from which it emanates: the spirit of light abides with them and quits them by alternations that seem to be the pulses of an ethereally communicated life."

It would not be possible to paint with more truth, and more delicate fancy, the atmosphere in which the old Athenians moved, *ἀεὶ ἐπὶ λαμπροῦτον βαίνοντες ἀθρόως αἰθέρος*—"ever delicately moving through most translucent air."

It is not easy to estimate too highly the usefulness of a book like this. We English on our travels are apt "to glance, and nod, and hurry by," or, like the hero of *Happy Thoughts* in the feudal castle, to grope helplessly about in our memory and imagination for a recollection or a feeling. Mr. Symonds' sketches supply these in a form so light, that even the American young ladies who sucked lemons at Verona, and made Mr. Ruskin so angry, might tolerate them; and so graceful, that the most accomplished scholar must turn to them with enjoyment. It is a great pleasure to read the book at any time, and it must be doubly a pleasure in the scenes where it was written. Such works widen the field of noble delights, and enable increasing numbers to enter into the heritage of nature, and the wealth that the past has bequeathed to us.

A. LANG.

TWO BISHOPS.

Life of John Coleridge Patteson. By Charlotte M. Yonge. Second Edition. (London: Macmillan & Co.)

Thomas Grant, First Bishop of Southwark. By Grace Ramsay. (London: Smith, Elder & Co.)

NEITHER of these books is particularly well written, and one hardly feels even that either is quite complete, or that the incompleteness is due merely to the reticence which is inevitable in speaking of a man but lately dead. It is true Miss Yonge has had access to the correspondence of Bishop Patteson's family and most intimate friends, and Miss Ramsay has had the confidence of the Convent at Norwood; but Miss Ramsay herself seems to admit that she has scarcely been in

a position to give a comprehensive view of Bishop Grant's life; and when Miss Yonge tells us of thirty-five letters sent home by a mail of which she has only seen two, it may be doubted whether the two were the best worth quoting. When a man is fresh and has something to say, he writes to strangers, when he is tired and wants rest he writes to his nearest and dearest. And even if it were possible to be sure that we had the best possible selection of Bishop Patteson's letters, it may be doubted whether it would not do more justice to his memory to condense the impression they are adapted to leave, than to reprint the grounds for it *in extenso*. Miss Ramsay's book may be incomplete, but at any rate it is a book; Miss Yonge, who had the opportunity of writing a fine book, has contented herself with giving posterity a well-assorted collection of materials. However, at worst, Miss Ramsay is readable and Miss Yonge is instructive, and perhaps both are sufficient in the sense that they enable a diligent reader to reconstruct approximately the images of two remarkable lives, which raise a question of permanent interest: What is the place of saintliness in modern life?

Each represents a different type of spiritual culture, corresponding oddly enough to the different methods of bodily hygiene approved in classical antiquity and in modern England. With the ancients physical perfection was an end in itself, and the conscious possession of it was one of the great prizes of life, as the elaborate training which was necessary for attaining this end was a principal part of its business. To the moderns this perfection is chiefly valuable as a condition of practical efficiency, and is attained as an incidental result of energetic industry and strenuous recreation. We readily admire the bodily gymnastics of the contemporaries of Pindar and of the contemporaries of Plato; with an effort we can bring ourselves to praise the more difficult gymnastics of Saint Antony; perhaps it is only our prejudice which determines us to be edified when Bishop Patteson brings the loaves himself for the Synod's breakfast because there was no one else to send,* and to be puzzled, if not scandalised, when Bishop Grant is caught *en flagrant délit* of mortification, emptying the salt-cellar into his tea-cup, or peppering an orange that had been carefully sugared for him. The contrast is more piquant, because it was crossed, so to speak, by a contrast in the original disposition of the men. Bishop Patteson was naturally—there ought to be nothing whatever offensive in the phrase—much more of an egotist than Bishop Grant. No one could have been further from a disposition to sacrifice others to himself, or to seek pleasure or satisfaction at the expense of duty: on the contrary, he spent, and was spent in the service of others; he not only tried to do his duty, but to know it, and was ready to the last for fresh calls; and yet with all this, his own solid, slow-moving personality was the centre of the world to him. Self-consciousness is too narrow a word for this frame of mind, and selfishness, which the Bishop himself employs

* This is mentioned in an interesting letter, which illustrates a tendency of men who are thrown back upon the rudiments of life to take them for its only realities.

in a self-accusing letter, after the severe illness which preceded his martyrdom, is so unjust in its severity as to make one wish that he had abstained from self-judgment altogether. If it were possible to describe him without judging him, we might say it was his nature to live more in his own desires, which were all upright, and noble, and pure, and less in the desires of other men, than is precisely common among those whose desires are less exalted. To Bishop Grant selflessness was as curiously easy as it was difficult to Bishop Patteson. He did his own duties methodically, almost mechanically, we should say, but for the inventive ingenuity with which he rendered surreptitious services to others. This was almost the only manifestation of individuality in a life which went as sweetly and as regularly as a musical clock. It would be curious to know whether the excessive scrupulosity which was the torment of his life was not itself due to the absence of all personal impulse, which exposed him, an unresisting and disinterested victim, to every imaginable conflict of external claims, while the complicated duties of a priest and bishop made the occasions of such conflicts numerous. It certainly coincides with this hypothesis that his scruples disappeared when he was saying mass, the only thing he naturally wanted to do, inasmuch that during his last illness, at Rome, when he had put himself under obedience to a brother prelate, he could not resist the temptation of getting up and saying mass.

The selflessness of which we have been speaking was connected with an entire absence of any sense of personal dignity, of which there is a very pretty illustration *à propos* of a little vulgar boy who wanted to carry his bag from the station, and said, when the Bishop declined, "Then you're no gentleman." "Perhaps not, my dear, perhaps not."

As little was known of Bishop Grant outside his own communion, it may be well to mention that he was the son of an Irish soldier, who rose from the ranks to be captain and quartermaster; that he was Principal of the English College at Rome, and took part in the negotiations which gave the Pope and his new hierarchy some right to feel surprise at the Durham letter and the Ecclesiastical Titles Act. On his appointment to the see of Southwark he made himself especially useful in making arrangements with the Government for military and prison chaplains, which were facilitated by his scrupulous fear of seeming to encroach. He about tripled the staff of priests and religious at work in his diocese, and seems to have had his fair share of converts: he had a curious way of testing the sincerity of inquirers by setting them to learn the penny catechism. He died in 1870, at Rome, of cancer, from which he had long suffered. We may mention that his sufferings ceased altogether for three months under the influence of the happiness which it gave him to be permitted by his advisers to attend the Council of the Vatican. There are other instances of the same kind, on which the authoress is careful to lay little stress, which tend to raise a question that is hardly likely ever to be rationally discussed and authori-

tatively determined—how far the common conditions of life are or may be modified for those who practise great austerities, and live much with the unseen. Doctors have dwelt too exclusively upon the chances of illusion in such a life, and have not sufficiently considered the possibilities of change in the relations of an organism so modified to the real forces of things.

Of Bishop Patteson it may be said that he had force enough of mind and character to have made him considerable in a secular career, which can hardly be said of Bishop Grant. He was the son of Mr. Justice Patteson; he was prosperous and conscientious at Eton; but intellectual employment was rather against the grain with him there, and even at Oxford, for which he reproached himself rather unreasonably in after life, as it did not occur to him that the time at which the brain asserts its supremacy over the body depends upon causes beyond human control. A good deal can be done to profit by it; very little to hasten it. That time never comes to many; to him it came rather late.

The occasion of his intellectual awakening was a tour in Italy, after which he got a fellowship at Merton. After this he spent a long vacation in Dresden, and began the study of Hebrew and Arabic, having begun to recognise his singular ability as a linguist. In 1853 he was ordained to a Devonshire curacy near his father's home. After he had been there two years, his life was determined by a visit from Bishop Selwyn, who was in England to collect men and money. The impulse was rather decisive than strong. It is always heroic for a man to leave a life that is easy, familiar, and honourable for a life that is hard, obscure, and strange. The peculiarity of Patteson's heroism, of which the praise must always be shared with his father, is that they decided upon a great change as if it had been a small one: they were able to do what they thought right and reasonable (reasonable because right) with very little of agitation or effort, or what we call enthusiasm; and therefore, it may be, with very little regret. Patteson loved his father above most sons; but, to his own surprise, he felt the separation little, and his father's death less. He sailed in 1855, and he never returned. His time was divided, both as priest and bishop, between voyages in the Melanesian Archipelago and the instruction of the native boys he collected in a missionary college, first in New Zealand, latterly on Norfolk Island. The tropical climate suited his chest, but his health suffered from the enforced vegetarianism. The splendour of the tropical scenery dazzled him at first; afterwards its monotony palled upon him, and he pined for Devon lanes. The natives attracted him strongly at first; they were such amiable animals. He lived through the disappointment of finding they were naturally little more, to attain, after nearly sixteen years' work, to the happiness of admitting them by hundreds to full Christian privileges. There was more of awe than of exultation in his happiness. Miss Yonge's motto—"Thine heart shall fear and be enlarged, because the multitude of the sea shall be converted unto thee"—is one of the few literary felicities in her book. Per-

haps the overwrought description of the dead body of the martyr, as the tribe that murdered him gave it back, with its five wounds wrapped in palm, may almost count for another. It is impossible to pity him: if his work has a future, it will be served by his death; and his strength was broken, and he died without pain. Mr. Atkin, who was wounded at the same time, and brought back the bishop's body, died a more miserable death than we would willingly think it possible to die in such a cause. He resigned himself when he saw it was coming; but, before it came, the brute pain had been too strong for the spirit of the man. He could send no message home, he said; "I lost my wits when they shot me." He was asked if he would have a little sal volatile. "No." "A little brandy?" "No." "If he wanted anything?" "Nothing but to die." It is almost enough to make one a nihilist to read this.

Then one asks, Was it well that any man should sacrifice his happiness and his usefulness at home to save a few hundreds of a race that is perishing in this world from *poena damni* in another. For it seems clear that the Melanesians were perishing even before the process was accelerated by the slave trade, which made it impossible for the Bishop to visit many islands whose languages he had laboriously mastered. We learn that one of the worst evils of the trade is the tyranny of the coolies who live to return with a gun and ammunition. Of the islanders we learn less than could be wished: perhaps the two most remarkable points are that his acquaintance with Melanesian dialects led Patteson to the conclusion that Hebrew grammar will have to be remodelled without reference to the analogies of more highly organised languages, like Greek and Latin;* and that one of the first effects of missionary teaching was to destroy the power of the native sorcerers to practise their enchantments with effect.

These additions to our knowledge are likely to be the only lasting results of his life in this world, but after all he had to follow his star.

Bishop Grant's work was less hopeless, if less celebrated: the Irish quarters of London are bad enough as it is; if it were not for the Roman Catholic clergy, they would be ten times worse. At the same time it seems as if all that religion and charity do for the drags of our civilisation is in the nature of a palliative, while movements like that of the Rochdale Pioneers (if they reached the lowest) are in the nature of a cure. Still it may be asked, what does this prove? Those who care most for the unseen used to be at the helm, now they are at the pump; it is a leaky ship, and some of them are not too busy to criticise the steering. Patteson was diligent in this department too; and Miss Yonge has taken, perhaps, superfluous pains to exhibit his mind on the questions that arise in connexion with Neander, Colenso, ritual and diocesan synods. He had, of course, little new or important to say; he said it at much length with much earnest-

* The missionaries just released from Coomassie found it easier to teach their pupils Hebrew than Greek—even the Greek of the New Testament.

ness, and with a sobriety that is not without a lesson; though he does not get far into a question, we feel that he has hold upon its real elements so far as he goes; his clumsiness was partly due to a distrust of mere verbal logical completeness upon either side. He thought innovators to blame for not considering how their views would tell upon life; and conservatives, both for putting forward new formulas hard to translate into facts, and for being more ready to overwhelm opponents with theoretical consequences than to appreciate the real conditions of the subject which set their minds in motion.

G. A. SIMCOX.

A History of Crime in England. By Luke Owen Pike, M.A., of Lincoln's Inn, Barrister-at-Law. Vol. I. From the Roman Invasion to the Accession of Henry VII. (London: Smith, Elder & Co., 1873.)

HOWEVER much readers of this volume may be disposed to acquiesce in the author's claim that "what is at least honestly done may be leniently judged," few, we imagine, will carry indulgence so far as to say that the task he has undertaken has been satisfactorily performed. The history of crime is a wide and difficult subject, which cannot be adequately treated without entering upon many social and political questions of the most complicated kind; and it is no disparagement of Mr. Pike's real abilities to say that it demands higher qualities in the historian than he can fairly be credited with. The honesty, indeed, with which he has done his work, is beyond question. His matter has been collected with commendable industry, and is skilfully arranged, while his thorough-going belief in himself and his theories, however much it may have distorted his judgment, imparts a certain vigour and directness to his style. He has done good service, too, by the way in which he has ransacked for purposes of illustration original documents, so little known and in themselves so uninviting, as the Plea, Gaol-delivery, and other similar rolls, preserved in the Public Record Office, the value of which as contemporary evidence can hardly be overrated. But, notwithstanding its merits in other respects, the work is ruined by the author's narrowness of mind and arrogant tone of superiority. The one dominant idea throughout is that the condition of England during the whole of the middle ages was that of unredeemed barbarism and depravity; and the express aim of the volume is to show the "polished gentleman," who may read it, that it is his bounden duty to thank Providence that he is not as his "brutal" forefathers were. In the treatment of his subject Mr. Pike shows neither the impartiality of the judge, nor the delicate skill of the anatomist, such as Macaulay, for instance, has attributed to Hallam. His whole tone is that of the advocate; and his dissecting powers remind us of an operator but too well known to the ages in question. He serves mediæval society much as a mediæval executioner served a traitor, and hangs, draws, and quarters his victim without compunction, as guilty of the most atrocious crimes and worthy of nothing but execration. It may

be made a matter of complaint at the outset that Mr. Pike nowhere gives any definition of crime; for, although the work opens with the pertinent question, "What is crime?" he has omitted to answer it, and we are therefore left in the dark as to the rules and standards by which so many different states of society are to be equitably judged. The fact is, he seems to regard crime as a fixed and absolute term; and it is the modern standard that he unconsciously is inclined to apply to all cases alike. It is this omission to make allowances for differences of condition, of sentiment, and of circumstances that makes his view of mediæval society so conspicuously onesided. What is wrong in one age or country is not necessarily so, or in the same degree, in another. The Roman of the Republic, for example, exposed his newly-born infant with little or no idea of the criminality of his act; and in estimating the degree of his guilt it is obviously unfair to speak of him in the same terms as would be applied to a modern parent in a similar case. Again, Edward the Black Prince showed as great a disregard for human life as Bonaparte himself; but whereas the latter fell beneath, and the former only did not rise above, the contemporary standard of morality, there can be little doubt as to which deserves the greater reprobation. But Mr. Pike is not so discriminating. He says, indeed, that "crimes can never be exhibited in their true light without some knowledge of the surrounding social conditions;" but the last thing he thinks of is to seek in those conditions for explanatory or extenuating causes. On the contrary, he rather inverts the process. Instead of accounting for the prevalence of crime at particular periods by the exceptional state of society, it is from little else but criminal records that he infers what the general state of society was. On the same principle, one might attempt to write the history of modern society by the light of the *Newgate Calendar* and the records of the Divorce Court. That crimes of violence were vastly more common in former times than at present, no one will dispute, and the reasons are too obvious to need recital. Whether the same was the case with respect to crimes of fraud is more doubtful; though the facts brought forward by Mr. Pike are strongly in favour of the affirmative view. But it is one thing to concede all this, and another to expatiate with infinite scorn on the "hideous barbarism" of our ancestors because they had not attained to modern ideas of right and wrong. To examine all the extravagancies into which Mr. Pike is betrayed would be impossible. To go no further than the first chapter, a comparison between the pictures there drawn of Britain under the Romans, and of England down to the Norman conquest, will be sufficient to show the reader how large a part prejudice has had in colouring the work. The contrast could hardly be greater: it is modern England to Ashanti. Yet when the author exclaims, "Happy the provinces in the days of the Roman Empire!" and dwells on the "ferocity of the barbarians" before whom the Empire fell, and who, as far as England is concerned, are represented as *no* better in the eleventh century than in the

fifth, he forgets how much the success of these "Teutonic hordes" was due to the vices and corruption by which every part of the Roman world was incurably affected. Whatever may have been the happiness enjoyed by Romanized Britain (and a fancy sketch drawn from the Theodosian Code and the remains of Roman villas is not very convincing) the ultimate effect of the Imperial rule was not to create a nation but to ruin a people. If Britain owed to Rome its civilization, it owed to her also the extinction of the spirit of independence, and with it the loss of all the manlier virtues; and when the legions were withdrawn, its enervated inhabitants were less able to cope with barbarian foes than their more courageous, and not more disunited, ancestors with the disciplined armies of Rome herself. It is for this vicious and emasculating system that Mr. Pike has nothing but praise; while no words are strong enough to express his contempt for those Teutonic institutions, manners, and laws, which, however repugnant to modern ideas, have made England the most free, if not the most enlightened and powerful, of modern nations. The same tone of exaggeration is more or less observable throughout the volume. Take, for instance, the description of London in the reign of Henry II., a monarch, by the way, not at all likely to put up with habitual licence. Rapine and murder, we are told, "became the favourite pastime of the principal citizens, who would sally forth by night, in bands of a hundred or more, for an attack upon the houses of their neighbours. They killed, without mercy, every man who came in their way, and vied with each other in brutality." The authority for this sweeping charge, which on the face of it would seem to require at least some qualification, is a story told by Benedict Abbas of an attack made upon the house of a citizen by a turbulent mob, or, as Mr. Pike phrases it, "a band of these distinguished murderers and burglars," who were, however, repulsed, and the ring-leaders punished. It is true that Mr. Pike's account is not more strongly worded than that of his original. But is not the original one of those same "meagre" chronicles on which he places so small a value, and may there not be in the present case an instance of "the distortion and exaggeration which are inevitable in the pages of the chronicler"? Mr. Pike, too, somewhat contradicts himself. As the chief culprit was hanged, and as it is of course out of the question that it should have been merely because he deserved hanging, it is suggested that the sum he offered the king for his life was too small, or the scandal too great, to allow of his pardon. But, if the normal state of the city was as Mr. Pike represents it, there could have been no scandal at all; the outrage would have been taken as in the ordinary course of things, and would have attracted even less attention than the playful freaks of an Irish election mob now and then excite among ourselves. It might have been expected that, as Mr. Pike is so merciless in denouncing the crimes of our ancestors, he would have some sympathy, at all events, with the honest, if clumsy, attempts they made to repress them.

This is, however, very far from being the case. Mediæval laws, at least down to the reign of Edward III., are all alike either inveighed against as ferocious, or sneered at and ridiculed for their crudeness and futility. How far the author is capable of seeing beneath the surface of what he unreservedly condemns may be judged from his statement that the real use of a writ for the conservation of the peace, dated in 1233, which others have estimated at its true value as a development of the old Peace Pledge into a complete system of watch and ward, "was only that of handing down to posterity a summary of the inconveniences to which our forefathers were subjected by futile attempts to give a little security to their lives and property." How little security there was for the latter, even in the settled times of Edward III., the author informs us farther on. "The experience of many ages," he says, "had proved that the shortest way to obtain possession of land was to take it; when property of another kind began to increase, similar modes of acquisition at once suggested themselves, and were very commonly adopted." This must mean, if it means anything, that so late as the fourteenth century, the theory of "might is right" was carried out to the fullest extent, that in the ordinary transactions of life it was the rule, and not the exception, for one man simply to appropriate whatever he coveted belonging to another. But if Mr. Pike's theory is to hold good, how does he account for the existence of the thousands upon thousands of deeds in public libraries and private muniment rooms, which record the peaceable transfer of land, in former ages, from party to party, from the highest to the lowest, king, noble, and commoner, in every corner of the kingdom? It appears to us that if there ever was a time when the transfer of landed property was a simple and ordinary matter of business, unclogged by the involved technicalities and lengthy verbiage of modern times, it was in the days of our "brutal and barbarous" ancestors. Mr. Pike, however, is determined to see nothing but lawlessness, violence, and depravity; he appears to admit of no exception to the rule that knights were "brigands," judges shamefully corrupt, and traders "users of false weights, false measures, and false pretences of every kind." Nor is he less hard upon the women, who "were almost as brutal as their husbands and paramours." Even Chaucer's Prioress was no better than she should be; for "it is not without a motive that the poet adorns her with a brooch, and that on the brooch there is a Latin inscription which is, when translated into English, 'Love overcomes all things.'" If this is only an amusing instance of the author's prejudice, an equally amusing instance of his inability to divest himself of nineteenth-century ideas is furnished by his account of the trial for witchcraft of the Duchess of Gloucester in the reign of Henry VI. One charge against this lady was that she had made a waxen image of the King, which she had significantly melted before a fire. Upon this the author remarks:—

"The sense of humour must have been strangely wanting in the august assembly which sat to investigate this charge. Not one of the whole number

seems to have been struck with the incongruity of a king and the most powerful of his spiritual advisers sitting solemnly in a consecrated building, of which the name was famous, to ascertain whether a great lady and a silly woman had or had not—melted a piece of wax."

Surely sense of another kind must be strangely wanting in Mr. Pike, if he finds cause for wonder in the fact that, in an age when witchcraft was not an exploded superstition, but a terrible reality, men failed to see the humorous side of such a trial, which presents itself to his own more enlightened mind. Nor is the work less open to remark on the ground of its faults of omission. To say nothing of the absence of any sustained attempt to trace the causes (apart, that is, from the innate brutality of the people) which made mediæval England such a hotbed of crime, or to show how far it was attributable to foreign and civil wars, the mixture of races, the character of the sovereign and his advisers, the want of an efficient police, and other such influences, some special forms of crime are passed over altogether. Readers of Mr. Lecky's *History of European Morals* will remember the extremely interesting account there given of the changes in public opinion with respect to suicide and infanticide; but they will be grievously disappointed if they turn to this volume in the natural hope of finding further information. To the best of our belief, neither crime is even so much as mentioned; while other crimes, such as those against the Forest Laws, are very insufficiently discussed. It is impossible, therefore, to pass any but an unfavourable judgment on the work. In the endeavour to counteract the influence of modern romance-writers, Mr. Pike falls, as deeply and less excusably, into the same error of which he accuses them, and draws a picture of mediæval society quite as one-sided and unreal. The truth, of course, lies between the two extremes. The men of those days were neither paragons of heroism and virtue, nor, on the other hand, monsters of vice. They had the same passions and feelings as ourselves, though the former were less under control and the latter less refined. And when it is remembered that crime is still so prevalent, and so irrepressible, notwithstanding the immense advantages we enjoy, in a higher civilisation, in the extension of education to all classes, and in a perfectly-organised system for the detection, safe-keeping, and punishment of criminals, it certainly seems no less in accordance with justice than with charity, that some other tone than that of indiscriminate invective should be adopted in dealing with the sins and short-comings of less favoured ages. As far as breadth of view and dispassionate and philosophical treatment are concerned, Mr. Pike's *History of Crime* is a decided failure; but as a vigorous exposition of a particular theory, and still more as a repertory of facts bearing upon the subject, its interest and value are considerable.

A SECOND Manchester Branch of the New Shakspere Society is likely to be formed at Manchester, consisting of professors and students of Owens College.

Swiss Allmends and a Walk to see Them, being a Second Month in Switzerland. By F. Barham Zincke. (London: Smith, Elder & Co., 1874.)

In the present day, when the whole area of Switzerland and the adjacent Alpine region has been *exploité* in every sense, it needs a bold man to write *A Month in Switzerland*; but it may almost be called infatuation to write a *Second Month in Switzerland*. Mr. Barham Zincke is well known as the author of a very interesting little book on the United States and of several other works of travel, which, to judge from the notices of the press, have given much satisfaction to his critics and to the public. It is difficult to believe that the present work will meet with an equally favourable reception. It is, of course, no discredit to a man to have little that is new to say about a very commonplace tour in the Alps; such an excursion is very like a walk along Fleet Street, highly interesting to an intelligent stranger, but when described to a Londoner somewhat lacking in excitement and novelty. It is true Mr. Barham Zincke is in advance of many of his countrymen in one respect: he is aware that the Swiss have a history and institutions worthy of the attention of a rational man, and are not merely a rapacious horde of guides and hotel-keepers; but it was hardly worth while to compel readers who would be interested in an account of the Swiss Allmends to pick their way through the petty details of an insignificant tour. We would not be misunderstood: much of what Mr. Zincke has to say would be interesting enough in private letters to personal friends, though we suspect that some of it would be familiar to those who are accustomed to listen to his sermons; but we may fairly expect a little more substance and matter in a work addressed to the general public, and bearing a title specially calculated to attract the attention of political and historical students. The Allmends, though they furnish the title, hold a very insignificant place in the book; and the chapter which is specially devoted to them reads more like a tyro's essay, written in a tone of complacent optimism, on the history of landed property, than an adequate and scholarly treatment of an intricate subject. Mr. Zincke, like M. Ollivier, approaches a difficult undertaking with a light heart, and his treatment is a fair specimen of the naïve effort which Englishmen so often make to substitute rough and ready observation for laborious and patient inquiry. For instance, Mr. Zincke (p. 174) calls on the President of Glarus, and endeavours, unsuccessfully it would appear, to extract from him an accurate explanation of the Swiss use of the term *Verein* or corporation. It would be too much to expect the mayor of an English provincial town to give an historical account of the corporation over which he presides, but an inquiry addressed to such an official would scarcely be an adequate way of approaching the subject. It is true that Mr. Zincke has access to and partially avails himself of, more complete sources of information; but it was scarcely worth while to gibbet the worthy President of Glarus for failing to solve an intricate historical problem. It may be as well to inform our readers that

an "Allmend" is a tract of commonable land, a survival no doubt of that system of village communities which Sir Henry Maine in England, and Von Maurer, Nasse, and others in Germany, have done so much to illustrate. Of the etymology of the word, Mr. Zincke does not so much as give a hint.

Mr. Zincke appends to his volume a map of Switzerland and the adjacent regions, prepared by Messrs. Keith Johnston, of Edinburgh, which he assures his readers is "a really good map." We are sorry we cannot agree with him. A really good map should be clear and accurate; the one before us is neither. Of course its scale excludes minuteness of detail in the higher Alpine regions, but it is not inconsistent with accuracy of outline; whereas not one of the great snowfields of Mont Blanc, of Monte Rosa, of the Oberland, or of the Bernina, to say nothing of the less known parts of the Pennine chain, is laid down with anything approaching accuracy. We look in vain for Piz Roseg, Piz Morteratsch, the Berglistock, the Rympfischhorn, or the Aiguille Dru, though space is found in the chain of Mont Blanc for indicating the Jardin in letters larger than those used for Chamonix. If it be said that the map is intended for humbler pedestrians, how can we account for the omission of the Piz Languard, the Bella Tola, the Torrenthorn, Mürren, Arolla or the Bel Alp; or for the indication of such well-known high-roads as the Furca and Oberalp passes in the same way as glacier-passes like the Theodule and the Gries, and mule-paths like the Scheidegg, the Gemmi and the Col de Balme? We can only recommend any readers who may be planning a Swiss tour to be content with the humdrum but useful Baedeker, and to carefully avoid the pretentious inaccuracy of Messrs. Zincke and Keith Johnston.

The indiscretions of travellers are proverbial. Mr. Zincke devotes a chapter to an account of a conversation with "a cultivated Italian," whom he met on a steamer on the lake of Brienz; the account given of this gentleman is flattering enough, but the chapter is not in the best of taste. Perhaps the practice of "interviewing" and reporting has not yet penetrated to Italy, and we may hope that Mr. Zincke only learnt it in America; but we should much like to hear that Italian gentleman's account of the aforesaid interview. JAMES R. THURSFIELD.

Year Books of the Reign of King Edward I. Edited and translated by Alfred Horwood, of the Middle Temple, Barrister-at-Law. Published under the direction of the Master of the Rolls. (London, 1863-73.)

THE volumes before us will be "caviare to the general." What care the million about law cases litigated nearly six centuries ago? They refer to a state of society so completely different from our own that to the majority of even educated readers these pages must appear utterly unintelligible. The works published under the direction of the Master of the Rolls are given to the world not in the hope of creating a popular *furor*, but in the trust that here and there a few determined and very diligent students of

history may be found who will search among the heaps of rubbish for a few nuggets of valuable information. It is no disparagement of the learned editor and translator of the *Year Books* to assert that they contain much that is obviously and hopelessly worthless.

The greater part of these volumes is occupied by highly technical statements of pleadings and points of practice with reference to a jurisprudence long since obsolete. It is hardly conceivable that in any contingency they can prove to be valuable, or add to our existing knowledge of the history of the reign of Edward I. On the other hand, it may be readily acknowledged that we find in this laborious work not a few passages which serve to illustrate the state of the law and of society in that reign. It must be remembered that Edward I. is deservedly considered by constitutional writers as the founder of the judicature which has existed, substantially unchanged, to the present time. Of course the Law Courts of the kingdom had their origin before his time, and many of the most important tribunals which he left untouched—notably the County Courts—existed long before the Conquest. Still it may be said, without serious inaccuracy, that the judicature was not systematically established in the form which still exists, until the time of the first Edward. Of all our Kings he was the greatest lawgiver.

If we adopt this view of the character of the king in whose time these *Year Books* were compiled, it certainly becomes a matter of interest to observe how early the proceedings of the courts acquired method and regularity. The cases are argued very much as they would be argued now—the advocates on either side speak alternately, and the judge gives his decision. Although there is seldom any express reference to precedents, still we see from the orderly course of debate, and the reasons assigned by the judges, that law had come to be regarded as a regular science. So far these cases are interesting; but many of them, as it seems to us, were scarcely worth the good paper and print which has been bestowed upon them. What possible value, for example, can we assign to such a case as this, which is reported under the date 1302?—

"Master Walter de Stapilton vouched a foreigner to warranty in the County of Devonshire—BERREWIK. Take a day in banc in the quinzain of S. Hilary and sue out a writ to summon your warrantor. And in the opinion of some he shall have a writ out of the Eyre to the Chancery under the seal of the Chief Justice, and then shall have out of Chancery a writ to the Sheriff of Devonshire to summon his warrantor in Banc."

In common justice to the Editor of the *Year Books* it must be said that this extract is taken, not as a fair sample of the more valuable part of his work, but as a specimen of the abundant chaff with which the true grain is mixed. What should we say of a law publisher who reprinted obsolete books of the practice in the Courts of Chancery or Common Law in the time of Lords Eldon and Ellenborough? The only persons who buy such books now are the dealers in waste paper. It is impossible to suppose that mere points of practice and detail in the litigation of the fourteenth century can have any value now. This consideration raises the question

whether it would not be safe to give the editor of such a work as the present a discretionary power of omitting parts which are manifestly useless. Fully acknowledging the value of the volumes printed with the sanction of the Master of the Rolls, and those published previously by the Record Commission, we cannot help thinking that the enormous labour bestowed upon them might in some instances have been more profitably directed. To take a very striking instance—the most valuable work in the whole series is incontestably the magnificent collection of Parliamentary Writs edited by Sir Francis Palgrave. With respect to this work it was observed by Sir Harris Nicolas that "the editor of the Parliamentary Writs has executed his task in a satisfactory and able manner, with one exception, that of not commencing the series with the earliest writs upon record," and he considered the work of Sir Francis Palgrave the only well-edited volumes published by the Commission. Unfortunately the collection comprises only the reigns of Edward I. and II. It is greatly to be deplored that the work has been discontinued. The appendices to the "Report on the Dignity of a Peer" contain Parliamentary Writs from Edward III. to Edward IV., but the series is very incomplete, and certainly is not edited in such a way as to be available to the student. These writs of summons to Parliament, and those earlier writs to which Sir Harris Nicolas adverted, would, if they were properly edited, be invaluable as materials for the history of the British Constitution. Can it be for a moment contended that the memorials of litigation between obscure private persons five hundred years ago, or the chronicles written by credulous and often mendacious monks, are to be compared in value with the solemn instruments issued by the Kings of England in the exercise of their most important function—the convocation of the Supreme Legislature? We wish to speak with all due respect of the long series of *Chronicles and Memorials of Great Britain and Ireland*, which now present such a formidable array in our public libraries. But in looking over the catalogue of these works it is impossible to avoid the conclusion that the incessant multiplication of such works, while the Parliamentary Writs continue neglected, bespeaks a strange tendency to prefer that which is often trivial and always unauthentic to documents which are all of the highest authority and moment.

One of the regulations under which the Rolls' series is published requires that the editor of each work "should give an account of the MSS. employed by him, of their age and their peculiarities; that he should add to the work a brief account of the life and times of the author, and any remarks necessary to explain the chronology; but no other note or comment was to be allowed, except what might be necessary to establish the correctness of the text." The wisdom of the latter restriction is open to grave doubt. In the noble edition of Parliamentary Writs the learned editor has added foot-notes which are of immense value to the student. The references to contemporaneous events, and the judicious quotations of ancient chronicles and records very often render clear

the purpose of a writ which would otherwise be unintelligible to the majority of readers. Why should not a similar course be adopted with respect to such a work as a collection of law cases of the fourteenth century? The editor, Mr. Horwood, has given sufficient proof of his ability to elucidate the text; but, as it stands without note or comment, it is for the most part a sealed book. A large number of the cases refer to the tenure of land; that is, to laws utterly unlike anything we have now. In order to show the interest with which many of these obscure reports might be invested, and in order to give a fair specimen of the present work, let us revert briefly to some of the tenures of the time of Edward I.

The most important were undoubtedly these three—knight-service, free socage, and villan tenure. The theory of knight-service was that the holder of the land enjoyed it on condition of rendering certain military services to his superior lord, such as accompanying him to war when required. Thence it followed that if the owner were a minor the lord was entitled to be his guardian, for the law supposed the heir unable to perform knight-service till he attained the age of twenty-one, and the wardship and custody of his lands was retained by the lord that out of the profits he might provide a fit person to supply the infant's place. This convenient fiction enabled the great nobles to plunder their infant wards cruelly, and as Sir Thomas Smith, quoted by Blackstone, says, the heir "came to his own after he was out of wardship, his woods decayed, houses fallen down, stock wasted and gone, lands let forth and ploughed to be barren." Knight-service was a tenure of the most gentlemanly and expensive sort. On the other hand, free socage, the second of the tenures which we mentioned, pertained rather to the middle classes. It was almost identical with modern freehold, except that the holder paid certain fixed rents, generally of a very moderate amount. "Socage" is derived by Spelman in his Glossary from the Saxon "Soen," i.e. *libertas, franchesia*. The etymology suffices to show that socage was more ancient than knight-service. The tenant in free socage was exempt from the oppressive burdens of the military tenure; and the lord could not seize the profits of his lands and take them to himself without rendering an account.

The following case given in the volume published in 1863, at page 106, illustrates the eagerness with which the privileges of wardship were asserted. Henry de Bodrengam complained by bill that Thomas le Arcedeckne tortiously and against the peace of our lord the King, came at a certain day and assailed him, and took away William, son and heir of B., who was in his wardship. A jury was summoned. The presiding judge was Brumpton:—

"The *Inquest* said that Sir Ralph de Bloyon on the same day as that complained of by Henry le Bodrengam came to the inn of Thomas le Arcedeckne, and there they had a long conversation, and afterwards Sir Ralph and Thomas and their followers went to the house of William Beyon, where Sir Henry was. Sir Rauf entered together with all the others except Thomas, who did not enter, and requested Henry that he would deliver up to them an infant who was in ward to him; but Henry

would not do so. Strife arose between them, and Henry was beaten and wounded, as he complains of having been. BRUMPTON.—What right had Sir Henry to the wardship? The *Inquest*.—None save the wardship of the infant by virtue of his mother having delivered him [to Henry] in consequence of a disagreement between Sir Ralph and the mother. BRUMPTON.—After the fact, where did they go? The *Inquest*.—To the house of Thomas, where the infant remained full three days afterwards. . . . BRUMPTON.—Go on now to the damages, and tell us if they carried away any goods or armour. The *Inquest*.—They did not carry away any chattels; but we assess his damages at one hundred marks."

The Court adjudged that Henry should recover his damages assessed at one hundred marks, and that Sir Thomas should go to prison. In another case given at page 90, one question was whether land was held by knight-service or in socage; if by the former, the lord was not bound to render any account of profits which he had received of any infant's land during his minority. But if the land were held in socage, the lord would be bound to render the account. The advocates on either side are King and Lanfar. The judges are Brumpton and Berrewik.

"A writ of account in socage, where the account was demanded for three manors; it was replied by KING.—As to one manor, we say that he ought not to be answered, for it is held in knight service; judgment, &c. BERREWIK.—Of whom is it holden by knight service? KING.—Of Robert de C., who granted the wardship to us for so long as this John who brings the writ should be under age. LANFAR.—Our ancestor died seised of these tenements; and you, after his death, seized the wardship as nearest relative to whom the wardship of the lands holden in socage belongs; judgment, &c. BRUMPTON.—Does not your writ state that the tenements are holden in socage? If you wish to maintain the action, you must support the writ. Adam tells you that the tenements are holden by knight service; what say you? LANFAR.—In socage. And the other side said the contrary. . . . The *Inquest* said that the first manor whereof he demanded the wardship was holden in socage, and that he had the wardship of that manor for ten years; and as to the second manor, that his father had granted it for term of life; and as to the third, that he had the wardship for two years. BRUMPTON.—Therefore the Court awards that he render an account, and that he be in mercy because he had refused to account; and he appointed auditors to settle the accounts."

The case is instructive not merely as an illustration of ancient tenures and the social condition of the tenants, but also as evidence of the regularity of law proceedings. One matter rather remarkable is the employment by the Common Law Courts of processes which afterwards were almost exclusively confined to the Court of Chancery. Here the justices in Eyre direct accounts to be taken, and appoint auditors for the purpose.

With regard to the third of the tenures which we have mentioned—that of villans, there is not much information in the present work. It is clear, however, from other sources that the *villani* in the reign of Edward I. for the most part held their lands by fixed tenure, and were not abject slaves liable to be dispossessed at the caprice of their lords. The "Hundred Rolls," and many other records still extant, give abundance of evidence as to the services exacted. They were such as ploughing and reaping

for a certain number of days in the year; or the render of a fixed amount of farm produce. Subject to these obligations, the *villanus* was secure in his holding. It is impossible to examine the Hundred Rolls and come to any other conclusion. In the work before us we find a case in which a defendant voluntarily pleads that he is a villan.

"One A brought a writ against one W, and W said that he was a vilen of the prior of N; wherefore the writ abated. Afterwards A brought another writ against W and the prior."

Clearly A would not have brought the second writ against W unless he had considered him a responsible person, notwithstanding his condition as a villan. An important distinction was made in another case between enfranchisement of the blood—i.e., the person of the villan, and enfranchisement of his land. At page 138 of the volume published in 1863 we find the following instructive argument:—

"*Iunt*.—Where the blood is once enfranchised by him who has power in that behalf, although the person enfranchised should afterwards do customary services, yet that does not enslave the blood. And *Kyng* added, Once enfranchised he shall be for ever free, if he be not afterwards enslaved by his own act in some Court of Record."

The cases to which we have referred will give some idea of the general character of Mr. Horwood's work. But the contents are so miscellaneous that it would be quite impossible within our present limits to present a complete account of them. Mr. Horwood's translation is generally very felicitous. The Norman-French of the original has been rendered with spirit and accuracy; and the few illustrations which the editor has given in his preface show such a familiarity with the antiquities of law as to excite a wish that the text were abridged and the commentary extended.

HOMERSHAM COX.

Drill Regulations of the Austrian Cavalry.

From an Abridged Edition compiled by Captain Illia Wornovits, of the General Staff, on the Tactical Regulations of the Austrian Army, and prefaced by a General Sketch of the Organisation, &c., of the Country. Translated by Captain W. S. Cooke. (London: Henry S. King & Co., 1874.)

IN no other manner is the vastly increased interest now displayed by the officers of our army in the study of their profession, more satisfactorily evinced, than by the number of military works which have recently been produced by the pens of those who wear the sword. The Franco-German war, beside which the previous yet recent campaigns in Bohemia, Italy, and the Crimea, pale into obscurity, has alone absorbed the attention of military critics until now, and the theme is hardly yet exhausted. The tide naturally set into German channels. The admiration accorded to success turned all eyes on the Prussian military organisation, with which perhaps many are better acquainted than with our own, and certainly than with that of any other country. We therefore receive with pleasure a new volume which diverges from the general course, and brings us back to the once far-famed Austrian cavalry.

Captain Cooke, of the 22nd Regiment, has published a translation of the *Austrian Cavalry Exercises*, prefaced by a sketch of the organisation, &c., of that arm in Austria. The preface, unlike that of many books, is the most interesting part.

War wrecks many great reputations, and in the campaign of 1866 that of the Austrian cavalry was no exception. Though brave, smart, and well drilled, they proved to be deficient in *morale* and in training for field-service; the outpost and reconnaissance services were in general defective—the surprise of the defile of Nachod—the neglect of pursuit after Trautenau—the interrupted retreat at Soor—and the ignorance of the Crown Prince's advance at Königgratz—were all shortcomings mainly attributable to a faulty appreciation of the proper rôle of cavalry in the field.

The Austrian government were quick to recognise the deficiencies of their military organisation, and alterations were commenced immediately after the war. The Cuirassiers, who had been deprived of their cuirasses in 1860, but still bore the name, were placed on the same footing with all the other cavalry in 1866. This total abolition of heavy cavalry, probably due to some repulses which they underwent during the campaign, seems to be a step of very questionable advantage. The total peace and war establishment of the cavalry was very largely increased under the new organisation of 1869. The combatant war establishment was raised from 29,000 to 49,000 sabres, while in peace 37,000 horses are now maintained in lieu of 32,500. The field as well as the peace strength of a cavalry regiment is now six squadrons of 150 sabres, in lieu of the former generally prevailing five squadrons. On mobilisation a *depôt* squadron and a reserve squadron of the same strength are formed; the horses being procured by a system of classification in peace, which England would do well to imitate.

The Austrian cavalry labours under three great difficulties as regards training. First, the diverse nationalities and languages of the recruits, involving want of homogeneity and sympathy, and necessitating the employment of a technical dialect of German for military purposes, besides imposing on the officers and non-commissioned officers a compulsory acquaintance with at least one language besides their own. Secondly, the dispersion in small detachments in billets of the greater number of the regiments, who are thus deprived of the advantages of barracks, riding schools, and drill grounds, as well as of the opportunity of manoeuvring and drilling in large bodies. Thirdly, the three-year period of service, which, frittered away as much of it now is by bad weather, movements, and other interruptions, proves hardly sufficient for the complete education of the cavalry soldier. The first difficulty is inevitable; the second is being remedied; and an attempt is being made to induce trained soldiers to remain, by the inducements of prospective Government appointments and pensions.

All the cavalry is now armed with breech-loading carbines. This question of armament was practically decided by the German troopers, who, during the war in France,

provided themselves with chassepots captured from French infantry. The kit of the Austrian cavalry is lighter than ours, the heavier garments being carried in squadron baggage-waggons; notwithstanding this, the average weight carried is slightly greater than in our service, being in the field, with rations, over twenty stone.

Captain Cooke points out that a very noticeable detail in the cavalry organisation is the pioneer training; a section of each regiment being trained and equipped with tools for the duties of destroying and repairing railroads, &c. In this respect we are still in arrear, though much has been done by individual exertion.

The qualifications now required from officers of Austrian cavalry are high, and the duties exacted from them severe. As the standard of efficiency has been raised, so has the number of aspirants declined, and some difficulty is now experienced in obtaining officers. Subalterns are allowed government chargers, and facilities are afforded to officers for purchasing horses by instalments at a cheap rate.

The drill regulations are simple, and on the non-pivot system. It is perhaps to be regretted that Captain Cooke did not, as far as possible, make use of our nomenclature in his translation. The squadrons are told off in four "sections" corresponding to our "divisions," each being led by an officer, the squadron commander taking post in front of them. The single officer in rear takes the place of the "squadron-sergeant." In turning, our system of "fours" is employed. In other column movements, the Austrian "fours" correspond to our "sections," their "twos" to our "half sections." The squadron being divided into four parts, there is no unit analogous to our "troop," except the front of a double column of "sections." "Divisions" being half a regiment, or three squadrons, correspond so far with our "wings." The drill in detail is similar to ours, but the movements are neither so numerous nor so complex.

In these Regulations, however, there are conspicuous omissions. With the exception of patrols, the most usual and the most important duties of cavalry in the field, viz., outpost duty, reconnaissances, advanced and rear guards, foraging, and, in short, the operations of *la petite guerre*, which now mainly devolve upon the cavalry, are not even touched upon. It is true that the German works on these subjects supply the want to those who seek the information; but efficiency in these duties is even more material than excellency in manoeuvring; it may with reasonable reproach be said—"These things ought ye to have done; and yet, not have left the others undone." Our own Regulations, incomplete as they are, surpass the Austrian Drill Book in these respects; and remembering that they are supplemented by Captain Frank Russell's translation of Von Mirus, Captain J. C. Russell's *Notes on Cavalry Service*, Nolan's book, General Smith's *Cavalry Manoeuvres*, Baker, and other original or translated works, we may avow with pride that the British cavalry officers have shown themselves to be fully alive to the changes of modern warfare, and anxious to maintain

the high reputation which their arm of the service has always enjoyed.

Captain Cooke's contribution to this section of literature will be welcomed by all military students. The original matter is concise, clear, and valuable; and the translation is facile though literal, and illustrated where necessary by diagrams.

J. C. ARDAGH.

MINOR LITERATURE.

The Place of the Physician. Being the Introductory Lecture at Guy's Hospital. October, 1873. With other Essays. By James Hinton. (King & Co., 1874). The sciences are so many hands stretched out to strengthen the weakness and supply the wants of men. The physician's task is "like shaking hands with Briareus," and Mr. Hinton's lecture is an eloquent exhortation to the medical students at Guy's not to be alarmed at the boundless prospect before them, but to profit by the multiplicity of points of contact between their professional studies and every other form of human action or research to repay to all the assistance that all can afford them. The leading idea of the *brochure* is the parallelism between the organic life of man and the larger life which, it is suggested, may only seem to differ generically from our own, because its manifestations are on too vast a scale to be grouped into a whole by our comprehension. Some of the author's illustrations are original and apt, as when he compares the exploded practice of blood-letting (which served its immediate purpose at the expense of a more injurious reaction) to the legislation which "rushes to meet every evil with some mechanic remedy," forgetting the "untold reactions of the living frame" of the social organism. The lecture is supplemented by two short essays, one on the relation between the organic and inorganic worlds, developing the notion that the distinction between living and inorganic forces may prove to be as unfounded as that drawn by the ancients between the continuous motions of the heavenly bodies and the motion on earth, that seems to begin and end in our sight. The other essay is also short, but weighty, on that mode of advancing knowledge which consists in the *reductio ad absurdum*, or "correction of the premisses," and the difficulty, almost more moral than intellectual, of giving up an opinion which it was right and reasonable to hold so long as the mistaken premiss was uncorrected. The power of right reasoning is shown by the reluctance of the mind to abandon what it has once felt to be true, and the same cause which gives error its tenacity, assures the final triumph of its correction; similarly, in the evolution of morality, the *process* of determining what is right remains the same, though the introduction of fresh premisses, dispelling the moral ignorance or insensibility which is the starting point, may necessitate from time to time a more or less painful reconstruction of detailed conclusions. As the author observes, these considerations are more generally admitted than fairly applied with all their consequences.

EDITOR.

NOTES AND NEWS.

WE understand that the delay in Mr. George Smith's return to England is due to a misunderstanding with the authorities at Mosul. He is bringing back some 3,000 fragments of tablets, and seems pretty well satisfied with the results he has obtained, though they do no more than complete the inscriptions already in the possession of the British Museum.

A CATALOGUE of the library of the late Dr. Brandis, private secretary to the German Empress, whose Life we reviewed lately, has been issued by the firm of Stargardt at Berlin.

WE have great pleasure in calling the attention of our readers to a contribution to our knowledge of Milton on the part of the Rev. A. B. Grosart. He has already given us a finely-executed portrait of Spenser, after the original in the possession of the Countess of Chesterfield, and he now promises us a copy of the portrait of Milton by William Faithorne, 1670. Professor Masson writes to Mr. Grosart of this portrait:—

"There needeth be no hesitation as to which is the authoritative portrait of Milton, for there is only one of him of any authority—that is, in his age. The engraving of Faithorne originally prefixed to the *History of Britain* (1670) is a grand face, nothing that I know comparable with it; and you will make us all your debtors if you reproduce it like your very fine Spenser."

The size of the reproduction will be over 14 in. by 11 in., and the price of the ordinary prints will be a guinea and a half.

FROM Rotterdam we learn that a young lady, Miss Jacobs, of Sappemeer, has passed the examination for a medical degree with the greatest success. She is the first lady who has achieved the distinction in Holland.

A HITHERTO unknown original edition of the Fourth Book of Rabelais has been discovered by M. Edwin Tross at Paris, which bears the title "*Le Quart Livre des Faictz et Dictz Héroïques du noble Pantagruel*, composé par M. François Rabelais, Docteur en Médecine et Calloier des Iles Hières. A Lyon, L'an mil cinq cens quarante huit, in-16, 48 feuillets non chiffrés." This edition, which has not been quoted by any bibliographer, contains only one prologue and eleven chapters, whilst the edition of 1552 has, besides a longer prologue, a dedication to Cardinal Odet de Chastillon, and consists of sixty-six chapters. The introduction differs, moreover, from that in the other editions, and the text is not the same. The volume was discovered by M. Tross bound up with a copy of the Valence edition of Rabelais (1547), in three parts.

A GRAND literary fête is being organised in the department of Vaucluse, for the celebration of the fifth centenary of the poet Petrarch, who died on July 18, 1374. The fête will take place, under the patronage of the authorities, at the fountain of Vaucluse, on July 18 and 19 next.

PROFESSOR CRECELIUS, of Elberfeld, has succeeded in exhuming from the dust of a long-forgotten and extinct local country annual, a number of songs by Arndt, which are not to be found in any of the recent editions of his works. From these compositions it appears that Arndt's connexion with the Rhineland dates as far back as 1790, and not merely to 1814, as has generally been assumed. The various numbers of the annual in which these hitherto neglected songs of Arndt first appeared fall within the years 1798 and 1806, during which period he seems to have annually contributed two or three poems to its pages. It is proposed that the twenty-eight songs which have thus been unexpectedly again brought to light should be incorporated with the latest edition of the great poet's works. Curiously enough, the same old annual which has yielded up this treasure has also been found to contain in the number for 1806 six epigrams by Schleiermacher, which are not to be met with in any collection of his writings.

THE Emperor of China has commanded a collection of Chinese poems from the earliest times to be made. The collection will be published in 200 volumes. The Emperor, it is said, possesses a library of more than 400,000 volumes.

MR. RUSKIN has fallen foul of one of our contemporaries in the last number of *Fors Clavigera*. In the following passage he seems to us to have laid his finger on the root of the disease which is dissolving modern society:—"It is quite possible for the simplest workman or labourer for whom

I write to understand what the feelings of a gentleman are, and share them, if he will; but the crisis and horror of this present time are that its desire of money, and the fulness of luxury dishonestly attainable by common persons are gradually making churls of all men; and the nobler passions are not merely disbelieved, but even the conception of them seems ludicrous to the ordinary churl mind; so that, to take only so poor an instance of them as my own life—because I have passed it in almsgiving, not in fortune-hunting; because I have laboured always for the honour of others, not my own, and have chosen rather to make men look to Turner and Luini than to form or exhibit the skill of my own hand; because I have lowered my rent, and assured the comfortable lives of my poor tenants, instead of taking from them all I could force for the roofs they needed; because I love a wood walk better than a London street, and would rather watch a sea-gull fly than shoot it, and rather hear a thrush sing than eat it; finally, because I never disobeyed my mother, because I have honoured all women with solemn worship, and have been kind even to the unthankful and the evil; therefore the hacks of English art and literature wag their heads at me, and the poor wretch who pawns the dirty linen of his soul daily for a bottle of sour wine and a cigar, talks of the 'effeminate sentimentality of Ruskin.'

It is to be hoped that the recent appointment of Professor Lepsius to the post of Head Librarian of the Royal Library at Berlin will have the effect of bringing to maturity the project—long under the consideration of the Government—of erecting a new library-building, more in harmony with the existing requirements of the city than the square box-like edifice constructed under Frederick the Great, and dignified with the inadequately fulfilled motto "Nutrimentum Spiritus." An observatory is, we learn, to be erected at Potsdam, and is to be specially adapted to the observation of the sun, and of spectrum phenomena generally. Nor is this the only evidence of the strong interest in scientific enquiry which is at present actuating the German authorities, for three distinct laboratories for Physics, Physiology, and Pharmacology, are also being constructed at Potsdam, under the careful superintendence of Herr Spieker, who has likewise had the works of the new observatory placed under his direction. The Society of Artists at Berlin, not to be outdone by their scientific brethren, are bestirring themselves to raise a fund of 50,000 thalers, for the purpose of erecting a suitable academy, with the necessary exhibition halls, studios, and lecture rooms.

A WORK has lately appeared at Vienna, by G. Wolf, which gives an interesting account of Grillparzer in his character, not as a writer, but as a member of the Austrian Civil Service, cramped in his social and official relations, and smarting under the restraints of bureaucratic etiquette and routine. These revelations of his official life throw considerable light upon the sources of that bitterness of spirit and sense of injustice which are so often manifested in his writings, but they at the same time show how thoroughly he had mastered all the details of his work from the most complicated problems of finance to the most trivial regulations of precedent.

A GERMAN translation of Luis da Camoens' *Canzonzen* (Paderborn: Schöningh, 1874), from the pen of Wilhelm Storek, already well-known for the success with which he has clothed foreign poetry in German verse, has just appeared in Paderborn, and is well spoken of for the easy flow of the versification, and the accuracy of the rendering. The *Canzonets* are prefaced by some well-digested preliminary remarks on their form, date, and origin, which thus supply the reader with much interesting matter in reference to the life and character of the author.

In an eloquent and enthusiastic article in the *Nuova Antologia*, Signor G. B. Giuliani advocates the importance of the study of Dante's *Convito* not only for those who wish to understand the *Divina Commedia*, but also for all students of philosophy. He complains that the work has never met with sufficient attention. At first it was looked upon as a novelty, and awoke no interest, because the philosophers of Dante's time resented the application of the vulgar tongue to such lofty subjects. Hence, manuscripts of the *Convito* were in little demand, they were copied by careless copyists, and became hopelessly corrupt. For this cause, when Italian philosophy revived, the *Convito* was neglected as unintelligible, and the same reason has obscured its value in more modern times. In addition to this, however, the *Convito* has been thrown into the shade by the *Divina Commedia*, and is generally interpreted in accordance with preconceived ideas of the meaning of the poem. Signor Giuliani claims for the work serious attention on its own account. Not only is it full of interest as being the foundation of Italian philosophical prose, but also it marks a great epoch in the history of modern philosophy. In Dante's hands philosophy again began to be a motive for the conduct of peoples and states; like a new Socrates, Dante recalled philosophy to matters of human life and conduct, and "Philosophy, so long compelled to show herself in uncouth and unseemly guise, now again, at this first revival of human civilisation, appears in noble apparel in the person of a gentle lady, glorious in freedom, wondrous in knowledge, adorned with honourableness and full of sweetness."

This high estimate of the *Convito* Signor Giuliani promises to justify by a new edition of the text of the work, to which he has devoted many years of study. The text, he says, cannot be restored merely by collating the MSS., which are all corrupt; the task of editor requires knowledge of the history of the time, entire familiarity with Dante's other writings, and an absence of any desire to establish any theory of Dante interpretation. Certainly, the instances he gives of errors in the MSS. would account for any obscurity attaching to a philosophical work: "semenza" is read for "sentenza," "uomini" for "alimenti," "apparenza" for "appetenza;" and many others. We shall look forward with great interest to Signor Giuliani's edition: his account of his method promises well for a careful work undertaken with thorough enthusiasm.

FROM the *Statistics of Queensland* for 1872, lately published, it appears that there are sixteen libraries and reading-rooms in the colony, and that, on December 31, there were 20,800 volumes in these libraries. The private subscriptions, contributions, &c., for the whole number of institutions amounted to 2,052*l.* 15*s.* 10*d.*, and the government aid for the same to 1,671*l.* 4*s.* 2*d.* The government aid for the years previous to 1872 amounted to a total of 11,805*l.* 13*s.* 1*d.*, and the private subscriptions to 11,030*l.* 2*s.* 4*d.*

MR. FITZJAMES STEPHEN'S second article in the *Contemporary* on "Caesarism and Ultramontanism," including his reply to Archbishop Manning, is more interesting if less ingenious than his first. He certainly makes out his main point, that the evidence on which Churchmen rest the claims to which they expect statesmen to defer is very far short of demonstration. On the other hand, the only scrap of argument he advances in support of the assumption that the majority of common people ought to be subject, not only for wrath but for conscience, sake, to a government which balks their inclinations as all European governments do at many points, is an appeal to what he takes for a notorious fact, that leading statesmen now are abler than leading churchmen, and take wider and fairer views of things. This was quite as true in the age of the Antonines as now, and then as now proves nothing. Of course the exclusive way in which Mr. Stephen insists upon

"evidence," is rather *arrivè* now that Dr. Carpenter has shown how much the conscious life, in which alone evidence is weighed, is determined by the unconscious, and Professors Bain and Clifford have arrived independently at a recognition of the inextricable connexion between belief and will, which Dr. Newman has been proclaiming so long to deaf ears. Apart from these general considerations, the controversy leaves the impression that a steadfast, intelligent grasp on a coherent positive doctrine is an advantage which may neutralise much superiority in intellectual versatility, vigour, and precision.

MR. GLADSTONE'S Preface to the Reply of Achilles, in the same number, consists of a captious, though not ungenerous criticism of Pope, some theological remarks tending to show that it was once a virtue to be moderately revengeful, and a masterly rhetorical analysis of the reply. The version is clever, close, and detestably wooden.

THE *Contemporary* also contains a long, careful, and well-written article on Mr. Browning's poetry by A. Orr. Not much fresh light is thrown upon the question of his "place in literature," which the title promises to discuss; but those to whom his writings seem at once to require an interpreter and to admit of interpretation, will find welcome and valuable guidance, the more so, perhaps, that Mrs. Orr has not been unduly anxious to class her author, or to find a single formula to characterise a genius of which the most marked characteristic is a shifting many-sidedness. Many of the single remarks are acute. We hear less of Mr. Browning's obscurity now than formerly, but there can be little doubt that when the charge was most popular it owed its force to the ease with which ordinary readers "mistake a strain on the attention for a strain on the understanding." The effect of the faults of style, which even admirers recognise and yet half enjoy, is well described as stimulating the reader's mind, "lashing it up to its task with the exhilarating energy of a March wind, but the sense of being driven against an obstacle generally remains. We have the wind in our teeth."

MR. BRYCE'S "Impressions of Iceland" is by far the most interesting paper in the current number of the *Cornhill*. He has undertaken the difficult task of conveying to his readers, by description of the strange scenery of Iceland, an idea not only of the country itself, but of the effect which it would be likely to produce upon themselves. The verdict of actual tourists is divided, and Mr. Bryce's skilful and graphic touches will not convince everyone of the charms of Icelandic travel; they only enable those to whom such charms as it possesses naturally appeal to judge of the kind and degree of pleasure to be expected from it. There is little grandeur of form, little or no richness and beauty of colour in the scenery, hardly any striking effects that could be thought to compensate for the hardships of the long rides over stony uninhabited deserts; but, on the other hand, the desert itself—with its bareness, its black hills, yellow marshes, arctic sky, and sublimely complete desolation and stillness—offers what may be called a sensational attraction of its own to travellers who are content to spend whole fatiguing days in taking in the absolutely strange, if weirdly monotonous impression. The account of the natives, though put forward with diffidence as the uncertain result of only two months' observation, looks very much like truth. It is the picture of a stationary society, with no crime, little poverty, little industry, no curiosity, good temper, independence, and an amount of refinement out of all proportion to the barbaric simplicity of all the material conditions of life, clearly due, according to the writer, to the still living enthusiasm of the Icelanders for their ancient literature, which serves at least to keep its memory fresh.

IN the *Fortnightly Review*, Mrs. Garrett-Ander-

son replies to Dr. Maudsley's paper on "Sex in Mind and Education," and, after briefly pointing out the crudeness of the physiological reasoning upon which it was based, explains in a way calculated to reassure all sincere friends of the higher education of women, what are the subjects proposed by its leading advocates in this country, and the means on which they rely. She speaks with authority on the evil of early marriages, the physical effects of simple *ennui*, and the relief to be expected from a change which led to girls of eighteen prolonging their studies to the age at which they would be able to pass the existing University degree examinations. As to the ability of studious young women "to contend on equal terms with men for the goal of man's ambition," Mrs. Anderson declines to theorize, but she points out that at present the inequality of the contention is mainly the work of those philanthropists who are most zealous in maintaining the importance of protection for the weak. The ladies studying medicine at Edinburgh, for instance, had their mental and physical energies tested by a constant and powerful opposition to their right to study at all, in addition to the ordinary work of their contemporaries, and though we are glad to be assured that their strength was equal to the occasion, it is obvious that there will be some girls able to profit by a University course, whose health, nevertheless, would not enable them to do so unless they were allowed to pursue it in peace.

At the meeting of the Camden Society, held on May 2, the report of the Council was read. The books announced for the present year will probably be:—

1. *Account of the Executors of Richard, Bishop of London 1303, and of the Executors of Thomas Bishop of Exeter 1310.* Edited by the late Archdeacon Hale and the Rev. H. T. Ellacombe.
2. *Papers relating to the Quarrel between Oliver Cromwell and the Earl of Manchester.* Edited by the late John Bruce.
3. The seventh volume of the *Camden Miscellany*, containing, amongst other matters: 1. The Accounts of the Building of the Church of Bodmin. Edited by the Rev. J. Wilkinson. 2. Papers relating to the sentence upon Prynne. Edited by the late John Bruce. 3. Sermons of the Boy Bishop. Edited by the late J. G. Nichols and Dr. Rimbault.

The report proceeds as follows: "The Council have thought that they would best meet the wishes of the Society by placing in the hands of members books which have occupied the thoughts of those who have laboured so much for their interests as Mr. Bruce, Mr. Nichols, and Archdeacon Hale. The Chronicle of England from Lord Henry Percy's MS. will thus be unavoidably postponed for another year. It may, however, be satisfactory to the Society to know that time has not been lost, and that the result of Mr. Hamilton's investigations has been to show that the Chronicle is not a mere abridgement of Stow, but the original from which Stow derived a great part of his information, and that it is even more valuable as giving the impression made upon an ordinary citizen by passing occurrences in the reigns of Henry VIII., Edward VI., and Mary, than from its narrative of events."

It is announced that Dr. Röhricht, who two years ago published an interesting treatise on the Crusade (1228-1229) in which the Emperor Frederick II. took part, is preparing a more comprehensive work on the subject of the Crusades generally. Dr. Röhricht's intimate acquaintance with Arabic literature enables him to consult all the Mohammedan as well as Christian sources from which our knowledge of those times is derived, and hence few men could be better qualified than himself for the task which he has undertaken.

In an article in the *Athenaeum* of May 2, a writer reviewing Mr. Hamilton's last volume of

the *Calendar of Domestic State Papers*, gives, under the somewhat sensational heading of "The Armada of 1639," an interesting account of the panic produced in England by the arrival of a large Spanish fleet in the Downs in the autumn of 1639. He seems, however, to be unaware that this panic was totally without foundation, and that so far from the commander, Oquendo, having any design of helping Charles I. against his own subjects, he, having been driven by Van Tromp to take refuge in the Downs, was, through the Spanish Ambassador, Cardenas, pleading with Charles to join him against the Dutch and the French, and offering the restoration of the Palatinate to his nephew as a bribe. Richelieu, however, knew how to countermine the Spanish diplomacy, and amused Charles with a negotiation till the Dutch were ready to strike in and to attack the Spanish fleet even under the protection of the English neutrality. Charles, who was unable to get it by arrangement with one or other of the belligerents, fell between two stools. With this explanation we can recommend the article to our readers, so far as it relates to the effect produced in England by the arrival of the fleet. But it is only fair to Charles I. to remark, that even if the charge against him of seeking to overawe England by a regiment of German cavalry, in 1628, were founded on certain evidence, instead of being a mere conjecture, it is decidedly not true that he was then scheming "to array against his unarmed subjects a troop of foreigners and Papists." The men in question were levied in North Germany, where Papists were not usually found. Their commander, Dulbier, had been in Mansfeld's service, and he passed over with these very men into the service of Gustavus Adolphus, who was decidedly unlikely to admit Papists into his army. It is not necessary to be an admirer of Charles I. to protest against the habit which has received the countenance of some of the greatest names in historical literature, of believing that every rumour spread by ignorant and misinformed persons against him is indubitably true, because it is in print.

We are promised from America an important contribution to the history of Socialism. Mr. Charles Nordhoff has, it is announced, a work in preparation which will give a detailed account of the existing Communistic societies in the United States, with an accurate report of their origin and history, their religious creeds and practices, their industrial and social organisations, their literature, and their present numbers and condition. The book will be the result of a close personal examination.

ANOTHER jubilee is announced at Berlin for the coming summer, in honour, not of an individual, but an institution, being the commemoration of the third centenary of the "Gymnasium of the Grey Cloisters," the most ancient of the high-schools in the Prussian capital, which is now under the able directorship of Professor Bonitz, the well-known Aristotelean scholar. On this occasion also, a volume of the *Collective Papers and Addresses* will be published, the cost of which will be defrayed by the municipality of Berlin, in consideration of the national interest attaching to a publication which in the reports of the various teachers of the institution will supply an interesting summary of the actual position of different branches of knowledge at the present day.

A QUARTER of a century has passed since Professor Georg Waitz, of Göttingen, inaugurated that course of academic teaching which has exercised so important an influence on historical research in Germany. No German university teacher perhaps can boast of having trained so large a number of distinguished scholars as Professor Waitz, and amongst the numerous names which have stood on his list of students, we need only instance those of Professors Usinger at Kiel, Winkelmann at Heidelberg, Stern at Bern, Steindorf and Frausdorff at Göttingen. Besides those of his pupils who

occupy academic chairs, there is scarcely a German gymnasium of any standing that does not number amongst its teachers competent historians who have owed more or less of their training to Professor Waitz. There can be no doubt, therefore, that the jubilee which is this year to commemorate the twenty-fifth anniversary of his tenure of his chair will be numerously attended, and will collect together sympathising friends and pupils from every part of Germany. The committee appointed to superintend the necessary arrangements have announced that the celebration will be held at Göttingen towards the end of August, and that they intend to publish in a separate form some of the papers which it is expected will be presented on the occasion, whilst others will be combined together in the form of one joint volume.

We regret to hear that the *Programmes* published during the last two years by the professors at University College, London, are to be discontinued. The following is a list of the historical monographs which have appeared during the last year in Prussia, under the modest form of *School Programmes*, i.e., papers read at the terminal gatherings of friends and parents—the speech-days—by the masters:—

1. DR. MÜCHE, Forschungen über den römischen Kaiser M. Aurelius Severus Alexander. Schweidnitz: Gymnasium.
2. BACHMANN, Disputatio qua antiquitatis Germanicæ reliquias, quæ Wernigerolae asservantur, ad illustrandum Taciti Germaniam adhibere conatur. Wernigerolae: Gymnasium.
3. DR. F. HIRSCH, Kaiser Constantin VII. Porphyrogenetos. Berlin: Königsstädtische Realschule.
4. KLUGE, Ueber die ursprüngliche Bedeutung u. Gestalt der Johannisfeste und der damit verwandten Feiern. Mühlhausen: Gymnasium.
5. PROF. PIENSON, Ueber die Nationalität u. Sprache der alten Preussen. Berlin: Dorotheenstädtische Realschule.
6. FRANZ JOEHLING, Karl Martell. Rogasen: Progymnasium.
7. GEGENBAUD, Das Kloster Fulda im Karolinger Zeitalter. Fulda: Gymnasium.
8. AUST, Ueber die Ausbildung der Vassallität u. des Lehnswesens. Hirschberg: Gymnasium.
9. SCHÖNER, Vorwürfe und Anklagen gegen Gregor VII. aus den Schriften seiner Zeitgenossen. Nordhausen: Realschule.
10. DR. BRAUN, Die Tage von Canossa unter Heinrich IV. Marburg: Gymnasium.
11. DR. BÖHMKE, Zur Geschichte des Cistercienser Klosters St. Marien zur Porta. Porta: Landesschule.
12. DR. ADLER, Aeltere Geschichte des am Fusse des Zoltenberges liegenden Dörfer des Augustin- u. Chorherrn-Stiftes auf dem Lande zu Breslau von 1300-1309. Breslau: Realschule am Zwinger.
13. DR. WACHSCHILD, Ueber die politischen Beziehungen zwischen Brandenburg, und Hessen-Cassel bis zum Augsburger Religionsfrieden. Cassel: Höhere Bürgerschule.
14. FR. OTTO, Die Theilnahme der brandenburgischen Truppen an der Expedition Wilhelm III. von England. Wiesbaden: Gymnasium.
15. DR. DUSCHKE, Der Freiherr von Stein und die deutsche Frage auf dem Wiener Congresse. Hanau: Gymnasium.
16. HEINZE, Deutschland's historisch-geographische Gestaltung von der ältesten Zeit bis auf die Gegenwart. Görlitz: Realschule.

In the first May number of the *Revue des Deux Mondes*, M. Albert Réville contributes an article on the Albigenses, based upon the history of that sect published by M. Napoléon Peyrat in 1872. Without an assignable founder, the ascetic sect of the Cathari, called Albigenses from Alby in Languedoc, where they once conferred without result with the Catholics, disseminated itself through the southern provinces of France and the north of Spain and Italy. Its existence may first be traced as early as 1022, when two priests and their partisans were burned at Orleans "for Manicheism;" during the twelfth century it numbered amongst its adherents many of the great families of the south of France, and became identified with the patriotic struggles of the South against absorption into the kingdom of France, which was half the motive and the main result of the so-called Albigensian Crusade. Deserted subsequently by the noblesse, it dragged on a miserable and sporadic existence till the middle of the fourteenth century, under the incessant blows of the Inquisition; and has left behind it the great ossuaries of Ornat and the Château de Foix to testify to its sufferings and to the vigorous measures of its persecutors. M. Réville calls Catharism the last of the ancient rather than the first of modern heresies; as it opposed a definite hierarchical and metaphysical system to the hierarchy and theology

of the Catholic Church, and was essentially aristocratical in its internal structure, whilst the characteristic of modern heresy is the substitution of inward piety and charity in the place of both cultus and dogma, and a certain solidarity with the development of democratic institutions. But to the question through what obscure channels a dualistic system of metaphysical dogma, so like Manicheism, could have penetrated into the heart of Western Christendom, the writer is unable to give a much more definite answer than we had attained before.

It is stated that a house of historic interest is being demolished at Berlin. This house, No. 17, Taubenstrasse, was the residence of the Electors of Prussia before Berlin aspired to be one of the great capitals of Europe. Towards the middle of the last century it was inhabited by Voltaire during his stay at Berlin, and it was thence that he assailed Maupertuis, the President of the Academy of Berlin.

NOTES OF TRAVEL.

PERE DAVID, who has spent so much time in the investigation of the central provinces of China, has arrived at Shanghai in a weak state of health, and has brought with him some valuable scientific spoils, the result of his recent researches in Kiangsi.

ANOTHER volcanic disturbance has recently spread desolation and terror through the little island of Niceros. A little more than a year ago, after a series of earthquakes which caused some damage, the summit of the highest peak in the island suddenly burst open and released the volumes of steam and boiling water which, in their struggles to find an exit, had well-nigh caused the destruction of the island and every living being on its surface. This first eruption was of short duration, and the disturbance subsided almost as suddenly as it began. Apparently the volcano had expended its forces, and the alarm gradually died away. But on the 1st of last month the eruptions commenced afresh, and with a violence even greater than on the previous occasion. Boiling water was emitted in such quantities that, at the date of the last advices, sent on April 4, it threatened to destroy the fertility of the surrounding soil, which is esteemed the best in the island. At the same time earthquakes convulse the ground, and the inhabitants have taken to the open fields, where they are safer than under their tottering houses.

We learn from the *Levant Herald* that the International Commission appointed to consider the best means of removing the ledge of rocks known as the "Iron Gates," and otherwise improving the navigation of the Danube in the neighbourhood of Orsova, having taken soundings of the bed of the river, left Orsova at the commencement of the winter for Pesth, and have now completed their task. They calculate that the cost of destroying the Iron Gates and levelling the river above and below Orsova will amount to about 14,000,000 francs, and their plans and estimates have been already lodged at the Hungarian Ministry of Public Works. These will be forwarded to the Minister for Foreign Affairs at Vienna, whose province it will be to come to an understanding with the Turkish Government as to its share in this important undertaking. It is stated that, if the Porte should feel itself unable or unwilling to contribute its pecuniary proportion of the outlay for this international improvement, the Austro-Hungarian Government will probably take the enterprise upon its own shoulders, and will commence the necessary works forthwith, unless any unexpected political complications should supervene.

THE *Geographical Magazine* states that Don Vicente Ballivian y Roxas has commenced the publication of a most valuable and interesting series of inedited documents relating to the history of Upper Peru—the modern Bolivian Republic.

The first volume, which has been published at Paris, contains a diary of the siege of La Paz, by the insurgent Indians, in 1784, the annals of the town of Potosi from its foundation to 1702, and a catalogue of printed and manuscript works relating to Upper Peru during the period of Spanish domination. This list has been carefully prepared, and is invaluable to historical or statistical enquirers.

AN article in the current number of the *Quarterly Review* gives the clearest and most impartial account of Russian advances in Central Asia that has yet appeared, closed by an eloquent summary of the probable causes that have urged and are still urging Russia in her career of territorial aggrandisement, and of England's concern therein. The reviewer considers that the threatened advance to Marv would be *distinctly hostile*, and without fair pretext; the Turkomans who inhabit that oasis belonging to tribes unconnected with those who refused tribute to Russia after the capture of Khiva. He considers the Emperor and his ministers sincere in their desire to desist from conquests, which are forced on them by unscrupulous generals and a corrupt military aristocracy. While agreeing that invasion of India from the north is but a "distempered dream," he is fully alive to the internal dangers which menace our Indian empire from the present unsettled state of affairs in Central Asia. He concludes by indicating our true policy in words which we cannot help quoting:—

"In freeing English statesmen, for the future, from any obligation to credit their professions and assurances, and helping to convince the country of the necessity of placing competent British representatives near the spots proximately menaced, for the purpose of exposing misapprehension and checking intrigue, the military nobles, who are responsible for the recent policy of Russia, will, if we only take the lesson, have done real service to the cause of peace."

The article should be read and studied by every one who knows or cares anything about Central Asia and its relations to India, whether apologist or opponent of Russian policy.

THE first fair ever held in the city of Tashkend, in Russian Turkestan, was formally inaugurated on April 7 last.

THE Khan of Khiva appears to be fully impressed with the necessity of getting into good odour with his new masters. He has (according to the *Invalide Russe*) remitted to Colonel Ivanof part of the tribute paid by the Yomud Turkomans and part of the plunder taken by them on the occasion of their last raid on the right bank of the Oxus. The Khan has also graciously executed five inhabitants of Kiptchak who had ventured to offer a little opposition to the Russian detachment on the occasion of its march, in January last, along the Amu. This expedition has exercised a most salutary effect on the Turkomans' behaviour. The Persians no longer complain of their attacks, and the Khan of Khiva thinks there will be no difficulty in getting them to pay a regular tribute to Russia, and that complete order will soon be established among these hitherto refractory nomad tribes.

ALGERIA, it appears, stands first among countries noted for their mineral waters, in respect of the number, variety, and hygienic properties of her springs. In most cases ruins in the immediate vicinity attest the fact of the old Romans having appreciated the curative qualities of the waters quite as much as the Arabs of the present day do. The principal of these springs are Amman Rhira, on the ruins of Aquae Calidae, famed in the time of the Roman emperors, the waters being very similar to those of Baden and Lucca; Hammam Meluan, about twenty-one miles from Algiers, the waters of which are highly saline as well as mineral, and are particularly efficacious in cases of rheumatism, gout, and skin diseases; the sulphurous springs of Hammam Berruagua, the temperature of which is about

81° Fahrenheit; the "Queen Baths," close to Oran, originally founded by Joanna, daughter of Isabella the Catholic (the grottoes adjoining the springs are in this case converted into *sudatoria* or hot rooms); and, lastly, the Hammam Meskutine (Aquae Tibilitanae), which are situated in the midst of a lovely entourage, and the waters of which attain a temperature of from 126° to 169°, and are peculiarly suited for the cure of diseases of the joints and skin affections.

WE find some interesting facts concerning the quicksilver mines of New Almaden (California) in the account of M. Simonin's journey from New York to San Francisco, which has appeared in the *Tour du Monde*. These mines are the richest known, and, before the arrival of the Spaniards, had been worked by the Indians by means of narrow galleries excavated underground. The mineral extracted (red sulphate of mercury) was pounded between two stones, and used by them as a tattooing dye. The Mexicans, in their turn, worked the mines with energy, and when the Americans in 1848 reached the Pacific Ocean, the eagerness of the workers had indirectly brought about a crop of lawsuits. From November 1858 to January 1861, the mines were, in consequence of this, closed, to the great distress of the miners, the metal being procured instead from Almaden in Spain.

There are now about six hundred workmen, who earn from two and a half to three dollars apiece per diem. The out-turn amounts to about 1,000 tons of ore per month. The vein of mercury runs from north to south in a green serpentine rock. There are three steam-engines employed in the mine for the carriage of the mineral, for the distribution of the water supply and purposes of ventilation; the furnaces are outside, to guard against possibility of explosions. The workmen are greatly subject to trembling fits and to other ailments; in fact, it is on account of the excessive mortality which attends the production of mercury that the mines of Riga and Livigliani, in Tuscany, and of Huancaoclica, in Peru, have been closed. Thus Almaden, in Spain, and New Almaden, in California, are the two great existing mines, London and San Francisco being the chief markets for the metal. In China there is also a good demand for the mercury in the making up of vermilion, which is largely used in Chinese pictures and earthenware.

As far as regards mineral products, there are few countries more favoured than California; gold and mercury are abundant, while there is also a good supply of coal, copper, borax, and sulphur.

THE last number of the *Revue d'Anthropologie* contains some details with regard to the Akkas, or nation of dwarfs, rediscovered by Dr. Schweinfurth in the heart of Africa (see *ACADEMY*, vol. v. p. 336). King Mounsa allowed Dr. Schweinfurth to take one of these dwarfs with him, but he unfortunately died on the journey. An Italian traveller, Signor Miani, since dead, afterwards bought two of the dwarfs of King Mounsa, who are now in Italy. They have been examined by the Egyptian Institute, and clearly proved to belong to the human race, though to a very low family of it. Their chief peculiarity is the convex curvature of the vertebral column, which renders the belly very prominent, and constitutes a great resemblance to all the large anthropoids, except the Gibbon. This characteristic would be of great importance if it were shown to belong to the whole race of Akkas, who would then be the only members of the human species deprived of the normal conditions of the erect attitude; but the peculiarities of the two Akkas who have come to Europe may be simple deformities, and it is possible that they filled the same place at the court of King Mounsa, as the fool in the mediæval courts of Europe. According to their photographs, the face lacks intelligence, though the forehead is fairly large; the jaws are very projecting. In spite of their short stature, their proportions are regular; the hands and feet being remarkably small. The belly is large and project-

ing, the hair curly and wavy, the nose flat. The colour of the skin is a deep brown chocolate. The elder is 1.11 mètre in height, and the younger 1 mètre. Their precise age is difficult to determine, but it is thought, from the state of their teeth, that they have not yet attained their full stature, especially if, as M. Broca thinks, the negroes get their second teeth earlier than Europeans. Dr. Schweinfurth gave 1.50 mètre as the utmost stature attained by the Akkas, and his estimate may be accepted as correct, these two young Akkas having declared that their low stature is not exceptional, but is common to all their people.

THE *North China Herald* says:—"It is gratifying to know that the Chinese Government has received very favourably a proposal that it should co-operate in the Universal Exposition of Products and Manufactures, which is to be opened at Philadelphia in 1876. . . . Orders are to be issued [from Peking] to the northern and southern superintendents of trade and other provincial authorities, to have the design of the Exposition made known by proclamation to the mercantile, manufacturing, and producing classes, and inviting them to prepare exhibits to be forwarded under government auspices. A special commission is promised to attend the Exhibition and superintend the Chinese department."

THE BRITISH MUSEUM.

THE Annual Return to an Order of the House of Commons of the Income and Expenditure of the British Museum during the financial year ending March 31, 1874, has just been issued. With it is embodied a statement of the progress made in the arrangement of the collections, and an account of objects added to them in the year 1873. This very meagre Parliamentary paper, issued in the most unattractive form possible, is the sole official medium through which the public may become acquainted with the important additions that are being made from time to time to one of the noblest of our national institutions. We give here a summary of some of the most noteworthy contents of this Return. Mr. W. B. Rye, Keeper of the Department of Printed Books, enumerates among the chief acquisitions during the year:—

"A perfect copy of the edition of the *Book of Common Prayer*, dated 1603, in folio, commonly called the 'Hampton Court Book,' in which appear for the first time the alterations agreed upon at the Hampton Court Conference in January 1603-4. This would seem to have been unknown at the time of Pickering's reprint, which was made from the folio edition dated 1604.

"A copy, believed to be unique, of the original edition of Tyndale's *Exposition of the fyrste Epistle of saynte Jhon*, printed abroad and issued in September 1531, while Tyndale was at Antwerp. This work was strictly prohibited in England, and in the following year was denounced by Sir Thomas More in these terms: 'Then have we fro Tyndale the fyrste pyste of saynte Jhon in suche wyse expowned, that I dare say that blessed apostle rather then his holy wordes were in suche a sense bylevered of all Crysten people, hadde lever his pyste hadde never ben put in wrytynge.' The reprint of the work by the Parker Society was made from a later edition.

"Many early English books have been purchased, including a copy of the very rare first edition of the poetical collection entitled *England's Helicon*, 1600; Robert Chester's poem, *The Annals of Great Brittain*, otherwise entitled 'Love's Martyr,' 1611; a poem by John Weever on the 'Life and Death of Sir John Oldcastle,' 1601; besides 225 black-letter English ballads printed in the reigns of Charles II., James II., and William III., forming a valuable addition to the Roxburgh, Bagford, and other collections already in the Museum. Several works illustrating English dramatic history and biography have also been acquired, and a large number of English books printed in the eighteenth century.

"An extensive and interesting selection of linguistic books, chiefly from the library of M. Burgaud des Marets, comprising works in the Basque language, in

the Patois dialects of France, Spain, and Italy, in Breton and other Celtic languages.

"Large additions have been made to the collection of Russian books, already extensive, by a careful selection from the library of the late M. Serge Solowewski, of Moscow. This acquisition has added about 700 works of importance and value.

"A collection of Indo-Portuguese works printed at Goa.

"A considerable purchase of Chinese classical and historical works, made at the sale of the library of the late M. Pauthier.

"Among the accessions to Music may be mentioned a collection of early English and Italian madrigals, motets, &c., from the library of the late Thomas Oliphant, Esq."

To the Department of Maps, Charts, and Topographical Drawings have been added, amongst other things of interest:—

"A photograph fac-simile, the exact size of the original, of the superb *Mappemonde* made at Venice in 1457-59, at the instance of Prince Henry the Navigator, and at the expense of his uncle, King Alfonso V., by Fra Mauro of the Camaldalese Convent of San Michele di Murano, on account of which a medal was struck in his honour by the Republic, describing him as 'Cosmographus incomparabilis.'

"A photograph fac-simile, in fifteen sheets, of the famous *Mappemonde* in the National Library, Parma, made in 1367 by the Venetian brothers Pizzigani. This fac-simile was made expressly for the Trustees. Both these *Mappemondes* are of high importance to the history of mediæval geographical discovery.

"An important collection of maps, plans, and sections of canals in England and Wales, in 620 sheets.

"And a collection of twenty-three manuscript maps and plans of various places in India, made in the last half of the eighteenth century."

The Keeper of the Department of Manuscripts, Mr. E. A. Bond, has increased his collection with the following, amongst others:—

"Bede's *Exposition of the Gospel of St. Luke*, in six Books. An English MS. on vellum of the twelfth century; finely written, with ornamental initial letters, and in an ancient binding. Small folio.

"The *Gesta Romanorum*, and portions of the *Moralitates* of Robert Holcot; written on paper, by a German hand, in the fifteenth century. Quarto.

"A carefully written copy of John Arderne's treatises on Fistula, Surgical Operations and Medical Recipes, in Latin, with numerous coloured figures in the margins, and drawings of operating-instruments. The same volume contains an English version of Johannes Platearius de *Simplicibus*, and tracts on Medical Botany, one of which is accompanied with clever drawings of plants. Vellum, fifteenth century. Folio.

"A Chantuary of the Monastery of St. Swithin of Winchester, containing copies of documents from the time of Edward the Confessor to King Henry the Third: written in the thirteenth century, with later additions of custumaries, rentals, etc., of the fifteenth century. Vellum. Folio.

"An illuminated Latin Psalter of about the year 1300; originally the property of the family of Bailoul of Flanders. Quarto.

"A very richly-illuminated book of the Hours of the Virgin, written in France at the beginning of the fifteenth century. The borders are of arabesque work, with birds and insects, and grotesque figures. The calendar is illustrated; and there are fourteen larger miniatures, painted apparently by an Italian artist, or by one showing strong Italian influence, who has also added to the ornamentation throughout the volume."

Two of these miniatures are very striking; one at the beginning of the volume representing the Annunciation, in which the architectural details deserve attention; and the second presenting a vivid picture of the torments of hell, figures in the monastic garb forming a fair proportion of the doomed. This manuscript was purchased at the Perkins' sale. Another from the same collection is described as

"A long Legendary Life of the Virgin Mary, compiled from Epiphanius, Ignatius, Johannes Damascenus and others, in Latin rhyming verse, in four books; with prologues to each. On paper; written probably in Flanders, in the fourteenth century, and profusely illustrated with curious outline drawings, slightly coloured, by different hands. Small quarto."

Of historical interest we notice these additions:—

"The Memoirs of Sir John Reresby, Bart., to the year 1689.

"Sir George Buck's *History of Richard the Third*: a MS. of the middle of the seventeenth century; with collections for an edition of the work by Charles Yarnold, in three volumes.

"Original Minutes of the General Assembly of the Chapter of the [Roman] Catholic English Church, held in May 1687; signed by Dr. Humphry Ellice, Dean, and other members.

"Correspondence and Papers of the Earl of Leicester, commanding in the Low Countries, 1587.

"Official Letters from the Council of State and Committee of the Parliament, the Earl of Essex, and others, to Colonel Sydenham, Governor successively of Weymouth and the Isle of Wight, from 1644 to 1659. Many are signed by John Bradshaw, President of the Council.

"A volume of Original Letters of Caspar Peucer, M.D., one of the promoters of the Reformation in Germany, to Christian, Prince of Anhalt, on subjects of science and politics, in the years 1587 to 1600. In Latin and German.

"One hundred and thirty-six Original Letters of Lord Nelson to Alexander Davison, on public and private affairs; dated from 1797 to 1805. The greater number are printed in Sir Harris Nicolas's *Despatches and Letters of Nelson*."

Among the other manuscripts added are thirteen volumes of official accounts of the theatres of Lincoln's Inn Fields, Drury Lane, and Covent Garden, from 1724 to 1822, with notices of performances from the year 1710; and some autograph notes by Beethoven for arrangements of English, Welsh, Scottish, and Irish airs. The note-books and collection of the late Mr. Grote, which are also mentioned in this return, have already been described in these columns.

Under this class we must notice the large additions to the series of Additional Charters and Rolls. These are formed of two collections. The first is a small but very choice set of charters, presented by the Duke of Westminster, relating to the Abbey of Reading, in Berkshire. Among them are charters of Henry I., his Queen, Adeliza, Stephen, and the Empress Matilda. Some very fine specimens of the seals of Stephen are also contained in this series. The second set, which from its extent and intrinsic value is by far the most important acquisition of the Department during the year, is known as the Hatton Collection, having been principally formed by Christopher, Lord Hatton. It numbers 2,826 different documents, commencing with as many as fifteen charters of the Saxon period, and is particularly rich in documents and seals, many unique, of the monastic houses of the midland counties; Sempingham, Sulby, Bordesley, Pipewell, and other foundations in the counties of Northampton, York, Lincoln, and Warwick, being well represented. Among them are the foundation-charters granted by Gualeran, Count of Mellent, to Bordesley Abbey; and another with the Great Seal of Matilda, which is dated from Devizes, probably when she was besieging that stronghold, *circa* 1146.

Of the additions to the Department of Oriental Manuscripts the following are the most remarkable:—

"A poetical account of the Chinese conquest of Nepal in A.D. 1790, written by the Emperor of China; a folio volume enclosed in curiously carved wooden covers, from the Summer Palace, near Peking. The entire text is embroidered in red silk on blue ground, it is said, by the ladies of the Imperial family.

"The *Sidra Rabba*, also known as 'Liber Adami,' the sacred book of the Mandaites, or so-called Christians of St. John. Presented by Earl Granville.

"A collection of Legends relating to the incarnations of Buddha, transcribed from a number of palm-leaf manuscripts in Burmah; in the Pali language and Burmese character. A thick quarto.

"The Anaphoras of the Coptic Church, in Coptic, with Arabic version, written apparently in the thirteenth century. Quarto.

"Fragments of Syriac, Coptic, and Arabic manu-

scripts from the Syrian convent of Nitria, Egypt. Presented by the Rev. Greville J. Chester.

"A Pali grammar and two Buddhistic works, viz., *Vessantara Jātaka* and *Mahavassantara Jātaka*, in the Pali language and Cambodian character, written on palm leaves, with miniatures; enclosed in lacquered boards inlaid with mother-of-pearl.

"Four Persian versions of the legend of Rāma, two in prose and two in verse. *Judina-Bhāskara*, a medical work in Sanscrit. Presented by A. W. Franks, Esq.

"*Amara-Kosha*, a Sanscrit Glossary, with explanations in Oriya.

"*Phra-Maha-Wak*, a work on the laws which govern the Buddhist priesthood, in twenty-one parts, on palm leaves; Pali in the Burmese character. Presented by L. B. Bowring, Esq.

"A Commentary on the Prophets and Psalms, by Aaron Ha-Rishon, the Macedonian; Hebrew, dated A.D. 1436. Large quarto.

"*Sepher Ha-Aruch*, a Hebrew Dictionary, by Shabtai Ben Meir; two large folios of the fourteenth century.

"A history of the *Micados* in Japanese; thirteen volumes, enclosed in a box of lacquered wood. This work, it is said, was written for private use and has never been printed.

"*Falaknāz-Namah*, a tale in Persian verse, with miniatures; written A.H. 1257 (A.D. 1841)."

The most noteworthy acquisitions by the Department of Greek and Roman Antiquities are those from the collection of M. Alessandro Castellani (see ACADEMY, vol. iv. p. 106). Some of the bronzes are thus described in the Return by Mr. C. T. Newton:—

"A female head of heroic size; the type is ideal, and has been attributed to Aphrodite, but seems rather to present the characteristics of Artemis. The style has that largeness and simplicity which is characteristic of the best age of Athenian art, and of which no example in bronze on so large a scale had been previously known. This head has evidently belonged to a statue about nine feet high, from which it has been violently separated, the back of the head and neck having been torn or cut away. The face is in admirable condition, the nose and mouth are perfect, the eyes have been filled with precious stones or vitreous pastes. In the front view the two sides of the face do not agree. This want of drawing is probably due in a great measure to the violence to which the metal was subjected when the back of the head was wrenched away. This head is said to have been found in Armenia.

"A small heroic male figure seated on a rock, the head looking round. This figure is in high relief, and from the appearance of the back of the bronze has probably been attached, as an *emblem*, to some larger object. From the attitude of the figure it is probable that another similar figure formed its pendant. This bronze is remarkable for beauty of modelling and exquisite condition. It may be referred to the finest period of Greek art, and is worthy to be compared with the celebrated bronzes of Siris. Found at Tarentum.

"A small draped female figure; the type is that known as Aphrodite-Persephone, which is repeated in the Roman Spes. In the pupils of the eyes are diamonds, and the border of the drapery is inlaid with a pattern in silver. This figure may be classed as an example of what is called Hieratic art, in which we find the style of the archaic period retained, probably from religious associations, till a later period. The surface of the bronze is in very fine condition. Found at Verona.

"A bust of Aelius Cæsar, in fine condition. The eyes are inlaid in silver. The execution is rather mannered, but the characteristics of the likeness are forcibly rendered. From Sicily."

Of the drinking cups in the Castellani collection, which are nearly all from Capri, the two following seem the most choice:—

"A deep cup with red figures on a black ground, in an archaic style; subject, the sending forth of Triptolemos from Eleusis. In this composition are represented all the deities and heroic personages who took part in the Eleusinian Mysteries, their names being inscribed over them, together with that of the vase-painter, Hieron.

"A cup with red figures on a black ground, and with accessories gilt. On the outside are two scenes

from the Satyric drama, the one representing Iris assailed by Satyrs, as in Aristophanes; the other Hera assailed by Satyrs and defended by Hermes and Herakles. The names of these figures are inscribed on the vase, as is also that of the vase painter, Brygos."

The most important additions to the British Antiquities in the Museum are the collection formed by the late well-known antiquary, Dr. Thurnam, F.S.A., consisting of British urns, stone and bronze implements, a rare Roman arm-purse found at Farndale, Yorkshire, and numerous other antiquities, chiefly discovered by him in his researches among British barrows; and a portion of the collection of the late J. F. Lucas, Esq., of Bentley Hall, near Ashbourne, Derbyshire, including nine British urns from Derbyshire and Huntingdonshire, jet ornaments from early British barrows; the pomel of a late Celtic sword; Anglo-Saxon remains from Tissington, and Wigberlow, in Derbyshire, and from Woodstone, Huntingdonshire.

Large acquisitions have also been made by the Departments of Mediaeval Antiquities and Ethnography, of Coins and Medals, of Natural History, &c.; but want of space compels us to seek another opportunity of giving a sufficient account of them.

CORRESPONDENCE.

THE WORD "ROSE."

Cambridge: May 5, 1874.

I feel much obliged to Professor Müller for his long and interesting letter on the word *ward*, *vard*, or *verd*, in the ACADEMY for May 2. The difference of opinion between us is, after all, not very great. What I meant to say—perhaps I may not have expressed myself clearly enough—was, that he should not treat the said word in *Turkish* as a Persian, but as an Arabic vocable.

The common Persian word for "rose" is *gul*, which the Turks have borrowed. The common Arabic word for "rose" is *ward*, which both Persians and Turks have borrowed. Of the original identity of the two, neither Persian or Turk has, I imagine, the slightest idea; on the contrary, they, or at least the educated portion of them, believe themselves to be adorning their speech with an elegant Arabic word. And they are right to this extent, that *ward* has become thoroughly Semiticised; that it has flourished on Arabian soil, and put forth leaves and flowers in abundance. For instance, the Arabs have formed from it a noun of unity, *warda* (originally *wardat*), "a single rose;" a verb *warrada*, "to stain or dye red;" another, *tawarrada*, "to become red or rosy;" and a third, *irādda*, "to be ruddy." They also use *ward*, fem. *warda* (*wardat*) as an adjective, "rosy, roseate, ruddy;" e.g. *ashīya warda*, "a rosy evening," the counterpart of *ῥοδοδάκτυλος ἥως*. Hence *al-ward* is "saffron," but also "the tawny lion," and likewise "the roan horse," in which sense it makes the plurals *ward*, *wardā*, and *wardāt*, the colour itself being expressed by *warda* (*wardat*). We find the rose called by the same name in another Semitic language, the Aramaic, where we have the form *wardā*. As a rule, in pure Semitic words, Arabic initial *w* corresponds to Hebrew and Aramaic *y*; e.g. Arab. *waritha*, Aram. *yērēth*, *irēth*, Heb. *yārēsh*. Hence Professor Spiegel's remark about the initial letter of *wardā* is justified; though there are examples to the contrary, where a *w* has remained unaltered; for instance, Syr. *wālē*, connected with Arab. *waliya*, and *wardā* with Arab. *warda*, Heb. *yārād*. The form *rūdā*, also given in the Syriac lexicons, is probably directly borrowed, at a later period, from the Greek *ῥόδον*; and the same may be the case with the Aethiopic *radā*; whilst, on the other hand, the Coptic *ouert*, *bert* (*ort*), seem to be derived from the Semitic. Whence then come the Arabic *ward* and the Aramaic *wardā*? Very probably, as Professor Müller shows, from an old Persian word *vareda*, meaning at first "a flower" in general, and afterwards "the rose" in particular. In confirmation of this view I may mention that the Arabic *ward* also means "a flower" (*nawr*), in which sense it gives rise to a verb *warrada* = *nawwara*, "to bud or blossom." Some, too, of the Arabian lexicographers have a suspicion that the word is not genuine Arabic, but only *mu'arrab* or arabicised. As to *vartā* in the Pehlevi-Pazend glossary, it seems to be nothing but the Aramaic *wardā*, for at one period Semitic loan-words were in great vogue in Persia. It was from a Semitic race too, I fancy, that the Greeks got their *ῥόδον*, *ῥόδωρ*.

After the ancient *vareda* had passed in the course of time into the form *gul*, this latter was adopted by the Arabs, at least as early as the time of Muhammad, and appears in their poetry as *jull*; whilst the derivative *gul-āb*, "rose-water," became *jullāb*, or *julāb*, dialectically pronounced *julēb*. Hence a variety of forms in different modern European languages; as Greek *ζωλῆπιον* and *ζωλῆπιον*, Italian *giulebbe* (*bo*), Spanish and Portug. *julepe*, French and English *julep*. From the same word, changing *j* into *z*, are derived Persian *zulābiyā*, *zilābiyā*, *zaliyā*, &c., "a sort of sweet fritters," in Arabic *zalābiya*, in Hindustāni *julēbi*. Hence, if Professor Müller could only admit a connexion between *ῥόδον* and *rosa*, we might find an etymological bond of union between the

"dog-rose" of our hedges and the "mint-julep" of New York.

It is thus apparent that the series *vareda*, *ward*, *gul*, *gôdov*, is almost as interesting as another series, about which I should like Professor Müller to state his views—I mean, *airos*, *vinum*, *wine*, Arab. *wain*, "black grapes," Aethiop. *wain*, "the vine" and "wine," Heb. *yayin* (for *yain*, with the usual change of *w* into *y*), "wine."

W. WRIGHT.

P.S. A few words to Mr. Taylor. Gibbon's statement regarding the founder of the Ottoman Empire seems to be merely translated from De Guignes, *Hist. Gén. des Huns* (ed. 1758), t. iv. p. 334:

"Parmi tous ces Emirs il y en avoit un que les Historiens Arabes contemporains nomment Thaman ou Athman,* qui avec Amerkhan et quelques autres, ravagèrent les provinces orientales de l'Empire Grec. Athman, ou, comme on l'appelle communément, Othman, pilla les environs de Nicomédie."

I cannot at present verify this assertion of De Guignes; all the sources of information to which I have access simply write the name 'Othmān or Osmān. The Turk, of course, merely received or took a name already famous in Muhammadan history; which is nothing strange, as Turks had been in the habit of doing so long before his time, witness the lists of the different Seljūk dynasties. Mr. Taylor may deal as he thinks fit with Toman, Tumen, &c., but he ought to let alone the Arabic name 'Othmān, عثمان, and its derivative 'Osmānle or, as Mr. Redhouse writes it, 'Ossmānli, عثمانلي, because they can be of no use to him. As for Mr. Taylor's letter in the *Athenaeum* of May 2, his ways and mine lie, philologically, so wide asunder, that it would only be a waste of my time to attempt to reply to him.

Dover: May 4, 1874.

Perhaps it may interest Professor Max Müller, as sustaining his theory that *vard* is a Persian word, to hear that the village four miles from Shirāz, round which are grouped the famous rose-gardens of that city, is named "Masjid-i-Vardī," vulgarly pronounced Masjid-i-Bardī.

O. ST. JOHN.

THE REDUNDANT "AND" IN BALLADS.

1 Cintra Terrace, Cambridge.

In an interesting communication to the ACADEMY (April 25, 1874), Mr. Murray very properly draws attention to the use of *and* in Danish ballads, showing that it is common enough, and that a similar redundant *and* occurs in Swedish and Norwegian ballads. Then comes a reference to some remarks of Professor F. Liebrecht, in which the opinion of Dr. Abbott is quoted with approval, that a redundant *and* is common in English ballads; whilst an opinion of mine, of an opposite tendency, is quoted with disapproval. I was speaking of a *particular* passage in a particular ballad, which I believe I have interpreted rightly. But what I wish to do is just to raise this simple question, for my own satisfaction, viz., *Is* the use of a redundant *and* really common in genuine old English ballads? Dr. Abbott says it is; but I am not so sure of that. The question admits of an easy solution. If the phrase is "common," it is not asking too much if I request to be favoured with *six* instances of it, not from imitations of *Cherry Chase*, but from such ballads as are of a respectable antiquity. When this has been done, we shall be in a better position to consider the question.

WALTER W. SKEAT.

THE LATE OWEN JONES.

May 4, 1874.

It may not be generally known, and perhaps it is worth recording, that the late Mr. Owen Jones,

* "C'est un nom Turc que l'on a ensuite confondu avec celui d'Othman qui est Arabe."

author of the *Grammar of Ornament*, was the only son of the patriotic Owen Jones, who in the first decade of this century published at his own expense three large octavo volumes of the earliest literary remains in the Welsh language. He was a native of Llanvihangel Glyn Myvyr, on the borders of Denbighshire and Merionethshire; and from the name of the parish in which he was born he assumed the *nom de plume* of "Owain Myvyr;" and it was from this assumed name that the collection just referred to was designated "The *Myvrian* Archaeology of Wales,"—an epithet which has been a puzzle to many. As has been most justly remarked by Mr. Matthew Arnold, referring to the patriot's grave in Allhallows Churchyard, "his book is the great repertory of the literature of his nation. The comparative study of languages and literatures gains every day more followers, and no one of these followers, at home or abroad, touches Welsh literature without paying homage to the Denbighshire peasant." The son has left behind him a world-wide reputation; but the name of the less distinguished father will never die in the little Principality of Wales.

D. SILVAN EVANS.

MR. STOREY'S "MEDEA."

Hereford: May 4, 1874.

Mr. Simcox is not quite accurate in saying that all Mr. Storey's great statues are seated women, and that he *never* makes them stand. I think we must certainly include among Mr. Storey's "great" statues, his "Medea" (heroic size), in the possession of Mr. W. H. Stone, of Leigh Park, Havant, and that is a standing figure. As Mr. Simcox does not appear to have seen this fine work, it is probable that many of your readers have not. I am not aware that it has been exhibited in London, as it came direct from the artist's studio at Rome to the owner. A loan exhibition of works of art was, however, being held at Southampton at the time of its arrival—the autumn of 1866—and Mr. Stone allowed it to be shown there for a few days.

EUSTACE HINTON JONES.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, May 9,	3 p.m.	Royal Institution: Mr. Proctor on "The Planetary System."
	8.45 p.m.	Royal Botanic.
MONDAY, May 11,	3 p.m.	Herr Pauer's Second Historical Pianoforte Recital (Hanover Square Rooms).
	8 p.m.	Society of Arts: Cantor Lecture. Professor Barff on "Carbon and Certain Compounds of Carbon." (V.)
		Madame Favart at the Princess's Theatre.
	8.30 p.m.	Geographical. Captain Glover on "The Geography and Resources of the Country between the River Volta and Coomassie."
TUESDAY, May 12,	8 p.m.	Civil Engineers: Mr. J. McC. Meadows on "Peat Fuel Machinery."
		Anthropological Institute. Photographic.
	8.30 p.m.	Royal Medical and Chirurgical.
WEDNESDAY, May 13,	1 p.m.	Royal Horticultural.
	1.30 p.m.	Archaeological Association: Anniversary.
	3 p.m.	Royal Literary Fund.
		Mr. Ridley Prentice's Piano Recital (St. George's Hall).
	8 p.m.	Society of Arts.
		Geological: Mr. H. G. Seeley on "Generic Modifications of the Plesiosaurian Pectoral Girdle," and "Muraenosaurus Leedsii, a Plesiosaurian from the Oxford Clay;" Mr. L. C. Miall on "The Remains of Labyrinthodonta from the Kemper Sandstone of Warwick, preserved in the Warwick Museum."
	8.30 p.m.	Wagner Society: Last Concert of the Season (St. James's Hall).
THURSDAY, May 14,	1 p.m.	Sale at Sotheby's of Mr. G. Walker's Collection of Works on Chess.
	8 p.m.	Mathematical.

FRIDAY, May 15,

- 1 p.m. Sale at Sotheby's of a Collection of Rare and Valuable Works, principally on Chess.
- 3 p.m. Royal United Service Institution: Captain Glover, R.N., on "The Volta Expedition during the late Ashantee Campaign."
- " Hallé's 2nd Recital (St. James's Hall).
- 8 p.m. Royal Institution: Mr. C. W. Siemens on "The Steamship *Faraday*, and her Appliances for Cable-laying."
- " Philological: Anniversary Meeting, President's Address.

SCIENCE.

The Moon. By Nasmyth and Carpenter. (London: John Murray, 1874.)

WHEN a man has devoted the greater part of a lifetime to the study of a subject, we may feel sure that he will have something interesting to say about it, more especially when the subject offers so much food for thought as the Moon does. Few persons can have gazed on the moon through a powerful telescope without having some of the dormant poetry of their nature awakened by the beauty of the spectacle, and Nasmyth seems early to have felt this spell, for the theory which forms the basis of the present work was first broached by him some thirty years ago.

The great difficulty in giving an explanation of the formation of the various lunar features is, that we can get nothing but a bird's-eye view of them, and it is, as every one must admit, very hard from such a view to form any idea of the true relations of the objects seen. But the sun, which rises and sets to the lunarians (if such beings exist) once a month, just as it does to us on the earth once a day, views the lunar craters and mountains in all their various aspects, and by the shadows it casts allows us to see the appearances they thus present. Nasmyth has taken advantage of this to form careful models of many of the craters, which, when compared with drawings made at the telescope, represent faithfully, under the same angle of illumination as the moon at the time of observation, not only the outlines, but the shadows of the lunar inequalities as cast by the sun. To any one acquainted with the telescopic aspect of the moon, the beautiful photographs from these models, given in the volume before us, are sufficient evidence of their general accuracy; but valuable as these photographs are, as the best representations of the moon's surface yet produced, the value of the models is far higher in enabling us to take up a different stand-point for the contemplation of the action of the lunar forces. There is another method, too, which may help us to the same result, and that is the method of analogy, of which the authors have made free use in this work; for there can be little doubt that the similar forms of craters on the earth and moon must have been produced by somewhat similar causes, and though on the earth we can examine our craters closely, we have not the advantage of looking down on them as in the case of the moon. It is evident, then, that a theory of the formation of lunar craters must throw much light on the history of their terrestrial brethren.

The question of the thickness of the present crust of the earth is implicitly involved in the discussion of volcanic action on the

moon, for we have not in the latter case the convenient force of steam to fall back upon in explanation of violent eruptions, so that it seems difficult to account for the lunar craters unless the crust was at the time of their formation very thin. The controversy on this point has passed through several phases, and the question must still be considered as very far from a solution from lack of the necessary experimental data. Starting from the assumption that the earth was once in a molten condition—an hypothesis which its spheroidal form and the increase of temperature as we get nearer the centre (as in descending a mine) fully justify—the question arises whether the exterior or interior will begin to solidify first. It is here necessary to correct a fallacy which has misled many—that the temperature increases uniformly in approaching the centre, and at the same rate as near the surface, so that the heat near the centre would be something enormous. We have every reason to suppose, as Sir W. Thomson has ably shown, that no portion of the earth was ever at a much higher temperature than 7,000° Fahrenheit, the fusing point of most rocks, and that from the known law of loss of heat in cooling, the temperature remains sensibly constant at all depths greater than about one-fortieth part of our distance from the centre, while it appears probable that a crust was formed about a hundred millions of years ago. It may be asked how it is possible that rocks should solidify in the interior at a temperature sufficient to melt them at the surface; the answer to which is that the enormous pressure to which they are subjected may raise the freezing point, and so allow rocks to solidify at a higher temperature than that corresponding to ordinary atmospheric pressure. But further experiments are required to settle a point like this.

It is a well-known fact that water expands on freezing, and it used to be supposed that this was a sort of special dispensation to prevent the whole surface of the globe becoming a mass of ice; but Nasmyth shows that this is equally a property of some other substances, as he has observed that cast iron, slag, and, what is still more important for the support of his theory, lava, when solid, float on the same substances in the molten state; and the same is true of bismuth, mercury, and silver. On the other hand, Bischof has found that granite, slate, and trachyte contract 20 per cent. in solidifying, which leaves us in an awkward dilemma between these two authorities. The bearing of these experiments on the question at issue may be readily seen. If the substances of which the earth is composed contract in freezing, the crust would immediately on its formation break up and sink in the lighter fluid, instead of forming a layer on the top, as ice does on water. But suppose the reverse is the case, as Nasmyth assumes, and that a thin crust is formed: it will go on increasing in thickness as the cooling process continues, and no arguments based on the original conditions can show that it is still thin at the present time, either in the case of the earth or the moon. Mr. Hopkins has, on the contrary, shown, from a considera-

tion of the contour of India, that if the crust be homogeneous, whether we suppose it heavier or lighter than the fluid interior, it must be at least 1,000 miles thick, in order to prevent the range of the Himalayas falling in (on the first supposition), or the dense fluid breaking through the bed of the Indian Ocean (on the second). But from observed deflections of the plumb-line at many places, both in India and elsewhere, it is clear that there is in some parts an excess, and in others a deficiency, of matter, which, of course, would vitiate any reasoning based on the supposition of a homogeneous crust, and there would therefore seem to be no objection, so far, to the hypothesis that the crust of the earth is something like a field of ice, in which the icebergs which rise above the upper surface (like mountains on the earth or moon) extend also below the under surface, and this assumption receives some confirmation from deflections of the plumb-line observed in India (on the Malabar and Coromandel coasts), which indicate greater attraction from the ocean than from the land, as if the denser fluid of the interior approached nearer the surface under the ocean, and so caused a greater attraction than under the elevated table-land of the Deccan. But there still remains this difficulty, that a tidal wave would be set up in the internal fluid by the action of the sun and moon, which would, if the crust were thin, cause a tide in the surface and a consequent decrease in the apparent height of the ocean tides, which is not borne out by observation, so that Sir W. Thomson concludes that the earth must be more rigid than a solid globe of glass of the same size. But it does not, by any means, follow that there may not be extensive lava pools or lakes bridged over by a comparatively thin crust, through which volcanic outbursts occasionally force their way. It would appear, however, from the connexion which seems to exist between the eruptions of the northern and southern volcanoes of Europe, that these lakes of lava must in some cases be of very considerable size. The subject is beset with difficulties whichever way we turn, and Mr. Nasmyth's theory has the great merit of giving a plausible explanation of the lunar features, even though it may require modification before it can be applied to the earth.

The first thing that strikes the student of the moon's surface is the enormous size and number of the lunar craters as compared with their fellows on the earth: a point well brought out in the book before us by a comparison of two photographs from models representing respectively Vesuvius with the Campi Phlegraei (probably the most volcanic region on the earth), and an equal area on the moon, containing several minute craters, near Theophilus. The craters in the two cases are about the same size in reality, but on the earth Vesuvius is a considerable volcano, whilst the lunar craters here represented are barely recognisable on the moon. This disproportion is readily explained by the authors, on the assumption that the volcanic force is greater on the moon than on the earth, while, as is well-known, the force of gravity is reduced

to one-sixth. Besides this, there is no atmosphere to diminish by its resistance the distance to which lava and scoriæ may be projected, so that there seems no reason, on the score of disproportion in size, for ascribing a different origin to the lunar and terrestrial volcanoes. There is one point of dissimilarity which the authors appear not to have taken sufficient account of, and that is the difference of form in the two cases. On the earth the volcanoes are elevations, but on the moon they are depressions, the floor of the crater being in the first case small and raised far above the general surface; while in the other it is usually as far below and of considerable size. There is, perhaps, no great difficulty in accounting for this, and, in fact, an explanation is given of how the two formations might arise; but the diverse conditions which must hold to produce such different results are not stated. There can be, however, but little doubt that a very great step has been made by Nasmyth's theory in dispensing with the agency of steam, and referring volcanic action to the force of expansion of matter in solidifying.

When a thin crust has been formed, the fluid beneath, in cooling, approaches the point of solidification, and therefore expands; but the crust, having already solidified, follows the normal law of contraction on cooling, so that the fluid cracks the crust and forces its way out, just as water bursts a bottle in freezing. This is the cause of the formation of volcanoes; but, to account for the upheaval of mountain chains, Nasmyth supposes that the crust afterwards becomes too large for the shrivelled globe, which gives rise to huge wrinkles or ridges. There appears here to be a flaw in the reasoning, but the point is really not material to the theory, which is sufficiently comprehensive without this addition. The process of formation of a lunar crater will best be given in our authors' own words, though for the diagrams, which form such an essential part of the explanation, we must refer the reader to the work itself.

"Under these circumstances, we conceive the upcasting and excavating of a normal lunar crater to have been primarily caused by a local manifestation of the force of expansion upon solidification of the subsurface matter of the moon resulting in the creation of a mere 'star' or crack in and through the outermost and solid crust. From the vent thus formed, we conceive the pent-up matter to have found its escape, not necessarily at a single outburst, but in all probability in a paroxysmal manner, as volcanic action manifests itself on our globe. The first outflow of molten material would probably produce no more than a mere hill or tumescence; and if the ejective force were small, this might increase to the magnitude of a mountain, by an exudative process, to be alluded to hereafter. But if the ejected force were violent, either at the moment of the first outburst, or at any subsequent paroxysm, the unsupported edges or lips of the vent-hole would be blown, and ground or fluxed away, and a funnel-formed cavity would be produced, the ejected matter (so much of it as in falling was not caught by the funnel) being deposited around the hollow, and forming an embryo circular mountain. The continuance of this action would be accompanied by an enlargement of the conical cavity or crater, not only by the outward rush of the violently discharged material, but also by the 'sweating' or grinding action of such of it as in descending

fell within the hollow. And at the same time that the crater enlarged, the rampart would extend its circumference, for it would be formed of such material as did not fall back again into the crater. So long as each succeeding paroxysm was greater than its predecessor, this excavating of the hollow and widening of its mouth and mound would be extended. But when a weaker outburst came, or when the energy of the last eruption died away, a process of slow piling up of matter close around the vent would ensue. It is obvious that when the ejective force could no longer exert itself to a great distance, it must merely have lifted its burden to the relieving vent and dropped it in the immediate neighbourhood. . . . And as the eruption died away, it would add little by little to the heap, each expiring effort leaving the out-given matter nearer the orifice, and thus building up the central cone that is so conspicuous a feature in terrestrial volcanoes, and which is also a marked one in a large proportion of the craters of the moon."

Having thus laid down the foundations of the theory, the authors proceed to explain, with more or less plausibility, the formation of chains of craters, of ring formations not manifestly volcanic, and of radiating cracks and bright streaks. The ring mountains or walled plains, some three hundred miles in diameter, have long been a puzzle to astronomers, and we are afraid they still remain so, notwithstanding the explanation here given, which strikes us as not a very happy one.

The first aim of geologists has been to arrange the strata of the earth in their chronological order, and we are glad to see an attempt made to do the same for the moon, though much must in this case be pure guesswork. Two guiding principles are, however, laid down by the authors, first, that a crater which overlaps another is the more recent of the two; and, second, that the brightest features were the latest formed. The latter statement appears open to the objection, that in the absence of an atmosphere there is nothing to dull the original brightness of any deposit; but the first principle alone leads to the important conclusions that the largest craters are also the oldest, and that the mountain chains are at least equally old. It is possible, too, that we may gain some information from a study of the colour of different parts of the moon's surface, since the variety of hue must, on any rational supposition, be due to the varying character of the surface rocks; but no observations of the slightest value have yet been made of this element, the unassisted eye being quite untrustworthy where colour is concerned.

As the moon has no appreciable atmosphere, it is exposed to the most violent alterations of heat and cold—from about 500° Fahrenheit to the temperature of space, 460° below Fahrenheit's zero (not 250°, as stated in the work before us). This must produce a disintegration of the surface, which would easily account for the alleged changes in the crater Linné if they were established, which is very far from being the case.

We have only noticed the portions of this valuable work which treat directly of the important theory set forth in it; the other chapters, though merely incidental to the subject-matter of the volume, have yet an important bearing on it in bringing out more clearly the conditions which obtain on our

mysterious satellite. Though popular in form, this book contains much food for thought for the scientific mind; but it is in such a digestible form that the general reader will find not the slightest difficulty in following the argument, whilst the perfectly unique illustrations which elucidate every point that arises will give him a vivid idea of the aspect of the moon, and of the forces which have been in action on its surface. There are a few errors of the press which might well be corrected in a second edition, which will, we trust, soon be called for.

W. H. M. CHRISTIE.

Records of the Past: being English Translations of the Assyrian and Egyptian Monuments. Published under the sanction of the Society of Biblical Archaeology. (London: Bagster & Sons, 1874.)

The publication of the *Records of the Past*, a series of English translations of Assyrian and Egyptian documents, will, it is to be hoped, tend powerfully towards the removal of a great amount of prejudice and misunderstanding as to the nature of Egyptology and Assyriology. These studies have been represented as consisting chiefly in the decipherment of supposed royal names, in the identification of these with names in the lists of Manetho or Berosus, and in the arbitrary manipulation of chronological data. Such fancies must be speedily dispelled by the translations now placed before the English reader. He will find in these texts a picture, deplorably imperfect no doubt, on account of its fragmentary condition, but absolutely true as far as it extends, of forms of civilisation really in existence many centuries anterior even to the fabulous periods of Greek and Roman history. These records of the past are of very various kinds. There is a very large number of historical documents, all of which have the advantage of being contemporary with the events which they record. How far they may legitimately claim to be considered as trustworthy is a question for the critical historian. Contemporaneous documents are not always veracious; but even as regards the early periods in question, it is sometimes possible to check one account by means of another. The number of religious and magical texts is also very large, and some of the texts are of considerable extent. Not a few of the religious texts are poetical; the remains of profane poetry are much less numerous. These, with two or three works of a didactic character, and several tales and fables, are, unfortunately, all that can at this moment be presented under the head of literature. Law reports, full of very curious details, deeds of sale and barter, registers, accounts, calendars, medical and other receipts, astronomical observations, and private letters on a great variety of subjects, furnish ample matter of study to the historian and archaeologist. Many new texts will certainly be added to the lists contained in the present volume. Since I drew up the Egyptian list, Dr. Ebers has described a medical papyrus of no less than a hundred and ten pages, which he is on the eve of publishing, and Mr. Goodwin has discovered and translated a papyrus containing a collection of poetical compositions strikingly analogous to portions of the Canticles and of the book of Ecclesiastes.

How far may the translations now offered be depended upon? The doubts which are likely to be felt upon this point are more likely to proceed from a general scepticism as to the possibility of deciphering and translating Egyptian or Assyrian texts, than from any uncertainty as to the comparative merits of this or that individual translator. But this general scepticism is at present very much more inexcusable than it may have been a few years ago. Many texts, both Egyptian and Assyrian, have now been published with interlinear

transcription and literal translation. The most determined sceptic will there find ocular demonstration of a definite unarbitrary method of reading, and of a not less definite grammar and vocabulary applicable to all texts of the same language. To perceive this requires no extraordinary amount of intelligence. It is as easy, even without the least knowledge of the methods by which scholars have succeeded in arriving at these results, as it is for a man to verify the results of an arithmetical problem which he has himself been unable to solve. The alphabet, grammar, and vocabulary constitute the key to a language, and each language can have but one such key.

An advertisement which appeared a short time before the present volume professed to give "a nearly perfect list of the materials which are extant for the reconstruction of Assyrian, Egyptian, and Hebrew History and Archaeology." This was certainly not quite correct, and readers of these volumes cannot fail to be disappointed if they expect from the translations of the historical documents named at p. 172 to be able to reconstruct Egyptian history, or even to acquire a faint conception of its duration. History cannot be dis severed from chronology, and the number of Egyptian monuments bearing upon chronology is simply enormous. There are between two or three hundred dated inscriptions for the twelfth dynasty alone. Out of a hundred and sixty-eight tablets in honour of one of the Apis Bulls, no fewer than fifty-three bear dates. An immense number of monuments which furnish the most certain and invaluable data to the historian are so mutilated as to baffle all attempts at a translation intelligible to those who are ignorant of the original. The triumphal tablets of Rameses II., on the cliffs near Beyrout, which are of immense historical importance, are illegible except as regards the dates which they bear. The history of the first six Egyptian dynasties has been reconstructed by M. de Rougé from a careful study of the monuments of this period. But the monuments, taken one by one without note or comment, would convey but little information to the uninitiated student. It is very doubtful whether even the great inscription of Una can be made intelligible without a commentary. Important portions of it cannot be translated because they have ceased to exist, and portions which do exist have no meaning because they want a context. Texts of this kind are best presented to the public by means of a calendar. It is quite certain that these records of the past will most efficiently supply the need they are intended to meet, if by the side of long and more or less complete texts, such as the annals of Thothmes III., Sennacherib, or Assurbanipal, a complete catalogue or calendar is given of all the known inscriptions which throw a light on the chronology and history of Egypt and Assyria. How far this is feasible for the Assyrian monuments, I will not venture to say; but as regards Egypt, the Museum catalogues of London, Paris, Berlin, Turin, and Bulaq, however imperfect, make the task a comparatively easy one. A great many monuments are still standing on the spot where they were first set up, and with reference to these we must have recourse to the great works of Champollion, Rosellini, Lepsius, Brugsch, Duemichen, and Mariette.

P. LE PAGE RENOUF.

REFORM IN THE UNIVERSITY OF DUBLIN.

THE discussion of last year in the House of Commons, and the abolition of tests in Trinity College, Dublin, are beginning to bear their natural fruits. Mr. Gladstone complained justly that a board of eight men, co-opted according to seniority, should rule absolutely the great University of Dublin, and it was understood that, even should his scheme not pass, some large reforms on this point were necessary. After a good deal of delay, chiefly caused by the junior fellows and professors rejecting some inadequate proposals of the Board,

but also by the slow action of a governing body chosen by seniority, we have at last a scheme put forth, apparently with the consent of all the working men who understood the requirements of the crisis, and which we trust will be accepted with little modification by the Senate.

It proposes to throw the main duties of government upon a new Academic Council, consisting of four members elected by the seven senior fellows, four elected by the twenty-eight junior fellows, four by the professors who are not fellows (about thirty), and four by the senate at large—a body embracing all the fellows and professors, together with about a hundred and thirty doctors and masters. Of these latter some are valuable resident teachers, some are rural clergymen, some are people who come there for want of other amusement, so that this body represents “the public,” as it is called, that many-headed monster which claims to control everything, but which can hardly be considered fit to legislate on the specialities of University life and teaching.

The Board, however, proposes to allow cumulative voting, so that the outsiders should have full power to have themselves represented on the Academic Council. The present Board also proposes to remain a sort of Upper House, controlling finance, and allowing itself a veto on the proposals of the Council.

This was the scheme partially discussed in the unfinished debate of the Senate. The results of this debate show that while the professors and junior fellows seem, on the whole, satisfied with the general scheme, of which the details are meant to be discussed by the new Council, the chief objections came from the outsiders in the Senate. Some of them, such as the vicar of Mullingar, professed to be able to produce a better scheme, and ultimately obtained an adjournment to the 18th of May for the purpose of doing so. It seems likely that the main difference in the principle of this expected scheme will be the separation of Trinity College and the University of Dublin, on the model of Oxford and Cambridge. The object in view appears to be the lowering of the position of the Fellows and Professors as compared with the Congregation of Doctors and Masters, who are supposed, owing to their long absence from the University (many of them even from town-life), to have got rid of those narrow prejudices which dim the judgment of the learned. But it is not safe to speculate more closely on this coming scheme, which will doubtless draw some of its features from Mr. Gladstone's celebrated proposal of last year.

On the part of the working men of the college, Dr. Salmon pointed out that Oxford and Cambridge, instead of being types, are anomalies in structure, differing from all the other great Universities of the world, where college and university are so fused as to be undistinguishable. This has hitherto been the case in Dublin, whose history is exactly paralleled by Harvard in the United States, where Cambridge University is so identified with its single college as to be inseparable from it. The Dublin fellows and professors seemed unanimous that this type is preferable, and Dr. Salmon even characterised as *rubbish* the attempt of lawyers to make out a distinction without a difference. According to the scheme of the Board, the new Council will govern both College and University, as its constitution implies; and, while the outsiders will have a voice in its debates, the weight of opinion will be that of men whose lives are devoted to the University's interests, and whose income depends upon its success. This is surely as it should be, and it is earnestly to be hoped that the Government will not sanction any scheme in opposition to the unanimous opinion of the working bees, even should it be carried by a small majority in a Senate of the country doctors and masters. The coming debate will, however, clear up many points, and perhaps a concession as to the mode of electing the representatives of the Senate, or of the veto still claimed by the Board, may bring into har-

mony all parties who are acting for the interests of the University.

There will always remain, especially in Ireland, some malcontents, either from disappointed ambition or from want of better occupation—perhaps even from the hope of obtaining some promotion by agitation—a very effectual method hitherto common in all Irish professions. But these parasites, like those which infest the domestic animals, are probably intended by a wise Providence to keep in activity bodies which suffer by too much rest, and therefore the University of Dublin should be very thankful for their existence.

We shall inform our readers of the progress of this important and interesting discussion.

NOTES AND NEWS.

THE lately published volume of the *Proceedings of the Royal Institution* during the past quarter contains a paper by Mr. Francis Galton upon “Men of Science, their Nature, and their Nurture.” It is an attempt, somewhat similar in method to the same gentleman's work on Hereditary Genius, to discover the general conditions upon which depends the growth of scientific talent. Mr. Galton deserves credit for the industry with which he has collected autobiographical facts of a private nature from more than 100 prominent Fellows of the Royal Society, to whom he addressed an elaborate series of questions; a mode of investigation evidently borrowed from the boudoir practice of keeping “confession albums.” From the answers received he proceeds to deduce his results, and thus arrives at certain conclusions with regard to the qualities of mind and body, and the sort of education, which are favourable to the development of scientific activity. The propositions he lays down are no doubt of considerable interest, though they do not much differ from what a person of ordinary information would have been disposed to anticipate. For example, we learn that mental energy and robust health are conditions favourable to scientific work; and that independence of character, tending to religious nonconformity and social radicalism, is very widely to be found among Mr. Galton's voluntary witnesses to their own qualities. It is perhaps somewhat more surprising that a large proportion of them confess to a deficiency in the purely emotional element, and in the desire to influence the beliefs of others. “All tends to show that the scientific mind is directed to facts and abstract theories, and not to persons and human interests.” “It is also strongly anti-feminine.” From these facts, if they are indeed facts, Mr. Galton draws the conclusion that these qualities of the average man of science should be “rigorously” inculcated in the rising generation; apparently shutting his eyes to what will to others be transparently clear, that many of his general truths are merely accidents of the unfortunate position of neglect into which science had fallen in England, and especially in the universities, when his picked men of science were young, and that academical culture rather than closer study of some special department of inanimate nature is required to remove some of the less amiable characteristics to which Englishmen of science at the present day have admitted themselves to be disposed.

It is more important to draw attention to the inherent weakness of the method which Mr. Galton has adopted, and to protest against the assumption that laws of any scientific precision, or rules of much practical use, can be obtained in this simple fashion. Mr. Galton would seem to be unaware of the peculiar dangers to which inferences drawn from the mere collection of statistics are exposed. He has merely formed an enumeration of affirmative instances; and has not extended his field of enquiry to men of science of other times, and in other countries. Moreover, the observations which he has made are not colourless, but all manifestly tinged by the partiality which must affect the opinions of a limited number of men when speaking of themselves. In addition to other sources

of error, inferences based upon statistics must always be misleading, unless the enumeration of instances be so vast as to eliminate minor causes of disturbance, or the registration of the facts be carried on by some self-acting machinery, of which the trustworthiness is above suspicion. Mr. Galton's paper, though in many respects curious and suggestive, discloses a fatal tendency to disregard the approved maxims of inductive enquiry, and to theorise upon insufficient data; while he imagines that he can deduce mathematical measurements from such crude observations into moral qualities.

Bulletin of the United States Geological and Geographical Survey of the Territories. No. 1.—This number relates to Northern Colorado, and the most generally interesting portions relate to the mammalian fossils from the Pliocene strata. Mr. Cope, the author of the report, observes that the most important palaeontological results are:—1. The discovery that the camels of this period possessed a full series of upper incisor teeth. 2. That the horses of the genus *protophippus* are, like those of *hippotherium*, three-toed. 3. That a mastodon of the *M. Ohioticus* type existed during the same period. Mr. Cope was fortunate enough to dig out from a bluff, with his own hands, a nearly complete skeleton of *Protophippus sejunctus*, a new species, with tridactyle feet like *hippotherium*. The skeleton is remarkable for the disproportionately large size of the cervical as compared with the dorsal vertebrae. The large size of the head, compared with the rest of the animal, was supplemented by the length and slenderness of the limbs, which considerably exceeded the “proportions ever known in the existing horse.”

Flint Implements in America.—The *Bulletin of the Essex Institute* contains several papers by Mr. F. W. Putnam, on stone implements found in New Hampshire, Massachusetts. One from Kingston, N. H., is a knife of red slate, above seven inches long, with a curved cutting edge, and with a stout back carved into a series of uneven knobs, giving firmness to the hold when grasped with the hand. A still more interesting relic figured in the *Bulletin*, was found at Seabrook, N. H., and is supposed to have been a totem. It is carved from a piece of syenitic rock into a rude but effective resemblance of a Beluga, or porpoise, and the tail is perforated, as if for suspension, but it is considered too heavy to have been a personal ornament. It is ten inches long, about two inches wide, and about two inches deep. Mr. Putnam likewise describes and figures a curious oval knife of talcose slate found in Putnamville (co. Essex). It is slightly over five inches long, worked to a rounded point at each end, and having the back ground to a thin edge. It is perforated with three rudely cut holes apparently made by scooping backwards and forwards with a pointed stone on both sides, and evidently intended as a means of fastening it to a handle.

Mr. WILSON (geologist) has recently sent to W. Bollaert, Esq., some highly curious arrow-heads and chippings from a kitchen-midden in Ecuador, near the coast. They are formed of a substance like Brazil pebble, and some of amethyst quartz.

Poisonous Effects of Thallium.—We learn from the *Bulletin des Sciences* that M. Raboteau, writing to the Société de Biologie de Paris, does not admit that M. Grandea's experiments with the salts of thallium, which seemed to show them to be more poisonous than those of lead, contradict his statement that a metal is poisonous in proportion as its atomic weight is high. He affirms as the result of fresh investigation, that the salts of thallium are not really more poisonous than lead salts, but act more rapidly from their greater diffusibility.

Poison of Fly Agaric.—M. Prévost has been experimenting on a new poison extracted by Schmidberg from the fly agaric (*Agaricus*, or *Amanita muscaria*). It belongs, not to the alkaloids but

to the glucose bodies, and a dose of a milligramme was found to arrest the contraction of the heart in dogs and rabbits. It also excites lachrymal and salivary secretions. The fly agaric is used by Kantschatdales for purposes of intoxication, but is described as poisonous by fungologists. Dr. Boham, cited by Berkeley, mentions a case in which small portions were eaten, and produced no other effect than temporary intoxication. The poison from it is called muscarine. Atropine is said to exert an opposite action on the heart, and also eserine.

THE Report made by Mr. Douglass, Engineer of the Corporation of the Trinity House, to the Office of Works, on the comparative merits of the signal lights used on the clock tower of the Houses of Parliament during the session of 1873, has just been published amongst the parliamentary papers. After giving a complete account of the different experiments made by him, Mr. Douglass states his opinion that, by adopting the electric light as a standard of intensity and cost, there is shown a superiority over the gas in intensity of 65·2 per cent., when using one 108-jet burner, and 27·1 per cent., when using three 108-jet burners; a saving in cost is also effected. The trifling gas light actually represents the maximum power obtainable at present by gas; but the power of increase capable in the electric light by the adoption of two electro-magneto machines has yet to be determined. By having the machine and lamp in duplicate, this light can be doubled in intensity, at trifling additional cost, during evenings in which the atmosphere is found to be so thick as to impair its efficiency. In proof of this powerful illuminant being perfectly trustworthy, if worked by careful attendants, Mr. Douglass instances the electric light at the Souther Point lighthouse, on the coast of Durham. This light had, at the time this report was made, been exhibited two years and a half, and had never been known to fail one minute.

DR. WENSKY, who had already attracted to himself the favourable notice of scientific men by the admirable manner in which he arranged the mineralogical cabinet of the Breslau University, has had the honourable distinction conferred upon him of being appointed successor to the great chemist Rose, at the University of Berlin.

AN earthquake was felt at Framersheim, in the Rhineland, on the 15th of last month, and was remarkable for the loud noise with which it was accompanied; while, as far as can be ascertained, no other spot on the earth's surface was visited at the same period by magnetic disturbance. The shock was felt at Framersheim between two and three in the morning, and was manifested by repeated movements of the earth, simultaneous in their occurrence, with noises that seemed to the startled listeners to be similar in sound to the rapid movement of heavily laden trains passing from east to west.

DR. PEEZ draws attention in the *Allgemeine Zeitung* to a passage in Strabo (vii. 5) which he thinks seems to imply that the ancients had to combat the inroads made on the vine by the insect to which the name of *Phylloxera* is now applied. According to Strabo, as quoted by Dr. Peetz, the vine-cultivators of Seleucia were forced to protect their plants against the attack of the vine-louse, by encircling and painting the stems with a thick layer of an asphalt-like earth, which they dug up from the volcanic rocks on which their vineyards were planted. This earth was well kneaded with oil prior to its application to the plants, and its effect was to kill the insect before it could ascend to the leaf and fruit-buds. The same kind of earth is said to have been found at Rhodes, and near Polina in Dalmatia, but it was less oleaginous than that procured at Seleucia, and consequently required to be more copiously mixed with oil. Dr. Peetz asks whether it might not be advisable to try the effect of asphalt, or of some of the numerous forms of petroleum or rock-

oils with which we are now so familiar in killing the *Phylloxera* before it ascends from the crown of the root to the higher parts of the vine. He thinks the experiment is worthy the attention of the vine-growers; and the simplicity of the method certainly seems to favour its being tried.

A CURIOUS invention is reported from Cologne, where, at the last of the admirable popular lectures, which have formed so marked a feature in this spring's programme for the instruction of the masses in the Rhenish capital, an instrument was shown by the lecturer, Professor Amberg, which is able to imitate the human voice. By this ingenious invention, to which the ambitious name *vox humana* has been given, all the vowel-sounds and the labials can be rendered with perfect clearness and accuracy; it also gives some of the gutturals, but as yet the instrument has not succeeded in rendering the hissing or the deeper laryngeal sounds.

THE German chemist, Herr Foelix, has drawn the attention of his vine-growing neighbours in the Rhineland to the questionable practice, so common in that part of Germany, of letting the vines bleed profusely by cutting them late in the spring. He very aptly suggests that as the sap is the life and essence of the vine, it must surely impoverish the subsequent fruit to withdraw large quantities of its natural substance. He has observed as much as one litre of sap flow from a vine in the course of one day after it had been cut; and on analysing some of the fluid obtained by this bleeding process, he found that it contained traces of potash, lime, sulphuric and phosphoric acid, with an appreciable quantity of organic and inorganic matters, the former of which included nitrogenous bodies. To bring his observations to a practical test, Herr Foelix last year caused half the vines in a large vineyard to be cut in the beginning of January, while the cutting of the remainder was not effected, owing in part to bad weather, till April. In the former, scarcely any sap had escaped, as the wounds closed over before it began to rise, but in the case of the latter there had been great loss from bleeding. The difference between the two halves of the vineyard was very strikingly manifested in the course of the season. The vines cut in January were more luxuriant than the others both in leaf and wood, while the grapes were larger, and ripened ten days sooner.

MR. ALFRED SELWYN, the Director of the Geological Survey of Canada, has issued his *Report of Progress for 1872-73*, which forms a handsome volume of 300 pages. The Survey Office has also printed Principal Dawson's *Report on the Fossil Plants of the Lower Carboniferous and Millstone Grit Formations of Canada*, which forms a sequel to his former *Report on the Flora of the Devonian and Upper Silurian*.

ON Saturday, May 2, a party of two hundred ladies and gentlemen visited Messrs. Siemens's works at Woolwich, and went on board the *Faraday*, a new vessel constructed expressly for the purpose of laying electric telegraph cables. The party were also shown the entire process of cable manufacture.

M^{ME}. C. COIGNET contributes an interesting article to the *Revue Politique et Littéraire* (May 2), on the "Social Movement in England for the Political Enfranchisement of Women."

THE International Congress of Orientalists will meet this year in London, from September 14 to 19. International meetings of scientific societies have been held during the last ten years in almost every one of the great capitals of Europe—in Paris, Rome, Vienna, Berlin, Stockholm, and Copenhagen; and, though London is in many respects an inconvenient place for a social gathering of *savants* from all parts of Europe, it was fixed upon at the meeting of the Congress of Orientalists at Paris last year, and great exertions

will have to be made in order not to disappoint our foreign visitors. In France, Germany, and Italy the Government invariably lends a helping hand. It places the necessary rooms at the disposal of the meeting, arranges social entertainments, and renders all public galleries and institutions more readily accessible. The municipal authorities, too, of the town in which the meeting takes place generally exert themselves to provide for the comfort and amusement of their foreign guests. The king, or members of the royal family, invariably extend their patronage to these meetings. All this will be impossible in London. It is to be hoped, however, that private exertions will supply everything that is really wanted for the success of a scientific meeting. There is reason to suppose that the Indian Government will show that it is not unmindful of the services of those who devote their time and leisure to the elucidation of the literature, antiquities, laws and religions of the East. An exhibition of the most important treasures of the East India Museum in a place more accessible than the present *piombi*, has been suggested. The Secretary of State for India may be trusted to do all that can be done in accordance with official usage.

A committee has been formed, chiefly under the auspices of members of the Royal Asiatic Society, to receive the foreign *savants*. Six sections have been formed:—

1. Aryan Section—President, Professor Max Müller.
2. Semitic Section—President, Sir Henry Rawlinson, K.C.B.
3. Turanian Section—President, Sir Rutherford Alcock, K.C.B.
4. Hamitic Section—President, Dr. Birch, LL.D.
5. Archaeological Section—President, M. E. Grant Duff, Esq., M.P.
6. Ethnological Section—President, Professor R. Owen, C.B.

Dr. Birch will act as President of the Congress.

Papers will be read, and points of interest will form the subject of discussion. Some of the mornings will be devoted to visiting public and private collections of Oriental objects, whether books or works of art. Among the supporters of the meeting we see the names of the Duke of Argyll, Archdeacon Bickersteth, Jos. Bonomi, E. de Bunsen, Bishop Callaway, Professor Cowell, W. H. Dixon, Sir Bartle Frere, A. H. Layard, W. Ralston, Dr. Rien, Dr. Rost, the Dean of Westminster, Sir Charles Trevelyan, Professor W. Wright, &c. Tickets conferring the rights of membership may be obtained for 10s. from the honorary secretary, Professor Douglas, British Museum.

WE hear that it is to be proposed, in a convocation to be held at Oxford on May 21, to confer the honorary degree of Master of Arts upon Dr. Richard Morris, in consideration of his services to English philology, by his numerous editions of MSS. for the Early English Text Society, and of his work done for the University Press, as editor of several valuable books in the Clarendon Series.

A REFERENCE to the sacrifice of Isaac has been discovered in the Assyrian tablets. Bel is represented as the sacrificer, just as the Phœnician Kronos, according to Sanchuniathon, offered up only son Jeûd. The event is assigned to the vernal equinox, when the sun passed into the first sign of the Zodiac, Aries.

WE are informed by Signor D. Campanari that the dice inscribed with Etruscan letters, which have lately attracted so much attention, were originally discovered by the Princess of Canino, Donna Alessandrina Bleschamps-Bonaparte, while making excavations in 1846 or 1847. Signor D. Campanari and his brother obtained possession of them in January 1848. The former brought them to London in February 1848, and sold them, in 1856, to the late Duc de Luynes, in whose collection they ought still to be found at Paris.

Signor D. Campanari also calls our attention to

some papers published by his brother in the *Giornale Arcadico Romano*, vol. cxxiii., 1851, containing, among other things, a complete translation of the long Etruscan inscription of the *Cippus Perusinus*. The system of interpretation he follows is, in the main, that of Lanzi in the *Saggio di Lingua Etrusca*, 1789.

DR. WILHELM WAGNER, the editor of the *Aulularia*, &c., who also edited a volume of mediæval Greek texts for the (London) Philological Society, and has published others elsewhere, has been elected an honorary member of the Greek Philological Society at Constantinople.

PROFESSOR E. B. COWELL has been elected a Fellow of Corpus at Cambridge. No one was more worthy of such a distinction than the Cambridge Professor of Sanskrit. Ever since his appointment as Professor of Sanskrit and Comparative Philology, he has been indefatigable both as a professor and a tutor, devoting all his time and energy to the practical teaching of Sanskrit and the modern vernaculars of India, and sacrificing his own literary work to the interests of the University. Professor Cowell is *facile princeps* among English Sanskrit scholars. To say nothing of his other works, his edition and translation of the *Kusumanjali*, or the Hindu Proof of the Existence of a Supreme Being, have been recognised as a masterpiece by all competent judges. The materials which he has collected for an exhaustive treatment of Hindu Philosophy are known to be most important, and it is to be hoped that he may soon find the necessary leisure for finishing the labours which he began many years ago during his residence in India. Corpus may indeed be congratulated on its new fellow, not only on account of his scholarship, but of his sterling character and true charm of manner.

THE second number of *Hermathena*, which made so favourable an impression last year, is in the press, and may be expected in the course of next month. It will exceed in length the first number, and will contain, among other varieties, two Virgilian articles from the pen of Dr. James Henry, papers on Campbell's *Sophocles* by Mr. Davies, on the *Philebus* by Dr. Maguire, on the Present State of Greek Etymology in England by Professor Ingram, &c., &c. There is no better evidence of the sort of work done in Trinity College, Dublin, than a publication of this nature.

MEETINGS OF SOCIETIES.

SOCIETY OF ARTS (Tuesday, April 28).

AN interesting paper was read by Col. J. C. Gawler, on the history, progress, trade, and prospects of South Africa.

In referring to the Cape Colony, the lecturer pointed out that it had been ours since 1806 only. Until 1833 slavery was rife there, the slaves being composed, for the main part, of Hottentots and Malays, whom the Dutch had imported from Java, Sumatra, &c. In 1849 trade was beginning to flourish, but three Kafir wars in the space of twenty years, drought, horse and cattle sickness, and other calamities, proved most threatening for the future of the colony. The abolition of slavery in 1833 caused the emigration of over 1,500 Dutch farmers, who crossed the boundary (the Orange river), and took their slaves with them. They attempted to settle in Natal, but were forced to retire inland and northwards, displacing as they did so, the natives of Matabili, the country between the Limpopo and Zambesi. There they settled and formed the Transvaal Republic. Owing to the encroachments of the Boers the long strip of country between the Drakensberg mountains and the sea was offered to the Natal Government by the Zulus, but Lord Kimberley, it is said, discountenanced the proposal. Now this land is all in the possession of the Boers. In 1871 4,000 women and children were sold into slavery in the Transvaal, and far and wide all the tribes were imploring the British Government to take them over. Two of these

tribes, the Basutos and the Griquas, were annexed, but to the more northerly tribes a deaf ear was turned. Colonel Gawler here insisted strenuously on the duty of the mother country to place an accredited British agent in the Transvaal republic, whose duty it would be to protect the natives who have been endangered by the policy of the Home Government.

The Portuguese and Dutch, who will probably play into each other's hands as far as slavery is concerned, are now uniting Delagoa Bay and Lydenburg by a road.

The Orange River sovereignty was established in 1851, but in 1854, in accordance with the recommendation of three English commissioners, it was handed over to its inhabitants, who formed a Free State. The latter is rich in diamonds, and the Transvaal in gold, lead and copper. Both offer splendid advantages to farmers.

Natal is semi-tropical near the coast, and produces sugar-cane, indigo, arrow-root, cotton, ginger, and coffee. Inland there are many farms; but bridges are much wanted for purposes of communication. It is a great mistake, the lecturer insisted, to allow the Kaffirs to settle in Natal, under conditions which make them a completely useless community.

Besides some smaller lines, a great central line of railway is to run from Port Elizabeth through the centre of the Free State and Transvaal, with a branch to Delagoa Bay, and the main line may eventually bifurcate to the Zambesi mouth and St. Paul de Loanda. The gold which exists in the region between the Limpopo and Zambesi will prove a source of great wealth, while in metals and other products it is also extremely rich. A British settlement on the Zambesi would enable us to develop the resources of the country, and to form a South African Confederation, which would be the best organization for the management of the Cape Colony, Natal, and the two Republics.

PHILOLOGICAL SOCIETY (Friday, May 1).

MR. H. SWEET read his third and concluding paper on the History of English Vowel-sounds, in which he treated of the special changes of the modern period, which he subdivided into five lesser periods:—

1. The Earliest period (1450–1500, or rather later), which differs from the Late Middle English of Chaucer only in the loss of the final *e*.

2. The Early period (comprising the Elizabethan age), characterised by the diphthongisation of *ii* and *uu* into *ei* and *ou*, and the raising of *ee* and *oo* to the high positions of *i* and *u*.

3. The Transition period (1650–1700), to which belong the peculiar modern *æ* (as in *man*) and *r* (as in *but*) from *a* and *u*, the simplification of *ai* and *au* into *e* and *o* (although this change was already partially developed into the Early period), and the resolution of *yy* into *i*.

4. The Late period (1700–1800), in which the broad long vowels of the previous period were narrowed, *ææ* from *aa* (as in *taal*, written *tale*) passing through *èè* into *éé*, and the *éé* of the Early period (as in *dréem*, written *dream*) becoming *ii*.

5. The Latest period, characterised by its remarkable tendency to diphthongise the long vowels, especially *éé* and *oo*, which are in the present generation almost always *ei* and *ou*.

Although the result of Mr. Sweet's method was in almost all cases to confirm the results obtained by Mr. Ellis from his examination of the evidence afforded by the phonetic treatises of the Modern period, there were naturally some points of difference. The most important was Mr. Sweet's view that the short *y* sound was still retained in the Modern period in such words as *busy*, *build* (Old English *bysig*, *byldan*).

A considerable portion of the paper was taken up with the details of Mr. Sweet's observations on the remarkable varieties of pronunciation in process of formation, which, owing to the want of cultivation of the observing faculties among

our philologists, have hitherto been almost entirely ignored. Mr. Sweet insisted strongly on the great importance of taking accurate observations of these nascent pronunciations, which are calculated to throw great light on many obscure linguistic problems.

ARCHAEOLOGICAL INSTITUTE (Friday, May 1).

MR. SODEN SMITH read a paper on "Specimens of Wrought Gold forming part of the Ashantee Indemnity." Mr. Soden Smith divides these curious specimens of native gold-work into two classes. 1. Those made in direct imitation of natural objects. 2. Those copied from artificial and European models. Of the first class, the most remarkable are the human heads, one of which is nearly life size. In the character of the physiognomy, especially in the lines of the mouth and the conventional treatment of the beard, this largest head is thought by Mr. Soden Smith to closely resemble ancient Egyptian; indeed, he considers that the influence of Egypt is distinctly perceptible in Ashantee work, though more remotely than in most other countries whose art is derived from that great teacher of nations. The processes now in use among the Ashantees are for the most part traditional. The existence of such traditions among workers in precious metals is so durable, that it often carries us back to the remotest antiquity, while the traditions themselves are so widely spread that it is sometimes impossible to trace them to their original source.

Many indications, however, lead to the conjecture that an influence originating in the east of Africa, in Egypt and Abyssinia, may be recognised in the processes, and in many of the designs of the Ashantees, although of course their semi-barbaric work is not nearly equal in skill to that of the ancient Egyptians, whose knowledge of metal working and surface chasing has never been surpassed. In casting, the Ashantees display great skill, although probably their appliances are of the most simple kind. Among their most effective ornaments are certain disks, which were originally made of delicate wire coiled round and soldered together, but they now appear unable to effect this process, and therefore make a cast to imitate most skilfully the original work. The same imitation of older and more artistic work may be found in some of the beautiful little casts of cowrie shells, which are copies of models originally wrought in wire-work in a most complicated and curious manner.

All this would seem to point to the conclusion that the Ashantees were formerly more civilised, or at all events more skilful, than at the present day; that they have lapsed from high estate, rather than progressed from low. Mr. Soden Smith did not certainly draw this conclusion, but his remarks on their "lost processes," and "obscured traditions" plainly suggest it. It should be remembered, however, that much of our modern European work is done by mechanical processes in imitation of older artistic work. The production by means of casting of skilful copies of wrought works would seem, indeed, however much it may be deplored from an artistic point of view, to be rather an evidence of the progress than of the retrogression of a nation. The process of soldering does not seem to be employed by the Ashantees at the present time, but they have a most ingenious method of welding together portions of gold, which is skilfully applied.

The resemblance that has been pointed out between Ashantee work and that of the Celtic and Scandinavian tribes, Mr. Soden Smith considers to be only superficial, and common to all tribes that have wrought in the precious metals during their period of semi-barbarism.

LONDON ANTHROPOLOGICAL SOCIETY (Tuesday, May 5).

THE following papers were read:—1. "On Pasi-graphy," by Dr. Anton Bachmaier, President of the Central Pasiographical Society of Munich.

The object of the science in question is to place all nations in written communication with each other by means of numbers, which convey the same ideas in all languages; and thus "reunite peoples who are separated by a variety of tongues." The author suggested a new and convenient grammar, which might be rendered intelligible to the natives of any country, and a system of transliteration by which even Chinese and Japanese can be written in English characters. The President analysed and fully explained the grammar of pasigraphy. 2. "Kentish Group of Rude Stone Monuments," by Mr. A. L. Lewis, Hon. Sec. L.A.S. The author described and exhibited a diagram of a curious monument in Kent, which had not before been brought to the notice of the archaeological world. It consists of a circle and a sepulchral dolmen in close contiguity, but independent of each other. Mr. Lewis also described the better known monuments of Kent, and the objects for which they were probably constructed. 3. "Oxfordshire Group of Rude Stone Monuments," by Mr. A. L. Lewis, being a description of the Roll Rich, Hoarstone, and Five Knights, which he considers to have been places of sacrifice of Celtic origin. The President proved that the supposed connexion between the Roll Rich and Rollo neither agreed with the *locus in quo* nor the *tempus in quo*, the engagement between the Danes and Saxons at Hogsorton having taken place in 917; that of Sherston, in Wilts, a hundred years; later whereas, according to the Saxon annals, Rollo made inroads into Normandy in 876, which was not long after he had invaded England; that the probable meaning of the appellation Roll Rich is "circle of the Druids;" but that the name might also be derived from that of the village, viz., from Rollendri, "the dwelling of or near the circle." Godfrey Higgins connects the sixty stones with the Oriental cycle of Vrihaspati.

ROYAL MICROSCOPICAL SOCIETY (May 6, 1874).

A PAPER by Dr. Anthony, F.R.M.S., described some minute structures in the proboscis of the blow-fly which he did not find had been studied by other observers, and which he regarded as suckers. The paper was accompanied by elaborate drawings.

Mr. Slack read a paper on "Certain Beaded Silica Films artificially produced," which differed from Max Schultze's artificial diatoms. The latter were formed by allowing hydro-silicic fluoride gas to come into contact with filaments of cotton moistened with water. The silica was deposited in vesicles, the walls of which exhibited various diatom patterns. When the gas was passed through water, the silica deposit was in angular amorphous particles usually full of flaws; but, by mixing glycerine with the water, the reaction appeared to be slightly retarded and regulated, and films were obtained composed of innumerable beads, mostly from $\frac{1}{100,000}$ to $\frac{1}{50,000}$ of an inch or less in diameter. In many films the layer of beads exhibited approximations to organic cellular forms, and to forms like Bacteria and minute fungi. The appearance of these films, when highly magnified, shown with a double ground illumination, was extremely beautiful; the thicker ones looking like point lace, and the thinnest presenting an astronomical aspect, like nebulae or portions of the Milky Way as seen through a telescope. The various aspects and optical properties of the films and spherules were described, and it was suggested that when the silica was deposited in amorphous particles, there was a violent and unregulated rush of molecules from the gaseous to the solid state, that the action of the glycerine was to retard the process and give time for more regular formations. With rhythmical retardations of crystalline or other forces, it was easy to conceive organic patterns might be built up; and colloid bodies seemed to have this effect.

ROYAL INSTITUTION (Friday, May 8).

MR. SEDLEY TAYLOR lectured on "An Historical Enigma in the Trial of Galileo before the Inquisition."

The lecturer began by remarking that historians of the most opposite theological sympathies were practically agreed that the Inquisition had a clear legal right to call the Florentine philosopher to account, and to punish him for the line of conduct he had pursued. Nevertheless, in spite of this imposing unanimity of opinion, he hoped to succeed in showing that the present state of the evidence required this conclusion to be abandoned, and replaced by an unconditional verdict of "not guilty" on both the main counts of the indictment. After a rapid sketch of Galileo's early career, the circumstances which caused him to be denounced to the Inquisition, and thus produced the celebrated Decree of the Index Congregation against the Copernican theory, were examined in detail, and the exact scope of the Decree carefully ascertained and defined. A brief characterisation of the *Dialogue on the Ptolemaic and Copernican Systems*, the publication of which, in 1632, led to Galileo's being cited before the Inquisition, came next, and was followed by a précis of the ensuing trial. The grounds of the condemnation pronounced on June 22, 1633, were shown to be reducible to two, viz.:—

1. That the *Dialogue* transgressed the enactments of the Index Decree.

2. That it violated a positive injunction of the Tribunal, *not to teach the doctrine of the earth's motion in any manner whatever*, which the Court affirmed to have been personally delivered to Galileo on February 26, 1616, by the Commissary-General of the Holy Office.

With respect to the first of these allegations, Mr. Taylor argued that it could be completely rebutted by a reference to the Decree itself, and to other notorious and indisputable facts. The second head of accusation could not be dealt with thus summarily, and was, he admitted, a far more serious matter. Its validity entirely depended on the *actual delivery to Galileo* of the Commissary's message. This had been taken for granted, on the statement of the Court, as an undoubted fact, by every succeeding historian, even by those who habitually entertained towards the Inquisition feelings of the most profound distrust. Accordingly, the "Precept of 1616" played the leading part, as an unquestionable historical event, in every published account of the trial, though in reality destitute of any guarantee of its truth, save the bare assertion of the tribunal. Coming now to his main thesis, the lecturer pointed out that there lay on the very face of the sentence a glaring contradiction between two statements of the Court, of such a kind as to expose the reality of the event on which everything depended—the delivery of the Precept of 1616—to the gravest suspicions. It was this contradiction which, involving, as it did, the whole proceedings of the case in the most perplexing confusion and entanglement, he had ventured to call the "Enigma" in Galileo's trial. After describing the publication of new documentary evidence by Monsignore Marini in 1850, by M. de l'Épinois in 1867, and by Professor Gherardi in 1870, Mr. Taylor stated that the last-mentioned year saw the appearance of an extraordinarily able pamphlet by a German, Herr Emil Wohlwill, of Hamburg, in which the Enigma was for the first time clearly recognised and accurately described, the bearing of De l'Épinois' new evidence upon it pointed out, and a probable solution of the problem put forth. The lecturer then proceeded to sketch out the evidence on which Wohlwill maintained that the statement of the Inquisition as to the Precept of 1616 was false—that Galileo never received any injunction going beyond the requirements of the Index Decree—and that, consequently, the entry in the records of the Holy Office, on which the Court relied as authenticating their assertion, must be pronounced

to have been a *fraudulent fabrication* perpetrated in order to procure the conviction and condemnation of an innocent man. In support of this position Mr. Taylor adduced various official documents, the asseverations of the accused during his trial, and a number of extracts from Galileo's correspondence, on which last especially it was contended that the conduct of the writer, and of everybody else concerned, was utterly inexplicable except on the supposition which formed the basis of Wohlwill's theory. In conclusion, Mr. Taylor remarked that in the production of fresh evidence lay the only hope of dispelling the obscurity which still hung about the Enigma of the trial; and appealed to the Roman authorities, in whose custody such evidence was known to exist, no longer to withhold it, but, by publishing fac-similes of all the Galileo documents in their possession, to do what was in their power towards setting this question, now that it had once been mooted, finally at rest.

FINE ART.

THE SALON OF 1874.

Paris : May 1, 1874.

THE Salon of 1874 opened its doors to the public this morning in its usual quarters at the Palace of Industry in the Champs Elysées. The Salon is an official exhibition. But we must not conclude from thence that the whole movement of French art can be traced in it; this year we must even take into account some private exhibitions, an entire novelty, and a symptom of emancipation. But allowance must be made for our established habits of centralisation. They have enervated our characters, and rendered independent manifestations very difficult. The State in France has its schools, its traditions, its taste, its pupils, its professors, and even its critics. It is they who directly or indirectly control, if not art, at least the majority of those who practise it. Therefore it is that our official salons possess such great importance. It is there that rising artists bring themselves before the eyes of the mass of the public, and win rewards, reputation, fortune. Till the time when republican manners shall have triumphed over these monarchical doctrines, we must needs submit to their yoke.

One of the most faulty conditions of this Salon is, the obligation to submit to the examination of a jury nominated, not by the majority of the artists exhibiting, that is, by universal suffrage, but by a select body composed of members of the Institute, artists who have won decorations or medals, and pupils of the School of Rome. This odious regulation, which gives up the fame and fortune of artists to the Institute and its pupils, or to artists with more money than talent, was made by M. Charles Blanc, brother of the republican Louis Blanc, who was appointed Director of the Fine Arts by Jules Simon. This M. Charles Blanc, who became a member of the Institute in virtue of his ingenious but feeble writings, marked his term of office by the most reactionary measures, which his successor, M. de Chennevières, has not had the courage to wholly abolish. Still he immediately stopped the ruinous expenditure of the Musée des Copies, he restored to artists the room taken up by these deplorable copies, ordered indiscriminately and at hap-hazard, and he has authorised exhibitors this year to send three pictures instead of two. The result is that the Salon contains 3,657 works instead of 2,142, and—what is of far more importance than mere number—three works by real artists instead of two, a great gain both for the painter and the public. M. de Chennevières had the misfortune to owe his appointment to the clericals, the provisional rulers of France; but, apart from his political views, he is a laborious man, thoroughly acquainted with the history of French art; since the age of twenty he has been concerned in the management of exhibitions, and he loyally re-

cognises the danger of aspiring to *direct* the Fine Arts. The present Salon is the last which will be under State control. Its successors will be managed by the general body of artists, who will be organised, at their own risk and peril, into a vast National Academy.

I can to-day give you but general impressions. They are very favourable. The Academicians, who with us represent nullity, reaction, and the insolence of fortune, are vanquished all along the line. The dealers themselves desert them. M. Alexandre Cabanel exhibits two female portraits, that of Madame la Duchesse de Luynes, with her children, and that of Madame Wells de la Valette, daughter of M. Rouher. They are like dolls stuffed with bran. The least intelligent and least critical visitors pass before them with icy indifference. M. Gérôme, a painter of European reputation, has chosen as the subjects of his pleasant historical personages: Frederick the Great playing on the flute at Potsdam; Frère Joseph, Richelieu's confessor, descending a staircase and striking the courtiers with alarm; Corneille and Racine, working jointly at the ballet of *Psyche*. He has failed shamefully in sentiment, while preserving quality, composition, and detail.

The movement of our art is not to be found here. It would have shown itself more freely if Charles Blanc's regulation had not shackled it, had not been a powerful weapon in the hands of the Institute, of its pupils and its clients. Some old artists, Corot and Daubigny, for instance, are excellent this year; they have been inspired with new ardour. Their landscapes are very superior in force to their contributions of late years. But the young artists above all attract and retain public attention. It is a radical defeat for the old parties; a quiet, noiseless defeat, without shedding of tears, without exaggeration. For though the average of this Salon is good, it yet includes no very startling work. M. Edouard Manet, who is, without being the head of the young school, its most prominent member, had sent in three pictures. The jury accepted the least important of the three, a young mother and her little daughter watching a train passing; it rejected the other two, of which one, the green-room at the Opera, was a most elaborate work, and thoroughly Parisian.

M. Carolus Duran has a mediocre figure-study, but also two portraits which are thoroughly successful; those of his grand-daughter and of Madame de Pourtalès. Since the name of a lady of the ex-Imperial court has escaped my pen, let me add that the Bonapartists had counted on a success when they ordered of M. Lefèvre the portrait of the young cadet of Woolwich. Their hope has been disappointed. The portrait, ill-painted, and representing a lad without youth or beauty, has called forth no emotion in the public mind.

But to return to art proper. M. de Neuville, M. Detaille, and M. Dupray have treated with much propriety subjects from the deplorable campaign of 1870. France there appears vanquished indeed, but vanquished not without nobility or beyond hope of recovery. A sculpture, by a pupil of the school of Rome, M. Mercié, touches this patriotic chord with supreme delicacy. He has sent a group bearing the title of *Gloria victis*. The battle has been fought, in the field or in the street, in the real world or in the ideal, and the young man has fallen, the victim of Force. Glory descends, takes the corpse on her shoulders, and, with curling lips, her head erect, her foot spurning the blood-stained ground, spreads her wings to bear above the reach of insults the martyr of an idea.

I cannot enter to-day into the detail of this Salon. But I pronounce it good and well worth visiting, and that in the name of a truth superior to circumstances, in the name of truth and liberty in art. A current is sweeping through our school: whence comes it? The question is a difficult one. It is urging us to take Nature for our

type—not on her coarser side, but in all that is comforting and exquisite, consoling and pure in her—in light, in the grand aspects of landscape, in respect for physiological laws and social types. This is an immense progress; it is to science that we owe it; and it is to liberty that we shall owe its signal consecration. "Light, more light," said the dying Goethe. It is the cry of dying men and of nations rising to new life. PH. BURTY.

THE MARINE GALLERY. FOR THE EXHIBITION OF PICTURES OF MARINE SUBJECTS BY DANISH ARTISTS, 142 NEW BOND STREET.

THAT the excellence of Danish artists in marine painting is more highly estimated abroad than at home would seem to be proved from the slight prominence that their class of works holds in the public collections of Copenhagen, and from the fact that such an otherwise judicious and complete handbook of native art as the *Nutids Kunst* of Julius Lange passes over without a word the labours of such men as Sørensen and Melby. This neglect at home is revenged by the unusual success of Danish sea-pieces abroad. If they are rejected, or "skyed" at Charlottenborg, they are accepted at the Royal Academy or the Salon. Hence the Danish marine painters begin to prefer a foreign to a native judgment of their work, and the illustrious exiles have grouped themselves here in London this year in such force, that they have dared to open a gallery entirely filled with sea-pieces by Danish artists.

With so much excellence, with so much patient fidelity to the truths of nature, with so much persevering observation, it is very disappointing that they do not succeed in being more interesting. The five painters who exhibit here—for Professor Simonsen's one work is so poor and so little characteristic of himself as to put his name outside the category—are all alike in their mode of treatment. Their draughtsmanship is excellent; the waves are drawn firmly and correctly; in most cases the painter has stood, apparently, on the shore, and drawn exactly whatever might be passing without any thought of composition or study of effect. The moments chosen are almost always the most commonplace conceivable—an early morning, cloudy, no colour in sky or sea; a sultry afternoon, with heavy mist, the entire tone yellowish grey; in no one instance has an attempt been made to break through the conventional timidity of design, to paint a heaven with the sun in it, or imitate any of the radiant and iridescent beauties of sunrise or sunset on the sea.

Professor Sørensen, whose name has a European reputation, contributes three small pictures, all interesting, but hardly characteristic of his genius. *Early Morning—Merchant Ships passing the Skagen Lighthouse* (2), is the most original in composition and arrangement of light. The water is too opaque; the vessels seem ploughing through an ocean of porphyry. There is a great want of transparency in the water in all the pictures. *Off Hastings* (21) is an exception to this. The spectator looks across the waves that curl and foam in the very act of breaking; they flash along the line of their summits, and throw down a luminous reflection below, and the hollows are very translucent and tender. This little piece is by Carl Bille, who contributes half the gallery, and exhibits it at its best and its worst. *Moonlight in the North Sea* (10) is his, and is one of the few pictures here that shows any feeling after what is poetic and imaginative. It is very fine in a quiet way. (20) is another good moonlight study of Bille's, but as a rule he is correct, and very uninteresting.

A subject from *Percival Keene* (24), by Baagøe, is almost the best rendering of motion to be found here, for these correctly-drawn waters are usually as dead as they are opaque. But in this case the frigate seems bearing down upon us, cutting the water into foam with its keel, and passing from the dark blue oceanic sea into the green and

pellucid water of the shallows. Two studies of the north-east coast of Zealand (27 and 28), by the same artist, are also meritorious.

EDMUND W. GOSSE.

DR. LEITNER'S COLLECTION.

THIS collection fills four large cases in the gallery of the Albert Hall, and contains a considerable number of early Indian sculptures, which form its only title to special notice. Among these sculptures a large proportion are of a somewhat unusual type, and have been made by Dr. Leitner the groundwork of a theory of Greek influence upon Indian art, which he has repeatedly urged upon the attention of the public. I have made a careful examination of the sculptures, and am strongly of opinion that the theory, even if true, derives no support from them. They are carved out of two sorts of stone—a dark-coloured slate or schist, and a whitish sandstone—and mainly consist of full-length figures in high relief (a few only can be called statues), of detached heads of various sizes, and of reliefs and architectural fragments which apparently have formed part of the external decorations of a religious edifice. I say *apparently*, for the catalogue which accompanies the collection vouchsafes us no information as to the circumstances under which they were obtained.

Those of his statues which are supposed to bear out his theory are classed by Dr. Leitner under two heads, as follows:—

"1. Graeco-Buddhistic, which show the influence of, presumably, Greek art on the representation of early and pure Buddhism.

"2. Indo-Bactrian (closely connected with the above), which show the relations of the Bactrian satraps with either Buddhist or other North-Indian princes."

And he adds that they

"were chiefly found at Takht-i-Bahai, in Yusufzai, on the frontier of Afghanistan by Dr. Leitner in 1870—in various parts of the Punjab northern districts (Taxila, Rawalpindi, &c.)—and in Swat by Dr. Leitner's Swati retainer."

No attempt is made to describe the excavations which, it is to be presumed, led to their discovery, or to distinguish between those found by Dr. Leitner himself and those "found by his Swati retainer," and of the source of which he has therefore only second-hand knowledge.

Dr. Leitner's is not the first collection of this particular variety of Indian sculptures that has reached Europe. In case No. 17 in the Ethnographical room at the British Museum will be found a number of small heads and figures of this type brought to London about sixteen years ago,* and the India Office Museum contains ten remarkably fine specimens of sculpture differing in no respect from Dr. Leitner's so-called Graeco-Buddhistic ones. They form part of a large collection made by Colonel Johnstone, of the Bengal Survey, and were presented by him to the India Office in 1871. In his official letter to Dr. Forbes Watson, Colonel Johnstone states that the sculptures were dug up by himself, in 1865, in the Murdan district, and mostly at the village of Takht i Bhai. He says: "Numbers of people have excavated on this hill (at Takht i Bhai). Lately the government made some special arrangements for further examinations. The remains are Buddhistic, as you know." It is evident then that Takht i Bhai has for years been a constantly explored mine of Indian antiquities, and we may reasonably suppose that Dr. Leitner has derived from it nine-tenths of his "Graeco-Buddhistic" sculptures.

At first sight the drapery of the standing figures in Dr. Leitner's collection has a decidedly Greek look about it, but a close inspection shows that there is no Greek dress with which it can be identified,† and it is in reality only a modi-

* I am informed that they are in terra-cotta, not stone, and were found "at or near Peshawur."

† It is nearer the *chiton* than anything else, but decidedly *not* the *chiton*.

fication of the well-known drapery of the statues of Buddha found in other districts, the robe being carried over both shoulders instead of leaving the right shoulder bare. This very collection contains Buddhas wearing this drapery, side by side with Buddhas, in every other respect similar, wearing the conventional robe. But the question is set at rest by the circumstance that a typically Hindu figure of a dying ascetic is clothed in this identical drapery.

I next come to a point upon which Dr. Leitner lays much stress—the supposed Greek character of the features in some of the heads. I readily admit that in many cases the features display a certain suavity of outline, which we are accustomed to associate with Greek statuary, and which may be looked upon as, to a certain extent, a departure from the conventional treatment of the human face usual in Indian statues. But here the resemblance ends. "For purposes of comparison" (he says) Dr. Leitner has placed on one of the shelves a genuine Greek head between two excellent specimens of the so-called Graeco-Buddhist art. This unfortunate collocation scatters to the winds the whole theory of Greek influence. A radical difference of treatment is discernible in every line and feature, though in the delineation of the eye it is especially striking. It is well known that Indian sculptors give to their statues what we call "almond eyes"—that is to say, the eyelid droops, and the opening of the eye is prolonged laterally to a degree often amounting to deformity. Now, in one of the two heads above-mentioned the opening of the eye is actually twice as long as that of the genuine Greek head, although the head itself is only about a third as large! This alone ought to be decisive, and the almond eye will be found in every one of the "Graeco-Buddhist" and "Indo-Bactrian" heads. Dr. Leitner's motive in placing on the same shelf the "corrupt Byzantine head" I cannot understand, as there is no article in the collection with which it is not in violent contrast.

The great majority of the figures have their hair dressed in the way usual in Buddhist statues, viz., raised into a knot at the top of the head and secured with a thread or narrow fillet. But there are three heads in the collection wearing head-dresses which Dr. Leitner claims as Greek. The first is thus described:—

"The North Indian Raja, with his thin moustache, the 'tikka' mark on his forehead is here, represented with a Greek diadem and head-dress. The face shows dignity and resolution, and is altogether the finest specimen of the kind in the collection."

I am aware of no "Greek diadem" that in any way resembles the head-dress of this fine piece of sculpture, and a near view reveals that it is merely the ordinary top-knot (mauli) of a Hindu king ornamented with jewels (chūdāmani) and secured with broad bands of some metal, probably gold.* This head is carved in dark schist, but there are two heads in white stone, in case 277, thus described in the catalogue: "First, an almost purely Grecian face and hairdress, then a female face surmounted by a diadem of a pleasing, though ironical expression" (*sic*).

What I have said about the two heads on another shelf is equally applicable to these, and it only remains to add that the so-called diadem appears to be the usual ornamental top-knot or crest, possibly bound with ribbon instead of metal, but in any case not to be identified with any form of Greek head-dress with which I am acquainted.

One of the most remarkable sculptures in the collection is the full-length figure of a king seated on a throne, and thus mentioned by Dr. Leitner:—

"We have never hitherto had this figure, either of Kanishka or of a Bactrian protector (though not worshipper) of Buddhism (reasons for which second

view will be alleged elsewhere), seated in this European way on a throne, instead of the cross-legged way of the Indians."

As a matter of fact, the legs *are* crossed, and the position is practically only a modification of the Indian mode of sitting. The figure is purely Hindu. The grotesque absurdity of the suggestion that it represents Kanishka will be obvious to any one who has seen the coins of that monarch.

Quite apart from any theory of Greek or other foreign influence, Dr. Leitner's sculptures are of high interest as specimens of ancient Indian art, and it is to be hoped that they will find a resting-place in one of our public collections. Their value would be singularly enhanced if they were accompanied by a detailed account of the excavations which led to their discovery.

I look upon Dr. Leitner's Takhti Bhai sculptures as examples of pure Hindu art, and as Buddhist, though exhibiting Buddhism in a late or degenerate form. I would place them at least as late as the fourth century of our era. That they differ slightly in character from sculptures found in other parts of Hindustan is undeniable; but I regard the difference as one of detail, and easily to be accounted for by the isolation of Takhti Bhai. In this remote subalpine nook, and under the peaceful rule of some line of petty rajahs, Hindu art may well have undergone modifications, some of which would be in the direction of improvement.

The rest of Dr. Leitner's collection need not detain us long. The modern Hindu and Thibetan images are of no interest, and the specimens of native industry, clothing, &c., though interesting in some points of view, do not require special notice here. Of the coins it is sufficient to say that they are such as may generally be purchased in the bazaars of Lahore, that with a few exceptions they are in indifferent condition, and that a large proportion are more or less clumsy native forgeries, a fact of which the catalogue makes no mention. With the possible exception of two or three Toorki MSS., Dr. Leitner's collection of manuscripts does not appear to embrace any work of importance. The Persian MS. to which he devotes half his catalogue is a pretty specimen of calligraphy, but scarcely merits Dr. Leitner's extravagant praise. Of the two Sanskrit MSS., one is a portion of *Nartananimaya*, and the other an astrological work copied at Multan in Samvat 1751. The *Goraksha Sataka*, of which Dr. Leitner gives a long notice, does not appear to be exhibited, but a copy of this work is in the India Office Library, and there is another in the Bodleian, a full and scholar-like account of which will be found at p. 236 of Aufrecht's Catalogue.

R. C. CHILDERS.

THE BRUNSWICK JEWELS.

THE sale that has been going on at Geneva during the last fortnight of the celebrated collection of jewels made by the late Duke of Brunswick, attracted a considerable number of amateurs and connoisseurs as well as merchants to that pleasant little city. It was known that several of the jewels had an interesting historical pedigree, and it was imagined that they possessed artistic as well as commercial value. This, however, proved to be a mistake, for, with the exception of a few fine pieces of Cellini enamel and some old silver repoussé work, there was not much that merited the attention of the true art student, whose admiration fortunately is independent of price.

The will of Charles of Brunswick, by which he left these jewels, and other property to the extent of three quarters of a million of money, to the city of Geneva, was the last sensational act of a more than ordinarily sensational life. To the last days of his life this royal reprobate managed to keep up the notoriety that he had gained by his vice and folly, and even after his death so contrived it that his name should still be on men's tongues.

The jewels now sold ran some risk of being lost

at the time of the Duke's flight from Brunswick. He managed, however, to save his personal property, and even to increase it, it is said, by some objects to which he had no rightful claim. During the whole of his after-life the Duke employed himself in adding to his collection, and some years ago published a detailed catalogue of it, in which the jewels were estimated as being worth half a million sterling. This valuation was probably not much exaggerated at the time, but their value has been greatly lessened since by the dishonesty of the Duke's own servants, and also by a depreciation in the value of the inferior yellow and brown brilliants (which formed the greater part of the collection) through the discovery of large deposits of stones of this kind at the Cape. The total sum realised by the Geneva sale amounted to no more than 45,000*l.*, but to this must be added nearly the same amount withdrawn in consequence of the limits fixed by the experts not being reached.

The only jewel of real historical interest was an engraved sapphire signet-ring, bearing the royal arms of England, which had once belonged to Mary Queen of Scots; but a curious statue in ruby of the goddess Vishnu was an object of great competition, and was finally sold for 600*l.*—ten times the sum at which it was put up. The commercial interest of the sale lay, however, wholly in the diamonds, many of which were of extraordinary size and rarity. Dealers from all quarters of the globe had assembled together to dispute for the possession of these little bits of crystallised carbon, and the confusion of tongues and costumes was something extraordinary. These privileged individuals were separated from the merely curious spectators by a barrier, and the calm way in which they dealt with thousands gave quite an awe-inspiring idea of the wealth of the trade they represented. The prize of the whole collection, an oval diamond of a slightly roseate tint, and of the great size of 41½ carats, was carried off by the well-known London firm of Messrs. Blogg & Martin.

MARY M. HEATON.

ART SALES.

AN assemblage of ancient and modern pictures, from different private collections, including a portion of the collection of the late Mr. W. Twopeny, was sold on Saturday last by Messrs. Christie, Manson, and Woods. The following are some of the principal pictures, with the prices obtained for them:—Frank Hals, *Portrait of the Artist*, 357*l.* G. E. Tiepolo, *A Scene from the life of Louis Antoine Jacques, Cardinal Infant of Spain, third son of Philip V.*, 157*l.* Sir J. Reynolds, *Portrait of Horace Walpole*, 42*l.*; *A Girl with a Bird*, the engraved picture, 189*l.*; *The Laughing Girl*, and the engraving, 168*l.* W. Hogarth, *Portrait of Mrs. Pritchard*, the actress, 52*l.*; *The Lady's Last Stake*, engraved by Cheeseman, 1,585*l.*; *The Gates of Calais*, 945*l.*; *Examination of the Recruits before the Justices Shallow and Silence*, 399*l.* G. Romney, *Portrait of Mrs. Shore Milnes*, 126*l.* T. Gainsborough, R.A., *Portrait of Richard Tickell*, 1,627*l.* Sir E. Landseer, R.A., *Blaise, the favourite Dog of the late Duke of Argyll*, 393*l.* R. Wilson, R.A., *Cicero's Villa*, engraved by Woollett, 294*l.*; *Lake Scene, with a Castle*, 550*l.* Van Huysum, *Flowers, Bird's-nest, &c.*, 525*l.* Canaletti, *A pair of views in Venice*, 504*l.* Murillo, *Our Lady and the Infant Saviour*, 283*l.*; *St. Thomas de Villanueva giving Alms*, 126*l.* Sir John Gilbert, A.R.A., *The King's Artillery at Marston Moor*, 372*l.*; *King Charles leaving Westminster Hall after Sentence of Death*, 798*l.* D. Maclise, R.A., 1854, *The Wrestling Scene in "As You Like It"*, 798*l.* C. R. Leslie, R.A., *Juliet*, 236*l.* W. C. T. Dobson, A.R.A., 1859, *Gretchen*, 220*l.* W. Collins, R.A., *The Spinning Girl of Sorrento*, painted in 1842, 157*l.* W. Etty, R.A., *Phaedria and Cymocles on the Idle Lake*, 535*l.* J. M. W. Turner, R.A., *The Falls of the Clyde*, 346*l.*; *On the Brent*, 650*l.* T. Webster, R.A.,

* See the fifth head to the right on the same shelf, which is in better preservation, and where the hair of the top-knot is distinctly represented.

Bird Catching, 252l. F. Leighton, R.A., *The Mermaid*, 290l. James Holland, *A View of Venice, circle*, 278l.; *Venice on the Grand Canal, with a View of the Exterior of the Artist's Studio*, 327l. John Linnell, sen., *Rest after the Mid-day Meal*, 1,008l. Wm. Linnell, *The Spring in the Woods and the Woods in Spring*, 215l. J. Constable, R.A., and J. Linnell, sen., *A Lake Scene with Sheep*, 420l. Peter Graham, 1871, *A Rainy Day*, 845l. O. Jansen, *Portrait of Queen Henrietta Maria in her Old Age*, 105l. Wouvermans, *A Grand Landscape with a Hawking Party and Stag-hounds*, 315l.

At Sotheby's, last Monday, the remaining portion of Professor Church's collection of old English pottery was sold. The specimens were numerous, and some of them of interest, as showing the development of the earthenware manufacture in England during the eighteenth century. But, as the whole of the best examples (525 in number) belonging to Professor Church were most unfortunately destroyed in the Alexandra Palace fire on the 9th of June last, the collection dispersed on Monday was of comparatively small importance. We believe it was considered by connoisseurs that the original collection, in its entirety, afforded the most complete illustrative series of English pottery in existence. It was particularly rich in specimens of three or four wares which had not before attracted sufficient attention. Among these may be mentioned, the fine hard red terra-cotta made by J. P. Elers, in Staffordshire, towards the close of the seventeenth century; the crouch ware, or white salt-glazed ware, which appears to have been produced from about 1680 to 1780; and the tortoiseshell, mottled, or marbled ware, which was manufactured in perfection towards the middle of the last century. Of the Elers' red ware named above, Wedgwood vainly tried to produce imitations, so fine and hard in body, and of so rich a colour was this early terra-cotta. The crouch ware was represented in Professor Church's original collection by over 200 specimens; three-fourths of these perished at Muswell Hill, among them being thirty examples enamelled (over the glaze) with colours of great richness. Fortunately, the finest specimen of this salt-glazed ware known escaped destruction, having been lent to the South Kensington Museum. It is a double-handled sauce-boat, covered with the sharpest decoration in relief, and having figures of the Seven Champions of Christendom set in panels. Over each figure is his name and that of the country of which he was the patron saint.

A well-modelled statue of Saturn, made at Fulham (about 1670), as well as a bust of Mrs. S. Pepys, of the same fabrique, were amongst the most valuable specimens of the early wares which Professor Church lost in the fire. Most of his Lambeth pieces were not sent; and these were sold on Monday. A puzzle-jug of the usual old Lambeth pattern was remarkable for being covered, not with opaque white, but with turquoise blue enamel. Amongst the old Staffordshire wares sold was a large dish representing the Temptation, the figures of Adam, Eve, and the Serpent being childishly grotesque in drawing, but the whole piece showing in its colouring a kind of reflection of Italian majolica. The date of this specimen was probably early in the seventeenth century.

THE sale at the Hôtel Drouot of M. H.—'s objects of art has been one of the most remarkable of the year. A fine Boulle clock, tortoiseshell and copper, with dome top, surmounted by a figure of Minerva, sold for 24,640 fr. Another, also of the Louis XIV. period, surmounted by a figure of Time, with a group of figures representing the Fates below, and with this legend, "Cumteta cum tempore regunt," maker, Gaudron, Paris, 12,100 fr. A "garniture" of three oriental vases, 8,000 fr. A silver soup tureen, chased and repoussé with the armorial insignia of the House of Orleans, encircled by the grand cordon of the Order of the Saint Esprit, period Louis XV., 6,000 fr. A ewer

of Limoges enamel, by Léonard Limousin, 3,700 fr. A bronze equestrian statue of Louis XIV. in the costume of a Roman emperor, 5,300 fr. Another clock, period Louis XVI., bronze chased and gilt, with two winged genii, style of Boucher, seated in the clouds, the movement marking the day of the month and of the week, by Robert aîné, 6,000 fr. Two dogs, time of the Regency, chased and gilt, 4,000 fr. A magnificent chiming clock, time of Louis XIV., overlaid with tortoiseshell and marquetry, and decorated with a figure of Fame blowing her trumpet, the maker "Gribelin, à Paris," 9,305 fr. Seven tapestries, hunting subjects, sold for 5,250 fr. The sale realised 305,445 fr.

A PORTRAIT of Mrs. Carr, by Gainsborough, about 9 in. by 6 in., exquisitely painted, and in a perfect state, was sold on Monday last by Messrs. Christie, Manson, & Woods, and bought by Mr. Agnew, for 400l. 10s. At the same time a portrait of Adrian van der Velde, painted by himself, from the Northwick Gallery, sold for 74l. 11s., and a portrait of himself, holding a miniature, by Murillo, sold for 10 guineas only.

AN important sale of modern pictures took place a week or two since at the Hôtel Drouot. The following prices were realised:—*Le Grecs combattant pour leur Indépendance*, Eugène Delacroix, 25,000 fr.; *la Fiancée d'Abydos*, ditto, 10,000 fr.; *la Canzonetta Italienne*, Carolus Duran, 5,000 fr.; *une Bergerie*, Jacque, 6,400 fr.; *Vue de Venise*, Ziem, 6,200 fr.; *la Tricotouse*, Jules Breton, 10,500 fr.; *la Baigneuse*, Couture, 4,600 fr.; *Réverie au bord de la Mer*, Courbet, 4,600 fr.; *Solitude*, Jules Dupré, 9,500 fr.; *Rendez-vous de Chefs Arabes*, Fromentin, 17,100 fr.; *la Sieste*, ditto, 10,300 fr.; *Bergère lutinée par l'Amour*, Millet, 5,000 fr.; *Taureau*, Troyon, 11,500 fr.; *Broderie*, Willems, 7,900 fr.; *Vue du Bosphore*, Ziem, 4,550 fr.; *le Chasseur à la Bécasse*, Decamps, 3,250 fr.; *Enfants Turcs jouant avec un Léopard*, Diaz, 4,100 fr.; *Suzanne surprise par les deux Vieillards*, ditto, 4,550 fr.; *une Taverne au seizième siècle*, Léon Escosura, 3,400 fr., etc.

NOTES AND NEWS.

It is stated that a distinguished party of German scientific men, who have been making archaeological researches in Greece, and at Smyrna and other parts of the coast of Asia Minor, arrived in Constantinople on Saturday week from the Dardanelles, where they had been visiting Mount Ida and the plains of Troy. The party consists of Professors Hartel, of Vienna, and Otto Keller, of Friburg, Count Lanskoroinsky, and Barons Arthur and Theodore von Dunreicher.

At the Brazenose Club, Manchester, an exhibition of a loan collection of mezzotint proofs, after Sir Joshua Reynolds, has just been opened; and Mr. Alfred Aspland and Mr. J. Lees Aspland have compiled a catalogue of the same, which gives to those who are not specialists in the matter of Sir Joshua's portraits much information of interest. The collection is derived from about six private collections, of which several are owned by members of the Brazenose Club.

MR. PROCTOR, of Bristol, having given his house to that city, for use as a Mansion House, Mr. Robert Lang has followed a generous example by giving, for decorative purposes, to the citizens a very precious collection of old English china, including many specimens of the Bristol fabric.

THE annual exhibition of paintings at the Fine Arts Academy in Clifton is now open. The principal work, which of course has a local interest, is Wallis's *Death of Chatterton*, but this is not enough to draw a crowd, especially in a place which is certainly not to be accused of too absorbing a devotion for art.

M. GABRIEL-CHARLES GLEYRE died suddenly, on the 5th instant, while visiting the Retrospective Exhibition in Paris, at the age of sixty-eight. He

contributed a painting of *St. John under the Inspiration of the Apocalyptic Vision* to the Salon of 1840; *Evening*, in 1843; *The Apostles going forth to Preach the Gospel*, 1846; and the *Dance of the Bacchantes*, in 1849. These four pictures gained him the title of the "painter-poet." Since 1849 he has exhibited nothing, but he has continued to work privately, and was engaged on a picture of Adam and Eve in Paradise on the morning of his death. He has given lessons in his art for the last twenty-five years, and M. Taine states that a third of the eminent living painters of France may be reckoned among his pupils.

THE death of the sculptor Gustav Bläser, at Cannstadt, on April 24, leaves a void in German plastic art that will not be easily filled. With him has departed one of the last survivors of the period of Rauch, Schinkel, and Schadow; and at Berlin, where so many of his works attest the success with which he cultivated the special forms of art, of which they were the masters in Germany, the regret for his loss will be commensurate with the high esteem in which he has long been held. Gustav Bläser's last work, a colossal equestrian statue of Frederick William III. of Prussia, was unfortunately left incomplete at his death; but the original design has now been carried out by the master's pupils, and it is hoped that the casting will be successfully accomplished in the course of the summer, when the group will be erected at Cologne in accordance with the original plan.

THE death is announced of Mr. John Lucas, the well-known portrait painter, at the age of sixty-seven. He commenced life as a mezzotint engraver, but afterwards devoted himself entirely to portrait painting. Among his best-known works are portraits of the late Duke of Wellington, Mr. Gladstone, Lord Palmerston, Sir James Graham, and George Stephenson. The *Times* states that upwards of sixty of his works have been engraved.

THE Exhibition of the works of Prud'hon opened on Monday last, and will remain open till July 4.

THERE is much talk going on in Rome just now concerning the sudden disappearance of a painting by Raphael from the Sciarra Gallery. The painting in question is the well-known *Violin-player*, and it is said to have been sold by its possessor to a foreigner who will take it out of Italy. This is contrary to the Pontifical laws of 1802 and 1820, which prohibit the removal from Italy of any celebrated works of art, as well from private as from public collections. The point to be decided is whether Pontifical laws are still in force in Rome.

AN engraving, by W. H. Simmons, from Tissot's picture, called *News of our Marriage*, has been published by MM. Pilgeram & Lefèvre. Half a year ago these publishers issued a very good engraving, by Ballin, of the same painter's picture of lovers parting, called *Les Adieux*. Here we have a companion print of an exceedingly happy kind. The newly-married pair are on their honeymoon tour, and seated on a window-bench of an old-fashioned sort, for the costume is that of a century ago: they have found in a newspaper the notification of their wedding, the reading of which is the subject of the picture. Behind the figures the bayed window gives us a charming background of a seaport and shipping, such as the Thames at the Pool presents. The bashful amusement expressed on the girl's face, a thoroughly English one of the ordinary type, is a capital bit of character, and exceedingly amusing; indeed, the two faces close together, with the newspaper spread out in front of the young man, is very cleverly managed. Mr. Simmons's part of the work is very adequately carried out in mezzotint. The only point we can remark as unsatisfactory is the undeveloped figure of the bride, the upper part of her costume being poor in drapery and expressing no body within. But this technical

defect will not prevent this *pendant* to *Les Adieux* being even more popular than its predecessor.

THE magistrates of Nürnberg have granted the permission demanded of them by Herr Soldau to use the large town-hall of that city for the public exhibition of Kaulbach's collected works. A committee, composed of artists and patrons of art, has been formed at Nürnberg to carry out this design, and we may therefore soon have an opportunity of seeing Kaulbach's works—which are to be hung in a systematic order according to the time of their composition—covering the same walls which in bygone ages displayed to the eyes of his admiring countrymen the marvellous paintings of Albrecht Dürer. A letter of condolence has been addressed to the widow of the great artist by the magistracy of Munich, and a committee is at present being formed to take into consideration the most fitting manner in which to erect a monument or other memorial in his honour. It is intended that this tribute of respect to the memory of Wilhelm von Kaulbach shall be carried out in a way at once worthy of his reputation and of the position of the Bavarian capital as one of the greatest art centres in Germany.

AN excellent etching, by Le Rat, of Moroni's well-known *Portrait of a Tailor*, in the National Gallery, forms the frontispiece of the *Portfolio* this month. Besides this, we have a full-page etching of a picturesque old house, by Ernest George; and two small ones in illustration of the sylvan year. Mr. Basil Champneys continues his pleasant discourse upon Rye, pointing it by several pretty little sketches; and Mr. G. A. Simcox tells us, *à propos* of the show of bound books at the International Exhibition, that "Book-binding is an art whose difficulties are increasing, and whose opportunities are, upon the whole, diminishing."

THE recent decrees affecting the Fine-Art Schools in Italy, have raised storms of no mild character among the academicians of Florence, Milan, San Luca, Venice, and Rome. It is the old story—the jealous guarding of privileges and advantages by the old against the encroachments of the young. The elder academicians resent the development of free art instruction, and the interference of Government in art questions—in fact, they resent everything that is not in accordance with their particular prejudices and crotchets. The official party, however, who have established free art schools under ministerial presidency and surveillance, are regardless of the displeasure of the academicians, and hold their own with firmness. Reports have been drawn up, statutes framed, and petitions signed, by indignant artists and enthusiasts; it has been argued, and justly so far, that in the present condition of affairs, the fine arts of Italy are under the direction of men who are not familiar with art—who may perhaps be authorities on Blue-books—but who could not discuss the merits of Gainsborough's *Blue Boy*. The Minister of Public Instruction, however, remains unmoved amidst all these protestations and arguments.

In the *Nuova Antologia* for April, the present difficulties among Italian artists are exhaustively set forth by Camillo Boito, who is of opinion that art is of no school, and will not be subjected to the prejudices of academicians any more than to the decrees of Government officials. The great masters of Italy were certainly not the academicians.

A LECTURE was given last week in the Colosseum at Rome, by Professor Fabio Gori, of Turin, in which he attempted to show that there were positively no historical grounds whatever for the long-cherished idea that the arena had ever been the appointed place for the martyrdom of the early Christians. In his opinion, there was not a shadow of authority for this assumption, although the Circus Maximus and other large areas, appropriated to public games and civic commemorations of various kinds, were no doubt occasionally

made the scenes of such forms of martyrdom. At the conclusion of his lecture, which was listened to with marked attention, and occasionally interrupted by enthusiastic applause, Professor Gori appealed to his audience to refute his statements if they considered them unfounded; but no one accepted the challenge, although, among the six hundred persons who listened to this novel and interesting *à fresco* lecture, there were many of the most distinguished of the *literati* of Rome.

THE attendance at the Munich Academy of Arts has become so large, that it has been found necessary to hire private studios and other working rooms for the students, since the present buildings have long ceased to be sufficient for the requirements of the establishment. Under these circumstances, it is a matter for general satisfaction to learn that the Bavarian Ministry has announced its intention to lay before the Chambers a proposition for a grant of 500,000 florins, to defray the expenses of erecting a building worthy of the spot and of its object.

IN the *Gazette des Beaux-Arts* for May we find: 1. Three chapters of Charles Blanc's "*Grammaire des Arts Décoratifs*," relating to the art of the jeweller and goldsmith. Illustrations of various kinds of ornaments are given, and the different modes of diamond-cutting described. 2. M. George Duplessis writes an account of Edouard Detaille's artistic career, and of his *modus operandi*; an account that is made more valuable by a number of spirited sketches, taken from M. Detaille's album, of horses and their riders. Detaille is the cleverest pupil of Meissonnier. He made a name in 1869 by his *Repos pendant la Manœuvre*. 3. A short note on the Chapel of the Palazzo Ricardi, in which are preserved some of Benozzo Gozzoli's frescoes, executed before the famous series of the Campo Santo. 4. A continuation of Paul Mantz's critique on the Suermondt gallery, with an etching by Léopold Flameng of Rembrandt's *Repose in Egypt*, and another, by T. Chauvels, of Wilson's *Conway Castle*. 5. "The Romanesque Architecture of the South of France" is continued by Alfred Darcel. 6. The study of Daubigny, begun in the last number by Frédéric Henriot as the first of a series on contemporary landscapists, is extended to his engraved works, of which we have a complete catalogue. Several of the etchings are marked as being "*à la cravate*." This is a process invented by Daubigny himself to replace aquatints. 7. The bath-chamber of Cardinal Bibbiena, the decorations of which are by Raphael, is described by P. Senneville. 8. The metope in white marble, found by Schliemann in the uppermost of the cities which he excavated, is commented on and described by M. O. Rayet, who has himself been lately occupied with similar archaeological excavations. The metope represents the chariot of the Sun, as described by Homer, and is considered by M. Rayet to belong to the time of Lysimachus, though some archaeologists see in it a work of the Roman period. 9. Paul Sédille writes a memoir of Victor Baltard, which is accompanied by a portrait sketch of the late well-known architect by Ingres.

THE STAGE.

SOME ACTING AT THE VAUDEVILLE.

MR. ALBERY'S new comedy, at the Vaudeville Theatre, being, as the *Times* has very truly and even elaborately indicated, a play of character rather than of incident, affords an unusual amount of opportunity for acting of a high kind; and as the opportunity is not only afforded but taken, the ACADEMY would do well to treat the performance as it treated that of Mr. Gilbert's last important piece at the Haymarket: returning to it, that is to say, to speak of the acting with a little more of detail than was desirable, or even possible, a fortnight ago. And yet as one sees the piece with the hope of finding something new to say about it—of breaking up fresh ground in a

field over which an accomplished fellow-labourer has already passed—there is perhaps little that strikes one as very specially salient: there is no moment of supreme interest; no display of exceptional brilliancy; nor does any one good actor, out of the many good ones, hold himself in reserve for a particular outburst, either of pathos, passion, or comic force. This is a performance in which "the individual withers," and the *whole*, if not the world, is "more and more." The performance of the piece is noteworthy for its completeness. Not one part in *Prude* is badly played.

But though no part is badly played, there are times when more parts than one seem to suffer through a certain absence of naturalness, due to the author himself. Mr. Albergy's piece shows on the whole, on his part, as genuine a knowledge of human nature as of literary art; but there is here and there a moment when he is not true at all—a lapse of instinctive power; a droop, so to say, in his faculty—and here the actors play either badly or indifferently that which they should not be called upon to play at all. And paradoxical as it may seem, I think it is to their credit in some sense that they do so. It is to their credit, because it says much for their own appreciation of what for a given moment is or is not a fitting word or deed. They have entered into the characters the author has drawn; they find it quite within their means to give appropriate expression to the appropriate phrase or the appropriate action, and that is all one has a right to ask one's interpreters to do. But perhaps, without knowing it themselves, they do fail to give anything like equal force to the words and situations which are there, if one may say so, by mistake. Two instances of this occur to me—I think there are no others in the piece. It is wholly unnatural for Sir Ball Brace, when he has been severe in his remarks on his brother-in-law, to express his penitence at the feet of Gertrude as if he were a penitent child. And Mr. David James, obediently fetching the hassock, and making, so to say, his general confession and promise of amendment, while Miss Amy Fawsitt (I apologise—Miss "Gertrude Cadbutton") absolves and pardons him as best she may, cannot make us believe in the reality of this situation. Poor old sinning Sir Ball, a gambler who has lost everything but the kindness in his heart—he has something of Rawdon Crawley in him—he is in his second childhood, it may be said: but then his ingenious little niece is almost in her first, and it is not first childhood that sees second childhood the soonest. It sees Old Age, and does not ask Old Age to fetch a hassock, and pour out the tale of its faults. The second instance is less grave, and it arises from that strong temptation which seems often upon Mr. Albergy, but which he often overcomes: the temptation to make a character say at a given moment, not just the likeliest thing, but just the sharpest thing. In the last act, the village school-mistress and her husband are in sore trouble, and it vexes the wife to see her husband trying to seem cheerful at a time when cheerfulness at the best is but assumed, and she tells her good friend Gertrude, the merchant Cadbutton's daughter, that his attempt is a pain to her, to which Gertrude makes sharp answer: "Well, let's hope he'll be more miserable to-morrow." That is a sentence to which Miss Fawsitt cannot give its force, simply because she cannot cause it to be natural. It does not express Gertrude's mind, but Mr. Albergy's hankering for repartee. If it expressed her mind—if the retort were a fitting one—Miss Fawsitt would deliver it, not tamely as at present, but with her wonted fu'ness of meaning. For it is in the peculiar point of her delivery that much of Miss Fawsitt's merit as an actress may be said to consist—not all of it, of course: that would be a ridiculous thing to say in speaking of an actress who is so much a mistress of the variety of gesture and of facial expression which Comedy requires: but much of it nevertheless, and here let us notice how absolutely she contrasts with a comrade at the Vaudeville—Mr. Thomas Thorne—and con-

trasts of course not as good with bad, but as one good with another good: since while it is a part of Miss Fawcitt's art to deliver her sharp things as if she relished them intensely and took supreme delight in saying them, it is a part of Mr. Thorne's art to deliver his sharp things not unconsciously indeed, which is the way of all humourists whose delivery is considered "dry," but, rather, modestly and diffidently, with dropped eyes and humbly folded hands, as one who having laboured over a good thing does just venture to utter it, but withal apologetically, with an abiding sense that it ought to have been something much better. Mr. Thorne's part—of a mechanic who invents ingenious and difficult processes for doing things well enough done without them—is an important one, and it is in adequate hands. Nor is Miss Bishop's part, of the schoolmistress, small: nor is it played inefficiently.

Mr. David James seconds Mr. Albery well in making of Sir Ball Brace an individual character. Here and there the part could be played with greater *finesse*; but Mr. James gives to it great reality: nay, he does more; he makes us like Sir Ball Brace very much—he is such an affectionate fellow: he is so sorry that he sold his sister to be the scheming Cadbutton's wife: he doats so upon his niece: he would be so generous with his money if he happened to have any: he believes so fully that he is his himself a gentleman, that we forget he takes his brother-in-law's sovereigns from a convenient drawer, and is in the power of the "marker" of the Grey Stag. This marker is played excellently by Mr. Horace Wigan. He is a man of few words but many looks. His eloquence is in his reticence; and that is the kind of thing which Mr. Horace Wigan does so exceedingly well. As he moves about, observing, with a knowing look in his eye, and again a smile on his mouth, you feel he is a power, and that it would be indiscreet to make him your enemy. So Mr. Horace Wigan is well fitted in his part, small as it is; and so indeed is Miss Larkin, who has not been seen to such advantage since she acted in Jerrold's *Time Works Wonders*, and placidly accepted her position of dependence—"people who live in other people's houses" have felt the steep stairs and the bitter bread from Dante's days till now; and as Miss Kate Terry in *Henry Dunbar* showed us with rapid gestures of impatience all the irritation of this dependence, so Miss Larkin has seemingly set herself to show how comfortable dependence may be when it is accepted with a philosophic mind. The decayed gentlewoman in *Pride* mounts guard when her employer's daughter and his secretary show a tendency to flirt. When Mr. Cadbutton puts up for the borough, she is the first to secure a wavering ratepayer. At the right time she is just as willing to be pleasant to the secretary as she is to be rude to him. She enters with enthusiasm upon the political struggle, and hears at last with becoming surprise and delicacy, and with an air of propriety which is not to be surpassed, that Mr. Cadbutton's "intentions" with regard to her are such as will very fully reward her devotion.

The secretary, who is in due time rewarded with the hand of this ingenious, tender, yet pleasantly malicious romp whom Miss Fawcitt represents with full understanding of the character—as I, differing from some others, must nevertheless venture to conceive it—is played by Mr. Charles Warner, always carefully, and now and again with something much more than care. His love-making is gentle, yet impulsive; his indignation when he is accused is strongly restrained, and yet is stronger than the restraint which is put upon it; and his delivery of commonplace talk is almost more natural than the best stage-naturalness; so that the illusion is greatly aided. But the part he plays, unlike almost every other part in the piece, is one in which incident predominates over character. The secretary is a worthy fellow, indeed, but Mr. Warner, though he can make him real, cannot very well make him original. I speak last,

and it must be very briefly, of Cadbutton and his performance by Mr. William Farren, who now leaves behind the high-bred gentleman of last century comedy to represent with no less force and conscientiousness—though, as it seems to me, with a little less of finish—a persevering snob who is newly rich and newly proud. The character has received the most careful treatment from Mr. Albery, who has made it no rough study, but a finished picture. The stage has seen a hundred *nouveaux riches* who were pretty good-hearted men, but not many *nouveaux riches* who, along with their bad manners, are as corrupt as any stage-peer, and when it has seen these, it has generally seen them punished at the end. But Cadbutton, as Mr. Albery's writing makes him, and as Mr. Farren's changing voice and forcible facial expression show him, has done a worse fault than the horrible social one of earning a great deal of money in a very little time, and yet he is not *all* fault: there is "the soul of goodness in him"—love for his child—or the soul of greatness—perseverance. And so, in absolute and delightful defiance of the dull and common demand made in such cases, that a writer shall deal out "poetical justice" instead of nature and truth—in absolute and delightful defiance of the feeling that this man must be punished by the very world he has wronged—Mr. Albery drops the curtain as the energetic and thick-skinned adventurer has laid the ghosts of his former misdeeds, and as bands are playing and free electors cheering that Cadman Cadbutton, who, if steady self-seeking may be allowed its reward, will ere nightfall be returned to represent his borough.

FREDERICK WEDMORE.

THE St. James's Theatre opened on Saturday night with a programme of some importance, but with results not quite so satisfactory as well-wishers of the theatre had expected. Mr. Robertson's *Progress* is an ambitious piece—ambitious at least of the sort of success which falls to the lot of *Caste*, and *Play*, and *Ours*—but it is not altogether a delightful one, and is founded, moreover, on the work of a man who himself is often but a borrower—we mean M. Victorien Sardou. It was *Les Ganaches* that suggested *Progress*, and both are devoted to the glorification of mechanical and material advance. At the St. James's, Mrs. Buckingham White and Miss Rose Coghlan played their parts very creditably indeed. Of the other performers, some were efficient, others scarcely equal to their task. The play was followed by Offenbach's *Vert-Vert*, the music of which, as all the world knows, has its own charm, "puisque c'est d'Offenbach." The interpretation was unequal. The stage was occupied a good deal by young persons who have not yet succeeded in acquiring the fame which no doubt they deserve. The audience was not enthusiastic.

At the Royalty Theatre they have revived the *Little Treasure*, with which most playgoers, save the most recent of all, are familiar as an elegant little piece, demanding more delicate acting than it always receives. No great fault is to be found with it, however, as it is presented at the Royalty.

MR. BARRY SULLIVAN has just finished one of those long provincial tours by which, from time time to time, he—like so many of his brethren nowadays—wins applause and money, which are scarcely to be matched in London.

MR. FLOCKTON's selected company, organised for the performance of Mr. Albery's comedies, was playing in Bristol last week, with success. The pieces given were *Apple Blossoms* and *Two Roses*, in which the heroine's part is said to be acted quite gracefully by Miss Susan Rignold, who was for a short while at the Vaudeville.

La Pêricle, written by Meilhac and Halévy, with music of Offenbach's, has been revived at the Théâtre des Variétés.

Heart's Delight, Mr. Halliday's excellent version of one of a great man's greatest novels, is now played, at the Surrey Theatre, by Mr. Emery, Mr. Montague, Miss Helen Barry, and others.

AN aggrieved correspondent writes to us upon the subject of refreshment at the theatres. The theme he says is a humble one, and yet one worthy to be discussed. We quite agree with him that the matter wants amending—that is, that it is rather a hardship that there are scarcely three theatres in London where you can have a cup of tea for sixpence and the asking for it. It is the habit of our correspondent, like the rest of the world, to take a cup of tea at nine or ten o'clock, and he wants to know on what conceivable theory his manner of life is to be so far upset that he has no alternative but to substitute seltzer and sherry for the beverage which is accustomed to restore him. Our correspondent has undoubtedly a grievance, and though we do not print his letter, it would have been very hard upon him not to give facilities for the expression of the substance of his complaint. It is not always in the power of the managers to give us good art, but they might give us good tea and tolerable ventilation. These would materially reduce the sufferings of habitual playgoers.

MUSIC.

Felix Mendelssohn Bartholdy; Briefe und Erinnerungen. Von Ferdinand Hiller. (Cöln: Du Mont Schauberg.)

THERE is not one, probably, of all the great composers of whose personality it is possible to form so distinct and accurate an idea as of that of Mendelssohn. This is not to be accounted for merely by the fact of his having lived so near to our own time as to be almost like one of ourselves; he seems to have exerted a kind of spell over all those with whom he was brought into immediate contact, which has impressed upon the memories of his personal friends so many of his sayings and doings that the various collections of "Mendelssohniana" which have from time to time appeared, are even fuller of detail and anecdote than is usually the case with such publications. The "Recollections" of Edward Devrient and of Madame Polko both abound in those little touches which combine to make a complete portrait, another side of which is presented in the recently published book on *Goethe and Mendelssohn*. But even more than from the reminiscences of his friends, is a clear idea of Mendelssohn's genial and highly cultured individuality to be obtained from his own letters. Though above and before all an artist, he was also a thoroughly educated and accomplished man; and his correspondence, sparkling as it is with genuine humour, reveals at once the amiability of his disposition and the acuteness of his intellect. Reading his letters, especially those written to his family and his intimate friends, is almost like talking with the writer; there is an easy conversational style about them, and at the same time a polish (evidently unstudied) of diction, which cause them to rank among the most charming specimens existing of the "letters of eminent persons."

By no means the least interesting and valuable of the various books on Mendelssohn which have as yet appeared, is the present work, from the pen of one of his oldest and most intimate personal friends. In his preface Dr. Hiller, using a very happy illus-

tration, says that just as a number of photographs of the same person in different positions will each present his image with a likeness recognisable but not exhaustive, till a great painter comes who combines in one picture the various characteristics of these portraits, and gives us what we feel to be a reproduction in common of the entire man, so the reminiscences of a distinguished character from different hands give a correct, yet to some extent one-sided representation of him, till a competent biographer shall, by the collection and combination of the various materials, bring the whole individuality of his subject into view. The object which Dr. Hiller proposes, in what he calls "a photograph of Mendelssohn as he is mirrored in my memory," is to show him in his relation to a brother artist. He adds:

"Music cannot be described; language is altogether inadequate to reproduce even approximately the musical contents of a tone-poem. Just so, not many details can be recorded of what actually took place in the close intimacy of two artists. The hours which I passed with Mendelssohn at the piano, the interchange of our musical views respecting compositions of many kinds, our own and other people's, were in a certain sense the best that I was privileged to spend with him—but to give more than the most general account of them would be impossible."

Notwithstanding the difficulty of which our author complains, he has certainly given a surprisingly large number of recollections, many of which, so far from being vague, are singularly vivid, and help the reader to realise the character of Mendelssohn with great distinctness. This very abundance of detail renders it the more difficult to give an adequate idea of the book in the columns of a review. Fortunately, however, for all lovers of music, the work is not inaccessible even to those unacquainted with the German language; as a translation of the whole is at present appearing in the pages of *Macmillan's Magazine*. All that is possible here is to give a general outline of its contents, with a few extracts by way of illustration.

The book is divided into eight sections, the first of which is entitled "In Frankfurt am Main," and records Hiller's first meetings with Mendelssohn in 1822, when the latter was a boy of thirteen. Hiller tells how his master, Aloys Schmitt, brought young Felix on a visit, and the first thing he saw was the boy jumping up on the old gentleman's back, in the courtyard in front of the house. The whole description of the following interviews, and of Mendelssohn's playing, are most interesting, especially the account given (pp. 4, 5) of his extempore performance two years later, in private, on Handel's theme, "See the conquering hero comes," with reference to which Hiller remarks, "Often and splendidly as I have heard Mendelssohn play in later years, I have seldom had a more bewildering impression from his playing than that which he then, a boy of sixteen, made upon me."

The second division of Dr. Hiller's book brings the reader to Paris, December 1831 to April 1832. As in a panorama, all the principal musical celebrities of the time pass before his eyes. He is introduced, among others, to Habeneck, Cherubini, Meyerbeer, Chopin, Liszt, and Kalkbrenner; and many are the interesting details and anecdotes re-

corded concerning them. Take the following, for instance, of Cherubini:—

"Mendelssohn from time to time visited the worthy old Cherubini. 'He is such an extraordinary master,' Felix said once to me. 'Now you would think that before all a composer should possess warmth of feeling, heart, soul, or whatever you may call it—but I believe Cherubini does all merely with the head.' After Mendelssohn had one day shown him an eight-part composition, a *capella* (I think his *Tu es Petrus*), he told me how things had gone, and said in conclusion, 'But the old man is too pedantic; I have a doubled suspension of the fourth, and he would not allow it under any circumstances.' In later years we referred to the same point, and Mendelssohn said, 'And the old man was right, after all—one should not write it.'"

In the third division of his book, "In Aachen and Düsseldorf," Hiller gives us the first of the valuable series of letters which form so important a feature of the work. Of these there are in all nearly thirty, most of which are now published for the first time. No mere extracts will do justice to the playful humour, the sterling common sense, and the genuine kindness of heart which they evince. In one of the earlier letters from Düsseldorf, Mendelssohn gives an amusing account of the orchestra which he had to conduct:—

"I assure you, when I give a down beat, all begin singly, but no one exactly right, and in the *pianos* we hear how the flute is too sharp, and there's not a Düsseldorf who can play triplets clearly, but he always makes one quaver and two semiquavers, and every *allegro* leaves off twice as fast as it begins, and the oboe plays E natural in C minor, and all the stringed instruments are carried under the coats in the rain and uncovered in the sunshine—if you heard me conduct this orchestra once, four horses would not bring you back for the second time. With all this there are a couple of musicians who would do honour to any orchestra, yes, even to your conservatoire; but that is just the misery in Germany, that the bass trombone and the drummer and the double-bass are excellent, and all the rest most execrable."

In justice to the Düsseldorf orchestra, Hiller tells us that when twelve years later he undertook the post of conductor in that town, he found the music there on quite a different footing.

In introducing the fourth portion of his book ("In Frankfurt am Main; the summer of 1836"), Hiller records his impressions of the Lower-Rhenish Musical Festival at Düsseldorf, at which *St. Paul* was performed for the first time. He says:—

"Having arrived too late to be present at the rehearsal, I found myself in the presence of a new work, somewhat lonely in my place, longing for fresh air in a fearful heat, and under these circumstances did not receive the deep impression which I had expected. (Later, the oratorio became continually dearer to me, and I consider it, especially the first part, one of the noblest, finest compositions of Mendelssohn.) But the audience, who heard the work for the third or fourth time, were enraptured, the performers inspired; and when on the third day, among other pieces, the chorus 'Rise up, arise!' was encored, I heard with quite different ears, and shared in the enthusiasm of others."

It was in the year 1836 that Mendelssohn first made the acquaintance of his future wife, then Mdlle. Cécile Jeanrenaud, the daughter of a pastor of the French Reformed church. Dr. Hiller gives many recollections of this time; and the allusions to his intended

in Mendelssohn's own correspondence are numerous. One of the most amusing letters in the volume is the grumbling one written from Holland, where he had gone to take some baths, in which he wishes himself back at Frankfurt, and jocosely threatens Hiller that if he does not send him back a letter of at least eight pages, he may possibly turn cheesemonger, and never return to Germany. "Not a sensible idea," he says, "has passed through my head since I left the Hôtel de Russie; now I have already become quite used to this, and do not expect anything sensible. I only reckon how long it is before I return, and rejoice that to-day I take my sixth bath—about a quarter of the whole penance. Had it been you, you would have packed up ten times already, turned your back on Cheese-land, said some very unintelligible words to your travelling companions, and gone home; I should like to do it too, only a certain Philistinism which I am known to possess, keeps me back."

It is not merely, however, the quiet humour of these letters that makes them so enjoyable; they also contain a large fund of good sense and acute observation on musical topics. Especially interesting in this respect are the criticisms, always kind but not less candid, of Hiller's own compositions. There is one in particular (pp. 73–76) on this point, referring to the coldness of the reception of Hiller's concert-overture in D minor at Leipzig, which Mendelssohn attributes to want of sufficient thought and care in the development of the subjects, which is worthy the attention of all musicians. Mendelssohn declares that while the power of inventing good themes is a natural gift, the art of treating them to the best advantage is one which anyone may acquire who studies sufficiently. In some remarks which Dr. Hiller has appended to the letter, he combats his friend's views on this subject, and points to the wonderful effects which the great masters have produced from, at times, the most unpretending material. It is the old story of the gold and silver shield; both are in the right; but they look at the matter from different points of view.

Mendelssohn was married on March 28, 1837; and Dr. Hiller mentions the interesting fact that his well-known *Forty-second Psalm* ("As the hart pants") was composed during the wedding-tour. In September of the same year, we catch a glimpse of him in London from a grumbling letter (p. 88) in which he complains of having to be away from his wife, and go to Birmingham to play the organ, and adds, "I must be a little bit fond of my wife, after all; for this time England, and fog, and beef, and beer, taste infamously bitter—and I used to like them all!" A passing remark in the following letter, written from Leipzig after his return, gives an intimation of the overtaking of his powers, which undoubtedly shortened his life. He says, "So much conducting during two such months takes more out of me than two years when I compose all day long; I can hardly get to it, in the winter. And when, after the greatest worry, I ask myself what is the actual result, it is at last scarcely worth speaking of; at least, it does not interest me much whether all the well-known good things are given once more, or better,

or not. The only things that interest me now are the novelties; and of them there is an entire failure. I often feel quite inclined to retire, to conduct no more, only to write; and yet, again, such an organised music life and its direction have a certain charm." In the same letter Mendelssohn writes of the great effect his music had produced at Birmingham, and of Clara Novello's singing at Leipzig, which had so charmed the public that "it swears that apart from her there is no salvation!"

In his domestic relations Mendelssohn seems to have been exceedingly happy. Very charming is the account he gives in one of his letters (Leipzig, April 14, 1838) of the birth of his first child:—

"You may jeer as much as you like; I can't help it; it is really too sweet, to see such a tiny little chap, who has brought his mother's blue eyes and turned-up nose into the world with him, and who knows her so well that he smiles at her when she comes into the room; and then when he lies on her breast and sucks like mad, and they are both so pleased—I can't help it, I am too happy!"

Of Mendelssohn's life at Leipzig, many details are given in the sixth section of the present book, which, as regards personal reminiscences, is one of its most interesting portions. Various instances are given of the minute care with which, like Beethoven, he would touch and retouch his compositions before publishing them. One extract on this subject must suffice:—

"One evening, I entered his room, and found him, red in the face, in such a feverish excitement that I was frightened. 'What is the matter?' I cried. 'Here I have been sitting for four hours,' he said, 'to improve a couple of bars in a song (it was one for male chorus) and I can't manage it.' He had twenty versions, most of which would have satisfied most people. 'What you cannot manage in four hours to-day, you will be able to do in as many minutes to-morrow,' I said. He calmed by degrees, and we gradually got into conversation, which kept me in his company till a late hour. Next day he came to me more cheerful than usual. 'After you had gone last night,' he said, 'I was so excited that I could not think of sleeping. At last I composed a little hunting-song that I must play over to you.' He sat down to the piano, and I heard the song that has since charmed hundreds of thousands—Eichendorff's 'Sei gegrüsst, du schöner Wald' ('The Hunter's Farewell'). I hailed it with joyful surprise."

Nothing in Mendelssohn's character is more loveable than his entire freedom from petty jealousy of other composers, and his eagerness to assist them where possible. A charming illustration of this is to be found in a letter, reprinted by Dr. Hiller from the previously published correspondence, addressed to Herr Simrock, the eminent music publisher of Bonn (now of Berlin), recommending Hiller's music to his attention. The earnestness with which he pleads the cause of a brother artist, whose recognition had been less than his talents deserved, is only equalled by the delicacy with which he entreats that no mention of his mediation should come to the ears of him on whose behalf he was writing. Hiller indeed tells us that he first became aware of the fact through the publication, twenty years later, of Mendelssohn's letters.

It is with evident regret that Hiller says that during the later years of Mendelssohn's

life a slight misunderstanding occurred between them, and adds that, though he has reason to know that his friend's personal esteem for him remained undiminished, he considers "the ceasing of his intercourse with the noble man, during his last years, one of the greatest losses he has experienced in his life." The last portion of the book, therefore, contains but few reminiscences; but there is one story told of him in relation to the greatest living lady-pianist, Madame Clara Schumann, which is interesting enough to deserve quotation:—

"In a *matinée* (in the French sense of the word, for it took place in the afternoon) in the house of our dear friend the celebrated painter Bendemann, a great number of amateurs were invited to hear Mendelssohn. Among the audience was Clara Schumann. Mendelssohn played Beethoven's great sonata in F minor—at the end of the Andante he let the chord of the diminished seventh sound on for a long while, as though he would impress it on all the world—then stands up quietly, turns to Clara Schumann, and says, 'But you must play the finale.' She demurs strongly; every one listens attentively for the issue; meanwhile the chord of the diminished seventh hangs, like the sword of Damocles, over our heads. I think it was at last the painful feeling of this unresolved dissonance which induced Madame Clara to yield to Mendelssohn's importunity, and to give us the benefit of the finale. The end was worthy of the beginning; and so it would probably have been had the process been reversed."

The references to Mendelssohn's death are very simple and touching; but the notice of the book has already extended to such length, that further quotation must be spared. Enough has probably been said to give a general idea of its nature, and if it has not already been sufficiently recommended to our readers, probably no words that could be added here would be effectual.

EBENEZER PROUT.

THE first of the Summer Concerts at the Crystal Palace took place last Saturday, when the principal instrumental works performed were Beethoven's symphony in A (No. 7), and Mendelssohn's G minor concerto, splendidly played by Mdlle. Krebs. The remainder of the programme was of a miscellaneous character, the whole of the music being divided into five sections, entitled respectively, Music for the Church, Music for the Concert Room and Theatre, Music for Home, Popular and Patriotic National Songs, and Music for the Ball Room. In spite of the incongruity produced by the presence of the old German chorale "God my King" and Lanner's "Pesther" Waltz in the same programme, the selection was decidedly interesting and attractive.

LAST Monday's Philharmonic Concert—the third of the present series—brought forward Spohr's interesting and thoroughly "Spohrish" overture in F minor (MS.), written in 1820 for the society, and which had not been played in public for upwards of fifty years. The other orchestral works were Bennett's charming *Fantasia-Overture* "Paradise and the Peri"—also composed expressly for the society, the overture to *Ruy Blas* and the "Eroica" symphony. Max Bruch's clever but (excepting the slow movement) decidedly dry violin concerto was admirably played by Herr Straus, who was warmly and deservedly applauded. The execution was as a whole much more satisfactory than at the preceding concert. Madame Lemmens-Sherrington was the vocalist.

THE annual performance of the "Messiah" in aid of the funds of the Royal Society of Musi-

cians took place last night at St. James's Hall, under the direction of Mr. W. G. Cousins. The list of principals announced, all of whom gave their services gratuitously, included the names of Miss Blanche Cole, Miss Maudsley, Madame Otto Alvsleben, Miss Marion Severn, Madame Patey, Messrs. Henry Guy, W. H. Cummings, Thurley Beale and Lewis Thomas. Leader of the band—Mr. Willy; trumpet—Mr. T. Harper; organist—Mr. E. J. Hopkins.

MADAME ANNETTE ESSIOFF, a young Russian pianist, who enjoys a great reputation on the continent, and of whose praises the German musical papers have lately been full, is announced to make her first appearance in England, at the New Philharmonic Concert, next Saturday afternoon, at St. James's Hall.

VERDI's opera *Aida* was produced at the Royal Opera House at Berlin on April 20. It is said by the *Signale* to have been favourably, but not enthusiastically received.

FLOROW's opera *L'Ombra* has been produced at Leipzig, the principal parts being sustained by Madame Artot, Signora Dérévis, and Signori Marini and Padilla.

THE eighth Middle-Rhenish Musical Festival, which was to have been held at Mainz during the coming summer, has been postponed, for local reasons, to next year.

AT this year's Musical Festival in Brunswick, it is proposed to give, among others, the following works:—Brahms's "Rinaldo," Liszt's "Faust" symphony, Berlioz's "Requiem," Erdmannsdorfer's "Schneewittchen," a symphony by F. Dräseke, and a violin concerto by Dietrich.

THE *Musikalisches Wochenblatt* states that Wagner's *Meistersinger* has had so great a success at Breslau, that the railway companies have raised their fares on the occasion of its performances.

A NEW comic opera by Delibes, *Der König hat's gesagt* has been produced with success at Vienna.

THE German musical papers announce, in connexion with the "Liszt Jubilee," which was recently celebrated, that the great pianist has presented to the Hungarian nation not only the whole proceeds of that festival, but his complete collection of artistic treasures at Weimar, merely stipulating that they shall be kept in one room of the museum at Pesth. The *Humia* now learns from a reliable source that the material value of the Weimar art-treasures is at the lowest estimate 400,000 florins, while its artistic value cannot be expressed in figures. From the inventory which has been deposited with a friend of Liszt's the same paper mentions but a few items, such as Beethoven's American piano, Haydn's and Mozart's pianos, numerous jewels of gold and silver, &c. A conductor's baton, set in brilliants—a gift from the city of Vienna—a music-desk of wrought silver, and the great golden crown which the city of Hamburg presented to the *maestro*, also represent large sums of money.

It is proposed to incorporate the Musical Library of the Fratre Filippini, which contains the still unprinted works of Palestrina and other great Italian *maestri*, in the Municipal Library which is about to be organised at Rome from the *membra disjecta* of the numerous treasures which were once enclosed within the walls of the now suspended monastic institutions of Rome.

CHARLES LECOCQ, the author of the well-known opéra-bouffe, *La Fille de Madame Angot*, as also of *Giroflé-Girofla*, now being performed with immense success at Brussels, was born in 1834. His father was an employé at the Tribunal de Commerce, at a small salary. At a very early age Lecocq showed an extraordinary taste for music, and when he was three years old his favourite toy was the flageolet, upon which, without knowing one note of music, he played the popular airs of the

period. His musical precocity greatly interested the music-master of the school where Lecocq learned to spell, and he taught the child to play the play the flageolet correctly, and afterwards also taught him the piano. When sixteen years old, Lecocq entered the Conservatoire at Paris, and obtained the first prize for harmony. At the age of eighteen he was Halévy's best pupil. In 1857 Offenbach originated a competition for young composers, and Lecocq obtained the first prize. The director of the Athénée at Paris entrusted him to write the music for an operetta called *Fleur de Thé*, which placed Lecocq in the front rank of operetta composers. *Fleur de Thé* was played a hundred times at the Athénée, and afterwards at the Variétés. He also produced *Le Beau Dunois* with success. *La Fille de Madame Angot*, having been played two hundred and fifty times at Brussels, and also at Paris and elsewhere, several Parisian directors made very favourable offers to Lecocq if he would write for them; but he declined, saying, "I obtained my greatest success amongst the Belgians, and it is to the Belgians alone I shall give my next piece." *Giroflé-Girofla* was first produced at Brussels, on March 21, at the Alcazar Theatre.

POSTSCRIPT.

SOCIETY OF ANTIQUARIES (Thursday, May 7).

Mr. A. M. FRANKS communicated to the Society the programme of the Historical Congress, which will meet at Stockholm from August 9 to 16. The following subjects will be discussed:—The most ancient traces of Man in Sweden; the Characteristics of the Ages of Stone, Bronze, and Iron; the Ancient Amber Trade with the Shores of the Baltic; and the Anatomical and Ethnological Characteristics of the various Races which inhabit Sweden. Mr. H. Rosse exhibited tracings of wall paintings recently discovered in Swanscombe Church, consisting of portions of two figures and decorative patterns. The figures, Mr. Franks suggested, were intended for the Virgin or some other female saint and St. James. He ascribes the paintings to the fourteenth century. Consul Hutchinson made a few remarks concerning some bronze or copper implements and specimens of pottery which he had discovered in ancient graves in Peru. The sepulchral mounds in that country are the largest in the world. The bodies are wrapped up in cloths, in a squatting position, and inclosed in brick or stone graves. Some specimens of the pottery were modelled to represent the human figure, the faces usually having a projecting nose and prominent eyes.

The Rev. Mackenzie Walcott read a most interesting paper upon the history and statutes of Chichester Cathedral. By the aid of a carefully-coloured plan, he described the gradual building of the cathedral from the transference of the see there from Selsey by Lanfranc. The edifice has been especially unlucky, having suffered two serious fires, in 1114 and 1187, and great injuries at the Reformation and the Civil War, besides the fall of one of the western towers in the seventeenth century. This damage "an eminent architect" in 1684 proposed to remedy by pulling down the other tower, and modernising the whole front. Mr. Walcott referred to the curious story that the cathedral was dedicated to Prester John, and stated that the figure in the dome, supposed to represent that personage, was really a picture of Christ. He also proved that the tomb popularly called the shrine of St. Richard was the tomb of Bishop Adam Molins, who was murdered in 1449. The restoration of the tomb was unfortunately carried out on the former supposition, but documentary and other evidence shows its incorrectness. The foundation consisted of secular canons who had no sinecure. They were bound to attend every service, under penalty of fines for absence, and to show hospitality to their vicars, and all strangers from other parts of the county.

Before the Reformation there was an officer whose duty it was to prepare all the altars for the ceremony of the mass; but in 1611 his duties were altered. At that date he was required to take charge of the cloisters, and scourge out all ungracious boys with their tops, or present them to the old man of the vestry, and to purge the cloisters and church of dogs, hogs, and rude persons. Mr. Walcott concluded with a brief sketch of the doings of Bishop Sherburn, who died in 1536, at the age of ninety, much beloved in the city for his benefactions. His anniversary was kept by a distribution of wine at the city cross, traces of which custom remain at the present day, and he ordered the choristers to have a mighty treat of egg flip, of which Mr. Walcott gave the society the recipe.

M. DORÉ's new picture at his gallery represents Pilate's Wife standing on a staircase with an angel at her left hand; the right wing of the angel is ruddy with the reflected glow of the torches in the deserted bedroom; the left is purple with visionary light. He is opening her spiritual sight to the scene of the morrow in the Praetorium, where Pilate appears, and to much beside. Pilate's wife and the angel stand at the top of the picture, at the spectator's left hand; the scene in the Praetorium faces them; above, and nearer to them on the left, is a balcony, where the oppressed of all ages seem to be stretching their chained hands to the great Victim of oppression; below, at the bottom of the right side of the picture, is a gorgeous agitated group of oppressors; between these is the procession to Calvary, which transforms itself into another procession, which seems meant for the eternal crusade of humanity, with warriors in mail, and prelates with gleaming crosiers, marching up to a cross that gleams amid the hierarchies of heaven.

The individual sufferings of Pilate's wife are rather lost in this mystical phantasmagoria, which, however, will probably add to the artist's reputation with that large section of the public who are thrilled and dazzled by the combination of rhetorical elegance of line, with theatrical solemnities of light and shade. Such work leads to a wider popularity, and is devoted to intrinsically higher subjects than the grotesques by which Doré was first known, so that it can hardly be said that the change in the direction of his art is due to a false ambition. The startling way in which the jewels which are plentifully scattered over the picture sparkle through the twilight of the dream, is perhaps a justification for carrying out the design on an heroic scale in colour.

SALVETAT has lately reported to the Société d'Encouragement of Paris on several experiments showing that porcelain, even in a glazed state, does not possess the property of impermeability to such a degree as has hitherto been commonly supposed. Brongniart showed twenty-five years ago that that material cannot be employed for the air-holder of atmospherical thermometers used for measuring furnace temperatures. In 1872, H. Sainte-Claire Deville drew attention to the percolation of air and water through porcelain. Porcelain painters know from experience that certain pieces have the unpleasant peculiarity of acquiring black faults when the colours are burnt in, because matters which have been absorbed gradually spread and cause an accumulation of carbon in the inner parts, which are protected against the access of air. It has likewise been observed that old pieces of china which have been kept in damp places or buried for any length of time splinter when heated quickly. Salvetat showed an object which had been in contact for several days with a weak solution of fuchsine. Its foot rested on an unglazed ring-shaped support, which ensured a gradual advance of the liquid into the interior of the mass, and the deposition therein of a considerable amount of colouring matter. Now the object, which appears white from outside, on being held up against a lamp, shows a bright fiery red. This

circumstance may be advantageously applied in the decoration of certain articles. The porosity of porcelain may be increased by the addition of substances rich in silica, so that the glazing may not be thorough. Certain parts, intended to be covered afterwards with decorations of some kind, would have to be left unglazed, and the colouring lac may then be introduced through them. In this wise very effective objects, such as lampshades, might be produced in which the hidden colouring only appeared under certain conditions. Salvetat has published these particulars to prevent them becoming later the object of a patent.

A PICTURE by Murillo, entitled *El Pastorcillo*, was sold in Paris on Friday week for 120,000 francs. It represents the child Jesus standing, with trees and landscape in the background; the head, a three-quarters view, looks toward heaven; he is clothed in a rose-coloured dress, the upper part of which is covered with a lamb's skin; in the left hand he holds a shepherd's hook, on which he leans, and in the right the strayed lamb which he is bringing back to the fold.

A LARGE and valuable collection of ancient charters and manuscripts has recently been found in the crypt of Canterbury Cathedral. This important discovery having been brought before the notice of the Historical Manuscripts Commissioners, they have authorised the Rev. Canon Robertson to prepare a full account of them, which will be printed in the Fifth Report of the Commission.

A MEETING of the Historical Manuscripts Commissioners was held at the House of Lords on Thursday. There were present: Earl Stanhope, in the chair; Lord Acton, Lord Edmond Fitzmaurice, Sir T. Duffus Hardy, and the Rev. Dr. Russell.

THE building of the Literary Museum at Göttingen is to be ornamented with tablets, inscribed with the names of the most distinguished *alumni* of the University. The tablet dedicated to K. O. Müller has already been affixed, and those bearing the names of the brothers Grimm, Heyne, Pütter, and Hugo will shortly follow.

It is particularly requested that all letters respecting subscriptions, the delivery of copies, and other business matters, be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The legend of Jubal and other Poems. By George Eliot. (London: Blackwood & Sons.)

It is always instructive when a great painter turns sculptor, or a great musician turns dramatist, or a great poet turns novelist, or, as in the present case, a great novelist turns poet; there is always something fresh to be learnt about the powers and the impulses of the artist, which have to find a fresh channel for themselves; there is always something to be learnt also about the limits of the old channels, which no longer seem enough. This is so especially in the case of such a personal spontaneous genius as George Eliot, all whose writings are necessary to the complete expression of herself, with whom we are entirely safe from mere echoes of other writers, which express nothing except an over-ambitious sympathy. Even shortcomings have their meaning and their interest when they are visibly due not to any defect of training or elaboration, but to the habitual predominance of other faculties than those which are most helpful to the work in hand. A great thinker cannot wait while fancy and emotion grow up into thought; the thought must always be there; and sometimes the fancy and emotion grow over the thought luxuriantly, and sometimes, though the overgrowth is always healthy, the thought shows through.

In the *Spanish Gypsy* there was a constant incongruity; the whole conception was poetical, and verse was obviously the only appropriate vehicle for the most dramatic movements of the story; but there were long intervals where the action flagged or was positively pushed aside by commentaries and discussions, or was overlaid by ornament; and it was hardly a compensation that the commentaries were an overflow of intellectual sympathy with the situation, and that the ornaments showed how much diligent and refined observation had fed the writer's imagination of the scenery. The present volume is on a smaller scale than the *Spanish Gypsy* or most of the author's works in prose, and it contains at least one poem, the eleven sonnets entitled "Brother and Sister," which is all but perfect—more delightful, if possible more classical, than the parallel passages in the *Mill on the Floss*. In the novel there is no doubt more human, more concrete individual reality, but in the poem we gain what is even more precious, an unbroken ideal medium, in which what is harsh and grotesque is wholly suppressed, in order that what is permanent and beautiful and memorable may appear unalloyed. Nearly every sonnet contains gems like these:—

"I held him wise, and when he talked to me
Of snakes and birds, and which God loved the best,
I thought his knowledge marked the boundary
Where men grew blind, though angels knew the
rest!"

"all at home were told the wondrous feat,
And how the little sister had fished well.
In secret, though my fortune tasted sweet,
I wondered why this happiness befell."

"The little lass had luck," the gardener said:
And so I learned, luck was with glory wed."

"His years with others must the sweeter be
For those brief days he spent in loving me."

If the "Brother and Sister" show the superiority of verse over prose for presenting a subject *sub specie aeternitatis*, "Arm-gart" shows the superiority of the same instrument for expressing the fulness of passion which the growing reticence of modern civilisation tends to repress, till it is probable that it will ultimately be extinguished like a fire deprived of air:—

"Bear witness, I am calm. I read my lot
As soberly as if it were a tale
Writ by a creeping feuilletonist, and called
'The Woman's Lot; a Tale of Everyday';
A middling woman's, to impress the world
With high superfluity: her thoughts a crop
Of chick-weed errors or of pot-herb facts,
Smiled at like some child's drawing on a slate.
'Gentle?' 'O yes, gives lessons; not so good
As any man's would be, but cheaper far.'
'Pretty?' 'No; yet she makes a figure fit
For good society. Poor thing, she sews
Both late and early, turns and alters all
To suit the changing mode. Some widower
Might do well marrying her; but in these days! . .
Well, she can somewhat eke her narrow gains
By writing, just to furnish her with gloves
And droschies in the rain. They print her things
Often for charity.'—O a dog's life!
A harnessed dog's, that draws a little cart
Voted a nuisance!"

It is impossible to write with more severity and compression of style, and yet the effusion of feeling would have been excessive in prose. Again, the verse certainly adds lightness and elevation to the bitter gaiety of Leo's answer, when asked whether he expects his music to live when he is dead:—

"Pfui! the time was I drank that home-brewed wine
And found it heady, while my blood was young:
Now it scarce warms me. Tiptle it as I may,
I am sober still, and say, 'My old friend Leo,
Much grain is wasted in the world and rots:
Why not thy handful?'"

On the other hand, the description of Arm-gart's reception by the house rather convinces us of the insufficiency of prose than of the sufficiency of verse, and there are passages like the invention of butter in "Jubal," where what would have been easy and familiar in prose becomes strange without becoming beautiful in verse; and in "A Minor Prophet" there is a puzzling allusion to "astral cocoa-nuts," which exemplifies a rather common fault of subtle and reflective poetry. The writer sees that many things must always be left to the reader to comprehend at half a word, and it is only in popular poetry that a traditional understanding exists to determine which.

Of course, the only reason for speaking of such things is that they intrude themselves on the attention less when they have been noticed and explained. It is a pleasanter and more profitable study to compare "How Lisa loved the King," with its original in Boccaccio, and see how the modern writer has enlarged and deepened the meaning of the story without impairing its essential simplicity. Boccaccio keeps throughout to the tone of mere kindly courtesy with which well-bred people tell a graceful interesting story. He does not

dwell for a moment on the historical position of King Pedro, though the story is a Ghibelline reply to a story of the temperance of King Charles whom Pedro dispossessed, nor on the growth of Lisa's passion, nor upon the spirit in which she accepted her happiness. What might have been seen and heard is enough for him, and out of this he makes one of the best of his prose idylls, and in all that he says, with one exception, George Eliot follows him closely. The justification of, and the originality of her poem is the wealth of brooding feeling which is poured into the space which Boccaccio has left blank. The central point both of the story and of the poem may be said to lie in the song which tells Pedro the tale of Lisa's hopeless love. Boccaccio is deliciously sweet, and musical, and genuine, but he does not get beyond the shy broken sob of animal feeling and innocent helpless pain; the singer feels the pathos of this side of the situation too much to care to intellectualise it; the approaching death of the love-lorn maiden simply measures the ardour of her hopeless passion; whereas in George Eliot the worship of Death becomes the key-note of four lovely stanzas, of which the last is the climax:—

"Tell him, O Love, I am a lowly maid,
No more than any little knot of thyme
That he with careless foot may often tread;
Yet lowliest fragrance oft will mount sublime
And cleave to things most high and hallowed,
As doth the fragrance of my life's springtime,
My lowly love, that soaring seeks to climb
Within his thought, and make a gentle bliss
More blissful than if mine, in being his:
So shall I live in him and rest in Death."

The glorification of Death is of course the burden of "Jubal" it reads throughout almost like an answer to the early numbers of the *Earthly Paradise*, and the impression is all the stronger because the music of the answer is so often like an echo of the music of the challenge. In both the discussion is carried on, as it ought to be, rather in accordance with the logic of feeling than the logic of signs. Mr. Morris's contention is that it is precisely when life is at its best that the thought of death poison, it. George Eliot maintains, with Feuerbachs that it is death at a distance which gives life all its value, and death at hand which puts the seal upon life. When Jubal returns in old age and finds his memory worshipped—

"All was forgotten but the burning need
To claim his fuller self, to claim the deed
That lived away from him, and grew apart,
While he, as from a tomb, with lonely heart,
Warmed by no meeting glance, no hand that pressed,
Lay chill amid the life his life had blessed.
What though his song should spread from man's
small race
Out through the myriad worlds that people space,
And make the heavens one joy-diffusing quire?
Still, 'mid that vast would throb the keen desire
Of this poor, aged flesh, this eventide,
This twilight soon in darkness to subside;
This little pulse of self that, having glowed
Through thrice three centuries, and divinely stowed
The light of music through the vague of sound,
Ached smallness still in good that had no bound."

After his rejection the solution is:—

"Yea, art thou come again to me, Great Song?"
The face bent over him like silver night
In long-remembered summers; that calm light
Of days which shine in firmaments of thought,
That past unchangeable, from change still wrought.
And there were tones that with the vision blent:

He knew not if that gaze the music sent,
Or music that calm gaze: to hear, to see,
Was but one undivided ecstasy:
The raptured senses melted into one,
And parting life a moment's freedom won
From in and outer, as a little child
Sits on a bank and sees blue heavens mild
Down in the water, and forgets its limbs,
And knoweth nought save the blue heaven that
swims.

'Jubal,' the face said, 'I am thy loved Past,
The soul that makes thee one from first to last.
I am the Angel of thy life and death,
Thy outbreathed being drawing its last breath.
Am I not thine alone, a dear dead bride,
Who blest thy lot above all men's beside?
Thy bride whom thou wouldst never change, nor
take
Any bride living, for that dead one's sake.'

Of course, if any one were foolish enough to attempt to translate this into the logic of signs, he would expose himself to the obvious observation that it is no more in our power to possess ourselves of our whole past than of the whole future of our work, and that, therefore, it is idle to teach that we ought to be content to have our past for ourselves, and give up our work to the world: seriously, if we are to expect either for ourselves, we have an equal right to expect both from the liberality of a Power able to do abundantly above all that we can ask or think.

The fact is, that there are problems presented by the permanent facts of the world which can only receive an objective solution, if at all, from paramount facts which show that the best which we can apprehend in the little that we know is supreme in the much which we do not know in this life; but whatever objective solution we adopt, or whether we despair of any, we need a subjective solution for the subjective problem presented by the alternations of our own moods. Such a solution has never been given more worthily than in "Jubal," and in the glorious lines beginning "O may I join the choir invisible," which form the Epilogue of the volume, and make the positivist heaven for the first time intelligible and desirable, because for the first time the conception has been lifted above the level of controversy, from which it suffers even more than the majority of religious conceptions, since there are few which are so open to be taunted with unanswerable questions.

Indeed, the whole volume is a splendid homage to the great principle of the inherent supremacy of feeling over thought which it is one of Comte's chief merits to have formulated, though he shrank from its legitimate consequences, which is not surprising when we remember whence he took it. And this gives an artistic value and completeness to the poetry of George Eliot which is missing in some measure in her prose works. Though the latter are richer and more varied and more masterly, the writer seems constantly trying to escape into the atmosphere of high impulse and momentary feeling in which the poems move habitually. The love of Lisa is an exquisite satisfaction to the perilous and invincible desire

"With dream fruit dream wishes to fulfil."

Throughout "Armgarth," her single-minded impetuosity is contrasted with the essential unexceptionable baseness of the Count, so as to

show how ruinous it is simply to be consistently reasonable in matters of conduct,

"And by what is what will be to define."

Armgarth's impulsiveness is, in fact, the key to the whole poem; she aggravates her loss by her eagerness to measure it, and the particular form of her resignation is very much a matter of accident; it would have been easy to find practical and ideal reasons if they were the thing required to show that her talent as an actress was too good to be wasted, and that it would be foolish to destroy the chance of her voice recovering itself by teaching. It would have been equally easy to prove that her tardy sympathy for Walpurga and Leo (it is an admirable trait that Walpurga accuses her while she accuses herself to Leo) was a motive for generalising her revolt, not for subsiding into submission; but the poet resists the temptation to a systematic intellectual pessimism as she resists the temptation to a systematic intellectual optimism which would have made the moral change in Armgarth a compensation for the loss of her voice.

The only approach to a glorification of right reason is the very interesting poem on "Stradivarius," who defends his simple straightforward perfect work triumphantly against a painter Naldo,

"Knowing all tricks of style at thirty-one,
And weary of them;"

who tells Stradivarius—

"Thou art little more
Than a deft potter's wheel, Antonio;
Turning out work by more necessity
And lack of varied function. Higher arts
Subsist on freedom—eccentricity—
Uncounted inspirations, influence
That comes with drinking, gambling, talk turned
wild,
Then moody misery and lack of food—
With every dithyrambic fine excess."

Only when we remember that Southey worked, and prepared himself for work, on the principle of Stradivarius, and that Hoffmann and Byron prepared themselves for work on the principles of Naldo, and compare the value of their work, we see how hard it is to draw universal inferences from the best selected facts. No one would be less disconcerted by this difficulty than the author who combines the most resolute and exalted hope with a keen perception of the ridiculous nature of all Utopias, which are a premature attempt to anticipate in detail the realisation of aspirations which it is well to cherish.

Not even the conclave at the Rainbow shows a sharper sense of humour than the "Minor Prophet," an American vegetarian and spiritualist, who holds—

"That Thought was rapping in the hoary past,
And might have edified the Greeks by raps
At the greater Dionysia, if their ears
Had not been filled with Sophoclean verse;
And when all Earth is Vegetarian—
When, lacking butchers, quadrupeds die out,
And less Thought-atmosphere is reabsorbed
By nerves of insects parasitical,
Those higher truths, seized now by higher minds,
But not expressed (the insects hindering)
Will either flash out into eloquence,
Or better still, be comprehensible
By rappings simply."

"Two Lovers" is a very touching picture of the stages of a life-long affection, only the

ejaculatory lines at the end of each stanza hardly communicate the depth of feeling out of which they come. "Arion" is an almost successful attempt to show that half of a legend which a scientific age can accept may be made more than the whole. Here are the two last stanzas:—

"The last long vowels trembled then,
As awe within those wolfish men:
They said, with mutual stare,
Some god was present there.
But lo! Arion leaped on high
Ready, his descent done, to die;
Not asking 'Is it well?'
Like a pierced eagle fell."

G. A. SIMCOX.

Congregational History, 1567-1709, in Relation to Contemporaneous Events, and the Conflict for Freedom, Purity, and Independence. By John Waddington, D.D. (London: Longmans & Co., 1874.)

DR. WADDINGTON aspires apparently to be the Strype of English Congregationalism. Respecting the merits and shortcomings of that eminent compiler there can be but little difference of opinion. He had honesty, indefatigable industry, and a large acquaintance with facts; but he was also singularly deficient in judgment, he had no conception of lucid or symmetrical arrangement, and even those who have been most indebted to his labours must have often closed his volumes with feelings among which gratitude was, at least, not predominant. In these latter qualities Dr. Waddington undoubtedly strongly resembles his predecessor; it is rarely that we have opened a historical work and found it so difficult to sustain our attention and preserve the thread of the narrative. His pages supply good material for a book, but at present the volume is little more than history in embryo. He gives numerous extracts from the State Papers, from the Harleian, Lansdowne, Sloane, and other collections of manuscripts, but these are singularly unequal in value, and not a few have already appeared in print, while the carelessness with which they have been put together is inexcusable. Many are given without any reference to the source from whence they are derived; and though there is but little Latin in the book, whenever a passage occurs it is generally misspelt. "*Ipsa mutatio consuetudinis, etiam quae adjuvat utilitate novitate perturbat*,"—such is the version of Augustine's well-known *dictum* which he attributes, in large italics, to our English Solomon! But this is trifling compared with what greets us a few pages further on (p. 364), where Dr. Waddington introduces us to the controversy between Bishop Hall and the Smectymnuans. After adverting to an array of authorities adduced in the *Defence of the Humble Remonstrance*, he says, "All this might be received as profound learning by 'John A. Noakes and John A. Styles,' but it could not deceive those who replied to the remonstrance under the pseudonym *Smectymnus*." *Smectymnus* for *Smectymnuus*! And as if to prove that it is his deliberate opinion that this is the true orthography, he again gives us the name where it has not the slightest business to appear—at the commencement of a long

extract from the "Vindication" of Smectymnus himself. Of this the first words, as here printed, are, "We begin with what he" [i.e. Bishop Hall] "brings out of a Smectymnus Samaritan Chronicle." Here the reader begins naturally to pause and stare, and to wonder whether he or the book is bewitched. A *Smectymnus* Samaritan Chronicle!! "Smectymnus" is of course a gross blunder that has somehow or other crept into the transcript of the passage, and, by a yet greater oversight, has been allowed to pass without being struck out in the proof. Two lines further on, the title of Joseph Scaliger's great work is given as *Emendat Temporum*; and this again is succeeded, at a like interval, by the following choice specimen of Latinity: "Gens est totius vestutatis, etiam quae ad ipsos pertinet ignorissima." The gem of this wonderful page, as will presently be seen, yet remains: Scaliger, as quoted by the Smectymnans, says, in referring to the Samaritan Chronicle, "Is liber incipit ab excessu Mosis, desinit infra tempora Imperatoris Adriani;" Dr. Waddington prefers to give us "incipet" for "incipit," and "desinit" for "desinit;" though it were enough, one would think, to make Joseph Justus Scaliger turn in his grave, to be credited with such Latinity.

Now, if these misprints had existed in the original edition, "printed for John Rothwell, at the *Sunne* in Paules Church-yard, 1641," Dr. Waddington might have pleaded, as Milton does in defence of the hard-pressed Smectymnans in their use of the form *Areopagi*, that he was "not making Latines," and the plea might have had some force. But the fact is, as a comparison with the original will show, none of these errors, not even the omission of the full stop after *Emendat*, or of the comma after *pertinet*, are to be found in the edition from which the transcript has been taken. It would, of course, be natural to conclude that the sheet had accidentally gone to press without being read either by the "reader" or the author, but unfortunately internal evidence renders it impossible to fall back upon this charitable hypothesis. It so happens that in the original edition, in the quotation from Scaliger, the last *i* in *incipit* has lost the dot; it is, beyond all doubt, an *i*, but is a defective letter, and so looks a good deal like an *e*; while the *s* in *desinit* again is the old fashioned character that so strongly resembles an *f*. It is evident therefore that the transcriber was thus led to make the two errors which appear in the last quotation in Dr. Waddington's page. But what, it may be asked, can be thought of the critical sagacity that could thus easily be led astray? and when we find that a writer cannot transcribe a page of a legibly and correctly printed book without blunders like these, with what confidence can we accept a series of quotations from manuscripts, many of which, as is well known, tax the skill of our most accomplished experts? To say nothing, however, of the errors in the Latin, it is evident that Dr. Waddington has forgotten, if indeed he ever knew, that the name *Smectymnus* was formed from the initial letters of the names of the five Puritan authors of the pamphlet. Of these the fourth was Matthew Newcomen, whose initials Dr. Wadding-

ton has transposed. The fifth was William Spurstow; as, however, the *w* could not form a syllable, it was printed as two *u*'s, one of which the Doctor has struck out, on the ground, it is to be presumed, of seeming superfluity. It is quite unnecessary to explore the manuscripts in the British Museum to discover this; he will find an excellent account of the whole controversy in the second volume of Mr. Masson's *Life of Milton*. As it is, this strange conglomerate of blunders follows directly upon a contemptuous allusion to the learning of Bishop Hall. Hall, to be sure, was not the most learned Englishman of his day; he was inferior in this respect to Milton, to Selden, and to Ussher; but we feel certain that no one page that he ever printed and corrected was disfigured by such gross inaccuracies as these. We imagine Dean Hook, while engaged on his forthcoming life of Whitgift, turning to this volume to see whether the compiler has discovered anything new respecting Cartwright: what an impression it must give him of the average learning of the Congregational divine!

The period embraced in these pages includes two very distinct phases of English Puritanism—that of which Cartwright was in some measure the representative, and that which more nearly reflects the spirit of Robert Brown. The difference between the two men was as great as it could well be where there was so much in common. Cartwright, though intemperate in his younger days, was always the man of genius and the scholar; his disposition was benevolent, his heart large, and his views were broad. Beza thought him better qualified than himself to undertake the confutation of the Rhemish version of the New Testament. He was a reformer but not a separatist; he disapproved of the powers with which the bishops were invested and of their general policy in his day, but he still wished to remain in the communion of the Church of England. Brown—of whom Fuller said that "he had a wife with whom for many years he never lived, and a church wherein he never preached"—was a man of an entirely different stamp, and it was only owing to Lord Burleigh's influence that he retained to his death his living in that Church which he was doing his best to pull down. Something of the disfavour with which the Independents were long regarded must probably be attributed to the character and career of their founder.

Dr. Waddington shows no anxiety to exculpate the Puritans in the matter of the Martin Marprelate tracts, but it is to be inferred that he considers that the authorship of those scurrilous productions is not chargeable on their party, when he observes, "Not a word can be found in their papers seized by the authorities incompatible with the most disinterested zeal for the peace and highest welfare of their country. It was but the simple truth when they declared their willingness 'to spend their blood against the Pope and the Spanish King.'" There is a simplicity in the last assertion which is rather amusing, while the epithet "disinterested" is really about the last that should have been selected. Surely Dr. Waddington does not require to be reminded that the

Puritans of England in the year 1588 were perfectly aware that not only their own safety but that of all the Reformed Churches largely depended on the stability of Elizabeth's throne, and that, if the Roman Catholic party succeeded in assassinating or dethroning her, the bonfires of the reign of Queen Mary would probably be relighted in tenfold numbers? The marvel is, how in this same year 1588—the year that saw the execution of Mary Queen of Scots and the Spanish Armada, and when the assassination of Philip the Silent was still fresh in the minds of men—any section of the Puritan party could be so reckless as to single out those who represented the supreme authority in Church and State for such unmeasured vituperation. We may believe John Penry to have been as innocent as Cartwright of any complicity in the authorship of the Marprelate tracts, but it is impossible not to perceive that those productions were the composition of men holding Puritan views.

Taking the volume as a whole, if intended to show that freedom of religious belief has often been suppressed in this country by cruel, arbitrary, and unjust legislation, it appears hardly to have been needed in order to prove what is so indisputable; but if, as Dr. Waddington seems to imply, it is designed to convince us that if Puritanism could only have become the dominant religion of the land, "freedom, purity, and independence" would have everywhere prevailed, he seems hardly to have made out his case. In fact, his own research supplies arguments against him. To say nothing of the unjust severity with which the Quakers were treated in the days of the Commonwealth, we see that when he comes to speak of the Puritans of New England he is compelled to admit that they, in turn, employed against other creeds those coercive measures from which they had themselves suffered so severely. He touches very slightly and very tenderly on this point, and greatly prefers to dilate on the sufferings of the Puritan colonists in their adopted country, as though, on his own showing, the hardships endured by the Church of England colony were not at least as severe. As it was, in both Massachusetts and New Haven, attendance at church was compulsory on all, while church membership was a condition of the franchise; and thus the theory of a state church was in reality set up in far greater completeness than on British soil. Facts like these have given no little force to Dr. Döllinger's arguments in his *Kirche und Kirchen*, and he has not failed to point to the fact that the first transatlantic state in which entire liberty of conscience was proclaimed was the Roman Catholic state of Maryland. The Puritan policy was, in fact, a renunciation of their own principles, and all Dr. Waddington seems to be able to say in their defence is that they passed their enactments "in an evil hour," "in the vain hope of keeping the colonies free from the intrusion of those who might disturb their ecclesiastical peace;" "the safety of the colonies," he says, "depended on their order and unity." This is all very well; but in the meantime the poor Baptists had a hard time of it, and it is evident that precisely the same pleas might have been advanced by Elizabeth or Laud.

The truth is, that when the student of history has once grasped the fact how very imperfectly the theory of liberty of conscience was understood in past times, the standard by which he must, for the most part, be content to decide on the merits of a coercive policy at successive periods, is whether it was justified by the apparent exigencies of the State? When Philip II. carried fire and sword into the Netherlands, his primary object was the extirpation of a creed professed by those who were nearly all peaceable, industrious, and loyal subjects; when Elizabeth persecuted the Catholics, she did so under the belief (which was perfectly warranted by the facts), that if the Catholics gained the ascendancy neither her throne nor the Church would last a twelvemonth. Even her severity towards the Puritans had a kind of political excuse, in that she sought thereby to win, as she succeeded in doing, the confidence of the Anglican party. It is a serious anachronism of judgment which Dr. Waddington and writers of his school import into history, when they seek to decide on each question solely by abstract principles. Of a large section of the later Puritans it is about as reasonable to say that they contributed to bring about religious freedom, as it would be to assert that the smugglers of the last century were the apostles of free trade. The reason that religious freedom is now so largely enjoyed is not so much that the old arguments have prevailed, as that it has been found that they may be safely admitted in practice. Lord Macaulay in his *History* has pointed out the almost ludicrous contrast between the lofty pleadings and splendid rhetoric of the *Areopagitica*, and the prosaic, matter-of-fact considerations whereby the House of Lords was ultimately prevailed upon to concede the liberty of the press. Freedom of thought and action, if a birthright, is rarely actually realised before the majority of the community have arrived at the age of discretion; and perfect freedom will be realised only when each individual member of the community shall have been so trained as habitually to subordinate his interests to those of the community at large.

J. BASS MULLINGER.

Calendar of State Papers (Domestic Series) of the Reign of Charles I. (1639), preserved in Her Majesty's Public Record Office. Edited by William Douglas Hamilton, Esq., F.S.A., of Her Majesty's Record Office, &c. Under the direction of the Master of the Rolls, &c. (London: Longmans & Co., 1873).

THIS volume, consisting of 544 pages of Calendar and 64 pages of index, besides the Editor's Preface, traverses the six months from the beginning of April to the end of September, 1639. The documents, it will be seen, are unusually numerous for so short a period. This, however, is matter for congratulation, inasmuch as the period is one of sharp crisis, full of incidents interesting yet on their own account, and pregnant with the still greater events that were to come. Mr. Hamilton has performed his editorial part well. The documents seem to be faithfully described and abstracted, with a due perception of those that are most

important; and the Preface indicates, with clearness and brevity, what features of the history of Great Britain in Charles's reign the documents chiefly illustrate.

"The distinguishing feature," says Mr. Hamilton, of the half-year which the volume includes "was the inception and conclusion of the first Northern Campaign against the Covenanters." In other words, whoever would study minutely that so-called *First Bishops' War*, or war between Charles and the Scots on the question of episcopacy, which was the means of rousing England from her ten years of despairing lethargy under the "Reign of Thorough," and which gave the signal for the great English Revolution of the next twenty years, will find ample materials in the present volume. Here, with only a sufficient knowledge beforehand to enable him to interpret the documents, he will see the Scotland and the England of that far-back time rise up before him in more vivid picture than he could have supposed possible, and will witness the brief shock of their collision, and its immediate results. First, in April 1639, there is Scotland, filled from end to end with enthusiasm for that Covenant of Religion to which she had sworn twelve months before, and for that subsequent abolition of Episcopacy and restoration of Presbytery in her Kirk which had been the great business of the Glasgow Assembly of November and December, 1638; nay, not only filled with enthusiasm from end to end, but armed and drilled from end to end, and grimly waiting to try conclusions with Charles in the field, should he come north, as he had threatened, with an English army, to suppress the Covenant and restore the bishops. At the same time there is England, grievously distracted by the Scottish business—Charles, indeed, resolute in his enterprise for the chastisement of the Scots, and already at York for the purpose, and pressing on the musters in the English shires, and drawing them gradually north; but the main part of the English people dreadfully reluctant in the enterprise, and questioning its justice, and the Puritans more especially sympathising with the Scots at heart, and expressing their sympathy in ways which taxed the utmost vigilance of the Home Office and the various local authorities. Next, in May, we have the gradual approaching of the two armies,—the English army, commanded in chief by the Earl of Arundel, but with the Earls of Essex and Holland under him, and with Charles present in person, while a fleet, under the Marquis of Hamilton, was already in the Firth of Forth to assist; and the Scottish army, commanded in chief by Field Marshal Sir Alexander Leslie, and officered under him by the leading Covenanting nobles, well mixed with Gustavus-Adolphus veterans of his selection. The last days of May and the first of June saw the armies encamped within a few miles of each other; Charles and the English at Birks, near Berwick-on-Tweed; and Leslie and the Scots on Dunse Law, in Berwickshire. A great pitched battle was expected; but it was Leslie's part to let the King bring it on by actually crossing the Tweed and invading Scottish territory. As it chanced, however, there was to be no real battle after all. One

or two invading raids had been repelled by the Scots, when the King, comparing the state of his own army, ill-disciplined, disaffected, and all but mutinous, with that of Leslie on Dunse Law, foresaw that a conflict would end in his total defeat. It was, accordingly, conveyed to the Scots that his Majesty, anxious to spare bloodshed at the last, would be willing to treat, if duly solicited. The Scots, equally ready for that alternative as for the other, made the due solicitation; and, after about a fortnight's negotiation, there was arranged the so-called Pacification of Birks, or Pacification of Berwick (June 18), by which Charles virtually conceded to the Covenanters all their demands, and consented that his Scottish kingdom should in all time coming enjoy the Presbyterian Kirk-government which she preferred, with free General Assemblies of the Kirk for Kirk affairs, and free Parliaments for affairs of State. He would himself, it was signified, immediately enter Scotland graciously, in token of the happy reconciliation, and give his royal attendance at one such Assembly and one such Parliament, presently to meet for the further settlement of details. But the mood of graciousness was brief. The English army had been disbanded, and the men had returned gladly to their homes; but Charles, remaining at Berwick till the end of July, had grown more and more discontented with the peace to which he had been forced, and more and more irritated with the exultation of the Scots over their victory, and with the signs of sympathy with them among the English Puritans. On August 3, accordingly, he was back in London, without having bestowed on Scotland the expected honour. The Scottish General Assembly and the Scottish Parliament duly met in Edinburgh that month; but before the end of September it was but too evident that the Scots could not consider the quarrel over between them and their Sovereign in London, but must be prepared for a *Second Bishops' War*, to be hurled upon them as soon as means could be found.

Every point and passage in this six months' series of events is illustrated by the contemporary documents calendared in the present volume. A specimen or two may suggest the wealth of historical particulars and of personal anecdotes and revelations which the documents supply.

On April 25, 1639, the King being then at York, but on the move for the Scottish border, a printed proclamation was issued in his name, to precede him into Scotland, explaining his motives, and ordering the Covenanters to return to their allegiance, and to signify the same by at once laying down arms and restoring the royal castles and other strong places they had seized. In this printed proclamation there are threats of severe pains and penalties against those who should hold out; but no persons are named as already exempt from mercy. It now appears, however, that this printed proclamation was a milder version of one which had been previously drafted by Sir John Hay, the Scottish Clerk-Register, and which is extant in MS., with notes in Charles's own hand, among the State Papers. In that original draft certain Scotsmen are

excepted beforehand from all hope of the King's clemency:—

"So gracious shall we show ourselves in this business and the managing of it," runs one of the paragraphs of the Draft, "as that, though we know there hath been many great movers in this grievous treason, yet we shall be content to pass by all of them, except the very prime and principal leaders in this sedition—namely, Archibald Campbell, Earl of Argyle; John Leslie, Earl of Rothes; James Graham, Earl of Montrose; John Elphinstone, Lord Balmerino; John Campbell, Earl of Loudoun; John Hay, Lord Yester; James Lyon, laird of Aulbar; Sir George Striveling (Stirling), laird of Keir; Sir William Douglas of Cavers, sheriff of Teviotdale; Sir Patrick Hepburn of Wauchton; Henry Rollock, minister at Edinburgh; David Calderwood, formerly banished; Alexander Gibson of Dunse [a misprint: it should be Durie], Clerk of the Session; Archibald Johnstone, pretended clerk to the late pretended General Assembly; John Smyth and David Junkyne (Jenkins), burgesses of Edinburgh; Gabriel Cunningham, burgess of Glasgow:—but, as for them, we hereby declare them and every one of them traitors to our person, estate, crown, and dignity."

In a subsequent paragraph "Sir Alexander Leslie of Balgonie, and Colonel Alexander Hamilton," are added on special grounds. There were, therefore, altogether, nineteen persons among the Covenanters whom Charles or his Scottish advisers had marked as the culprits in chief; and they were doubtless the persons with whom it would have gone hardest, had Charles succeeded in his enterprise. Now, though we should have guessed most of the nineteen from independent information, the document is interesting as exhibiting some names in Charles's supremely black list of Scotsmen for April 1639 that we should not have expected to find there, and as omitting some that we should have expected to find. For example, that Stirling of Keir was one of the original Covenanters is well known; but his subsequent association with Montrose in the ranks of Scottish royalism has caused us to forget (though we never do the like in Montrose's own case) how conspicuous a Covenanter he must have been. Again, why is Alexander Henderson, the chief of Scottish Presbyterian clergy, the Moderator of the great Glasgow Assembly that had set the King at defiance, and the head and brain of the whole movement so far as it was ecclesiastical, omitted from the black list, while it includes such minor clerical personages as Henry Rollock, of Edinburgh, and David Calderwood, the tough old historian of the Kirk?

The state of the English army in the north, the changes of the King's mood as he approached the rebellious land of his birth, the varying rumours that were wafted to him and to those about him from Scotland as to the movements and intentions of the Covenanters, the sense of check-mate that came over him and his advisers when they found themselves at length face to face with Leslie in his full strength on Dunse Law, the sudden lapse at that moment from majesty militant and threatening to majesty humbled and negotiating, the progress of the negotiations themselves from their beginning to their issue in the Pacification of Berwick, are all amply illustrated in official documents and in the private letters of various correspondents. Among the most spirited of

these private letters, and the fullest of gossip, are those written by Edward Norgate, clerk or under-secretary to Secretary Coke (the secretary who had accompanied the King), and addressed to Robert Reade, the under-secretary and nephew of Secretary Windebank in London. There are also some curious letters, addressed to the same Reade, or to Secretary Windebank himself, by Thomas Windebank, the secretary's eldest son, who had gone north in personal attendance on the King. Perhaps the most memorable quotation in the entire Calendar is that from a letter of this young gentleman to his cousin Reade, dated "Berwick, June 22," i. e. just after the Pacification with the Scots:—

"We have had a most cold, wet, and long time of it, living in the field," he says, "but kept ourselves warm with the hopes of rubbing, fubbing, and scrubbing those scurvy, filthy, dirty, nasty, lousy, itchy, scabby, . . . slovenly, snotty-nosed, logger-headed, foolish, insolent, proud, beggarly, impertinent, absurd, grout-headed, villanous, barbarous, bestial, false, lying, roguish, devilish, long-eared, short-haired, damnable, atheistical, puritanical crew of the Scotch Covenant. But now there is peace in Israel!"

Our last glimpse of this humorous son of Secretary Windebank in the present volume is in a letter to Reade of four days later, also from Berwick:—

"The King," he there says, "has bestowed the honour of knighthood on divers of his servants; but I have not been so forward as to desire it, and so go without it, and the truth is I should not take it for an honour now to have it, after so many of my inferiors."

One hears of him occasionally, however, in other documents through the next six years, and last of all on May 3, 1645. Then, as Colonel Windebank, an officer in the King's service in the Civil War, he was shot to death at Oxford, by sentence of court-martial, for alleged cowardice in having surrendered Blenheim House to Cromwell when he might have resisted.

Though the *First Bishops' War with the Scots* may be said to be the chief theme of this volume, it disinters many curious documents illustrative of the state of English society towards the close of the "Period of Thorough," and especially of the unimpaired strictness at that time of Laud's ecclesiastical rule. Two examples must suffice.

One hears afterwards of a sect of English Puritans, or Separatists, called "the Traskites," whose peculiar tenet it was that the Jewish Sabbath, or seventh day of the week, was perpetually to be observed, and that the substitution of the first day, or Christian Sunday, was unwarranted. The founder of this sect, or perhaps only its reviver, was a poor man, John Trask, who had been Star-Chambered, pilloried, whipped, and imprisoned for his heresy, as long ago as 1618. After he had been imprisoned for a year or two, he had published a recantation; but, on being released, he had again relapsed, and had been again in trouble, ended only by his death in Lambeth in some obscure way. His wife seems to have survived him, and to have been most resolute for his heresy. Under date "August 31, 1639," at all events, there is a memorandum by some anonymous person, intended for Laud's eye, in which the writer, after de-

scribing the riotous funeral, in Bunhill Fields, of a notorious sectary, named Samuel Eaton, proceeds thus:—

"I could wish that you would certify my Lord [Laud] of this, also that I have been at the Gate-house to visit Mrs. Trask, who has lain in the New Prison, now dissolved, and in the Gate-house, eleven years. She was committed for keeping Saturday for her Sabbath. She would never show any thought of relenting, nor petition, neither suffer others to do so, for her liberty, for that she conceives God, who knows what is best for her, has caused authority to put her into this place. She will not open her mouth against authority, and cannot endure them that do so, but will take them up most sharply. She will receive no gifts, thinking it a curse to beg or borrow. I could never hear that she had any more than 40s. yearly in annuity paid her, and she would never, as I could hear, eat things pleasant to the taste. . . . She has not eaten any flesh these seven years, neither drunk anything but water. She will not go out to take the air, saying it is not for her, and that the keeper has no authority to let her. So she grows aged and melancholy. If his Grace [Laud] think fit, rather than she should lie there to die, I with some others would be bound to bring her in if she should be called for, and so let them turn her out of doors; else she will never go."

The other case (not quite completed in this volume of the Calendar, but narrated by Mr. Hamilton in his preface from his knowledge of all the relevant documents) is that of a stone-mason of Dover, called John Trendall, who had been arrested for illegal preaching, and for divulging such heretical opinions in his preaching as that Christ's ordinances were not in the Church of England, and that "such ministers as have their power from bishops have it by false power." The case seems to have been considered one of great importance, and Laud seems to have made up his mind that it would be well, in the midst of the new hopes which had broken out among the English Puritans and sectaries in consequence of the King's failure against the Scots, to make a severe example of Trendall. Might not even the burning of such a schismatic have a sedative effect? With plenty of imprisonments and other punishments, there had been no actual burning of a heretic in England since 1614, when, by King James's order, or permission to the authorities, two Arians, or Unitarians, Bartholomew Legate and Edward Wightman, had been burnt, the one in Smithfield and the other at Burton-on-Trent. It was resolved to look into this precedent for Trendall's benefit; and, as Neile, who had been Bishop of Lichfield at the time of Wightman's trial, and had been concerned in the proceedings, was still alive, as Archbishop of York, he was applied to for his recollections of that business. Archbishop Neile's reply is contained in two letters, dated respectively August 9 and August 23, 1639. The first of these, by an etiquette in calendaring, does not appear in this volume, being reserved for November 9, the date of a subsequent letter in which it is an enclosure. Here, however, is an extract from it:—

"My blessed master, King James, commanded me to send him [Wightman] down to Lichfield, and myself to go after him, there to proceed against him as a blasphemous heretic. At my coming to Lichfield, being there assisted with sundry divines of very good note, we began with him by divers days' conference, but to no purpose.

Then we proceeded in a legal way against him in the consistory; and, after sundry days passed in a legal manner of proceeding and three assignments for sentence, we appointed a day for sentence, which we executed in the body of the church; and before the sentence denounced, myself began the business with a sermon and confutation of his blasphemies against the Trinity of Persons in the Unity of the Eternal Godhead, the other divines that assisted me each of them confuting one of the points of his blasphemous opinions. To all which he no way relenting but persisting in his blasphemies, I read the sentence against him, and denounced him to be a blasphemous heretic, and to be accordingly certified to the secular power; whereupon his Majesty's writ was directed to the sheriff of the county of the city of Lichfield to burn him as an heretic. Upon the writ he being brought to the stake, and the fire scorched him a little, he cried out that he would recant. The people thereupon ran into the fire and suffered themselves to be scorched to save him. There was then prepared a form of recantation offered to him, which he there read and professed before he was unchained from the stake; hereupon he was carried back to the prison, and after a fortnight or three weeks' time of pausing upon his recantation, he was brought into the consistory, there to declare his recantation and to renounce his said blasphemous heresies in a legal way, that the same might remain *apud acta* in the court, done deliberately upon better resolution and in truth and not upon terror of the fire. When he came into the consistory he blasphemed more audaciously than before. His sacred Majesty, being informed of this his behaviour, commanded the writ for the burning of him to be renewed, which was sent down and executed, and he died blaspheming."

Neile's second letter, which does appear in this volume, is addressed directly to Laud. "The proceedings against Legate at the same time [as those against Wightman] were alike; whose punishments I am persuaded did a great deal of good in this Church," is one of the sentences in this letter from Neile to his brother-archbishop; and he adds, "I fear me the present times do require as like exemplary punishment, which I refer to your grace's grave consideration." After all, as Mr. Hamilton informs us, these interesting inquiries by Laud and the rest of the Privy Council as to the proper preliminaries for roasting heretics came to nothing so far as the Dover stone-mason was concerned. Whether because he submitted, or because Puritan clouds were gathering ahead, he was let off ere long, and disappears from further record.

On the occasion of every new volume of these Calendars, appearing under such editorship as that of Mr. Hamilton and his fellow-labourers, one is glad to observe the progress of a national work adding so largely to our knowledge of English history, and indeed teaching so impressively what real history is.

DAVID MASSON.

Lectures on the Geography of Greece. By the Rev. Henry Fanshawe Tozer. With Map. (London: John Murray, 1874.)

IN the attempt of our own times to gain a vivid conception of the history of past ages, we have perhaps received our most important help from the study of geography. It is a common observation that nothing adds such interest to contemporary history as having seen the places in which great events take place. Those who previously

knew the fighting-ground in Italy or France followed the movements of the late campaigns with the absorbing interest of eye-witnesses. And the help is much greater proportionately when the historical materials are, as in the case of so much of ancient history, comparatively scanty. Ruskin gave expression to the need when he asked, "Which of us knows what the valley of Sparta is like, or the great mountain vase of Arcadia? Which of us, except in mere airy syllabbling of names, knows aught of 'sandy Ladon's lilyed banks, or old Lycaeus, or Cyllene hoar'?" There is, too, all the interest of discovery in such expeditions as that of Leake, when he went out to look for the famous river of Styx, knowing only that it was a tributary of the Crathis, and flowed in a certain district in the north of Arcadia. What must have been his surprise and delight to find a waterfall 500 feet in height, completely justifying the Homeric description. There was the "down-dropping water," "the chill stream of the precipice," which—as during a great part of the year its waters are lost in the snow which lies at its foot, and, owing to its inaccessible position, both its source and its exit are concealed—the Greeks conceived of as a great stream falling down in a sheer cataract to the underworld, and there running with a mighty current to infinite distance. Nor is the interest less when the famous vale of Tempe is reached, and between the lofty rocks of grey limestone, finely tinted with red, the splendid plane-trees become visible which shade the banks of the Peneius along its tranquil reaches; and from among them, here and there, copious streams of clear water are seen gushing out through beds of spreading fern. Once or twice in antiquity we find the expression of the feeling for scenery, as when Livy says:—

"When the traveller, in passing through the rugged districts of Thessaly, where the roads are entangled in the windings of the valleys, arrives at this city, on a sudden an immense level expanse, resembling a vast sea, is outspread before him, in such a manner that the eye cannot easily reach the limit of the plains extended beneath. From this extraordinary spectacle the place is called Thaumaci (Wonderland)."

Compare, too, Livy's curious account (xl. 22) of King Philip's ascending Mount Haemus for the sake of the view.

Mr. Tozer had previously done good service to this cause in his *Researches in the Highlands of Turkey*, which have already become a main source for the editors of modern guide-books to draw their information from; and in this book he has made the varied information collected in the course of several tours available for English students. His object has been—(1) to enable them to form a more real conception of the country; (2) to give a brief summary of the principal physical conditions by which the Greeks were influenced; (3) to sketch the connexion of the geography and the history, starting from the geographical point of view; (4) to point out the connexion of the geography and the mythology, and the etymology of Greek names of places.

Mr. Tozer begins with describing the position of Greece, and he lays especial

stress on its *central* character, so similar in many respects to that of England at the present day, which made her the natural point of communication between the old world and the new; all the arts, all the ideas, all the movements, which passed from the east to the west, must necessarily pass through her. She had it in her power to modify and recast whatever was transmitted from the one to the other, in that comprehensive process of change which transferred all power and culture from Asia, and the countries bordering on the Mediterranean which look towards the East, to the Western lands—the greatest change in the whole course of authentic history. He further notices the way in which the early relations of Greece to Italy were affected by the fact of the two countries standing, as it were, back to back to one another. The outlets of Greece were towards the east, and the soil is far better on the eastern side of Pindus, the backbone of the country, than on the western. Italy, on the other hand, has a completely western aspect, its development depended on the districts of Campania, Latium, and Etruria all opening out on that side; it looks to France and Spain as its natural sphere of conquest—a tendency equally proved by the reversed course of invasion in modern times. Hence the geography of the Aegean waters in the *Iliad* is excellent, but that of the western regions in the *Odyssey* is mere Wonderland, where are the Lotus-eaters and the Cyclops and the island of the witch Circe, and the river of the dead.

In the second lecture the primary features of the country are described—the mountains, coasts, and sea; then follow the secondary—the rivers, springs, lakes, caverns, and gorges. The Greek mountains are excellently described as the most distinctive characteristic of the landscape. Gray was right when he spoke of Greece as a land—

"Where each old poetic mountain
Inspiration breathed around."

"When standing on the summit of Parnassus, which commands the most extensive view in Greece, reaching from Thessaly to Arcadia, and from the entrance of the Corinthian Gulf to the extremity of Attica, most of the great summits are visible, and the effect produced is—not as in looking from Etna over Sicily, where everything is so dwarfed below you as to resemble an outspread map, nor yet, as in some Alpine views, where the attention is absorbed by one overpowering object—but that the eye passes on from point to point, and rests equally on one after another of this federation of mountains."

The connexion of the lakes with the rivers, and the strange subterranean channels through the limestone, meet with due attention; and we are strongly tempted to quote some of the descriptions. Then the physical conditions of the country are described, which, in some respects, are now much changed. The supply of water was once good, and we have ample evidence that Greece was a well-wooded country in ancient times. The trees, shrubs, and plants were so fruitful a source of nomenclature that, even if other confirmation were wanting, we might almost reconstruct the flora of the country from the names of places. The shrinking of the springs and streams was already noticeable in Aristotle's time; but in

the early ages Greece was, like Palestine, "a land of brooks of water, of fountains and depths that spring out of valleys and hills."

The fifth lecture describes the general appearance of the country, and the effect of its conformation on the character and politics of the Greeks; and incidentally a very interesting point is discussed, to which much attention has been drawn by Stanley and others, whether the ancients possessed what we call a taste for the picturesque. Some have even maintained that what they considered a beautiful scene was merely a pleasant place in which you could enjoy yourself. Such a view is absurd, but it is true that the Greek sense of symmetry preserved them from exaggeration in this respect. A correspondence may be traced between Greek scenery and the Hellenic mind in some remarkable instances. The principle of moderation, *μηδὲν ἄγαν*, which formed so marked a constituent in the character of the Greeks, and was the great secret of their taste, is equally inscribed on the face of the country; and even in the mythology, the gigantic and extravagant, which play so large a part in the legends of other countries, are kept almost entirely in the background.

The three next lectures treat in detail of the geography of northern and central Greece, and of the Peloponnese; but we pass over these to come to the most interesting parts of the whole work—on the connexion between the geography and mythology, and on the etymology of Greek names of places. The myths of the Latin races, from the impalpable character of their divinities, were very little identified with places. Milton well expressed the contrast when he spoke of the haunted spring and dale and tangled thickets from which the Greek gods and nymphs were with sighing sent, while the Lars and Lemures moaned on the holy hearths, and the Flamens heard a drear and dying sound in the urns and altars around them. But the Greek heroic myths were entirely local in their grouping. Only on the thirsty soil of Argos could the story of the Danaids have originated, the story of Syrinx and Pan naturally grew up by the Copaic lake because of the reeds which fringe its shores. To the present day the Boeotian peasants tell a story to account for the sudden rise and fall of the lake. But the etymology of Greek names bears still clearer witness to the observation and clear-sightedness of the race. That the Celts should call so many rivers by the mere names which signify "water" or "river"—Ouse, or Usk, or Avon—is not in their favour; the very varied Greek names testify to the intelligence of those who assigned them, and hence we can re-create from them the primitive flora and fauna of the land. Even the wild plants contribute many names: acanthus, fennel, trefoil, sorrel, heather, rush, mint, ivy, poppy, rose—all have given names to their favoured homes. The islands seem more commonly than not to have derived their names in this way. Any one who studies the Homeric catalogue will be struck by the great predominance of this mode of nomenclature, and in Attica at least seventeen of the demes are named from trees and plants.

Many of the names are intelligible at once, and a glance at the locality shows us the reason of them. Erythrae is clearly named from the mass of red trachyte on which its acropolis is built; and Homer's description of "the white summits of Titanus" refers to its chalk cliffs, the very word Titanus meaning chalk. The ancients not unfrequently explain the names by the epithets, as we may see in Virgil's "sulphurea Nar albus aqua" ("Nar" meaning sulphur), "Plemmyrium undosum," "arduus Acragas," "parva Petilia." Not all the names, however, admit of such easy explanations. Some of them contain elements that were lost in the later language, and some may have preserved fragments of the languages of pre-Hellenic tribes. Halicarnassus means "the sea-horn city," but what is the exact force of the termination "assus"? Only as to the name of Athens herself should we venture to differ from Mr. Tozer. "The land of flowers" seems a too daring guess, though Lobeck translates it by *Florentia*; and we agree with the modern peasant, who said to Ulrichs, "they call it Anthena [the flowery], but it has no flowers." But for the fuller discussion of this and many other points of interest we must refer our readers to the book itself, and cannot do more here than refer to such passages as p. 154, the description of Mount Athos, or p. 190, the contrast with the political growth of Italy. It is not fair to pick out all the best passages, but we can assure the reader who takes an interest in ancient times, or would form a vivid idea of the most interesting scenes of ancient story, that he cannot easily find a better guide than the book, of the range of which the title, "Lectures on Geography," hardly gives an adequate idea. C. W. BOASE.

LANGE'S ROMAN ANTIQUITIES.

Römische Alterthümer. Von Ludwig Lange. Bd. I.—III. (Berlin: Weidmannsche Buchhandlung, 1863-1871.)

It is impossible within the limits of a review to do justice to one of the most considerable works in the field of classical study which have appeared in our time. Little more can be done than to sketch its plan in outline, and bring forward a few illustrations of the manner in which the plan has been carried out in detail.

While trusting that his book will have a permanent value for those who study the "Alterthumswissenschaft" for its own sake, Professor Lange does not write mainly for them, but addresses himself to two wider circles of readers. The first consists of those who are specially studying, from a scientific point of view, the Roman language, jurisprudence, or history; while the second comprises those who, without being specially linguists, jurists, or historians, desire to realise the whole ancient life of Rome, as a necessary part of general culture. Where the interests of these two classes of readers clash, Professor Lange regards rather the first than the second. The purpose of the work, it will be seen, excludes so far as is possible the controversial treatment of the subject-matter. At the same time, it was necessary to give, at least in a summary fashion, the chief reasons for accepting one

view rather than another concerning controverted subjects of importance. The author has only felt bound to discuss difficulties in great detail where his own opinion differs from that of the most eminent inquirers who have preceded him. He has, however, made it easy at all points for every reader to test the truth of any view propounded in the text; for in the footnotes abundant references are given to the ancient and modern authorities who have influenced him. In this respect, therefore, the present work is superior to the histories of Mommsen and Curtius, belonging to the same series, which, from the absence of references, appear like splendid structures suspended in mid-air. Still, it is sincerely to be regretted that the plan of the publishers compelled the author to abstain from giving more than mere references. The reader is thus left in doubt which of the passages in ancient authorities quoted to prove any point are important, and which are unimportant. Even a student who closely examines all the passages referred to, may often, without some indications from the author himself, be unable to see the exact processes of comparison and combination by which the opinion maintained has been arrived at. It would have been very serviceable, also, to be told oftener than we are the special value of the numerous modern monographs quoted, which are generally merely catalogued at the bottom of the page. This, however, is the one serious deficiency which appears in the general plan. Before leaving this part of the subject, we must express approval of the historical mode of exposition which Professor Lange has chosen. Instead of severing the national life of the Romans into portions, and writing separate and loosely connected historical disquisitions upon each, as so many of his predecessors have done, he treats the nation as a single living organism, the developments of which he traces from stage to stage so far as is possible. In this respect his work is superior in design to the otherwise excellent *Handbuch der Römischen Alterthümer* of Marquardt and Mommsen, which is really a collection of independent treatises united by a common title.

The portion which Professor Lange has as yet issued comprises the "Staatsalterthümer" down to the end of the Republic. It is not too much to say that his volumes contain the fullest, minutest, and most impartial history of the internal development of Rome that has yet been written. The ancient and modern authorities who can throw light upon the subject have been as nearly as possible exhaustively explored by the author's industry, while his judgment has weighed them all in an even balance. His own keen insight, too, has often enabled him to grasp the truth where the best of his rivals have failed.

The work, then, challenges comparison with the professed Histories of Rome, for it is history in a much higher sense than much of what passes under that name. It is in the highest degree satisfactory to find that our author, in dealing with the earliest days of Rome, has followed the example of constructive criticism set by his illustrious *col-laborateur* Mommsen, rather than the predo-

minantly destructive principles of Rome's most recent systematic historian, Dr. Ihne, of Heidelberg. In their reviews of the earliest history of Rome under the kings and early Republic, both Mommsen and Lange appear at a great advantage when compared with Ihne. The last-named scholar has practically decided that because the kingly period is surrounded by a halo of fable, no history of it is possible. He does not recognise the far-reaching light which the institutions, laws, customs, and civilisation of an historical epoch may cast upon prehistoric times; he is therefore in the position of one who, disbelieving the Mosaic cosmogony, pronounces a science of geology to be impossible. It is only necessary to compare the meagre sixteen pages which comprise the positive results of Dr. Ihne's investigation into the earliest history of Rome (*Hist. of Rome*, book i. ch. 13) with the richly constructive chapters of his two rivals, to be entirely convinced that their conception of history is the far higher one of the two.

Great as Mommsen's first book is, we do not hesitate to say that Lange's treatment of the material is better, except as regards the one merit of vivid language. He brings into stronger relief the principles on whose conflict the evolution of all Roman history depended. His sketch, for instance, of the family organisation, as germ of the State organisation, is more real and true than Mommsen's. In general, our author rivals Mommsen in one of the great master's chief excellences, the art of grouping facts round principles, without forcing the principles on the facts. This is the more to be admired, in that Professor Lange is compelled to deal with vastly more numerous details than are usually handled by professed historians.

A few illustrations, large and small, not confined to the earliest period of the history, may serve to show the conscientiousness with which the results have been worked out. In treating the vexed questions concerning the plebeians and clients, the author has given a contrast based upon a complete survey of all the pertinent facts, which goes far to justify Niebuhr's view of the distinct origin of the two classes. In face of Lange's arguments, Mommsen's summary statement, that "out of the clients arose the plebs," becomes difficult to maintain. If there be any who still believe in Rubino's theory of the theocratic absolutism of the early Roman state, a perusal of the author's account of the relations of the temporal to the spiritual power will probably be sufficient to convert them. Professor Lange rejects the tempting conjecture of Mommsen that the plebeians were admitted to the Curiate Assembly on the expulsion of the kings. In this point we hold him to be right, notwithstanding the inclination to an opposite opinion shown by Professor Seeley in the introduction to his edition of the First Book of Livy. In the course of his two first volumes our author does Mommsen's History a great service, in purging it of many other erroneous conjectures. Among these may be named the supposition that the number of quaestors was doubled in 307 A.U.C., and not in 333; that Appius Claudius, in arranging the classes as censor, did not require landed property as a qualification; that, even be-

fore Appius' time, the libertini were enrolled in the *tribus rusticae*; that the Senate was, before the Lex Ovinia, divided into curiae, and partially so after; that there were two kinds of *concilia plebis*, one held *curiatim*, the other *tributim*, the latter class being created by the Publilian law of Volero; that the much-discussed Valerio-Horatian law, *ut quod tributim plebs jussisset, populum teneret*, refers not to the *plebiscita*, but to the resolutions of the *populus* assembled in the *comitia tributa* under the presidency of a consul.

So entangled is the early history of Rome, that even Professor Lange sometimes loses his way. We have only room to refer to one most unhappy conjecture of his, to the effect that Rome had originally a double line of kings like Sparta. Almost the only evidence he adduces in favour of this is a new interpretation of the word *interregnum*, which he thinks may mean "a changing kingship." But the learned author is always at his weakest when he draws his arguments from etymology. His explanation of *dominus*, as the "seller," from *dare*, to give, defies all the facts of Roman ownership. Take, again, the interpretation of *auctor fieri*—"Ja sagen"—which he adopts from Schömann, a learned scholar indeed, but by no means an etymologist. Occasionally, however, he deals an effective blow at derivations much in vogue, as when he points out that Corssen's view of *Roma* as "stream-town" fails because *Roma* ought to be connected not merely with *Romulus*, but with *Ramnes*, *Remus*, and *Remoria*. Against this objection Corssen makes but a feeble defence in the last edition of his *Aussprache*.

It would be unjust to the author to attempt a short criticism of his elaborate third volume, containing the internal history of Rome from the time of the Gracchi to the end of the Republic. Professor Lange has still to give us an historical exposition of the military and judicial administration; the systematic constitutional history from Augustus to Constantine, with an account of the government of the subject provinces, and of Republican and Imperial finance. The whole work is to conclude with an appendix relating to the period from Constantine to Theodosius. When the work is complete, it will simply be a History of Rome minus the battles and the sieges, the absence of which few will regret. Further, if the rest of the work is worthy of the first three volumes, it will be the best history of Rome in existence—that is, it will present more vividly and more truthfully to the mind the whole historically continuous national life of Rome than any other book. It is to be deplored that the general ignorance of German among our classical students should bar them from access to such stores of knowledge.

JAMES S. REID.

Contes du Roi Gambrinus. Par Charles Deulin. (Paris: E. Dentu.)

SCOTT used to say that when he heard a good story he dressed it up "with a cocked hat and a sword" before he sent it back again into circulation. M. Deulin admits that he has followed Scott's example in his manner

of telling these Flemish popular tales, and he justifies what he has done by quoting a letter of Sainte-Beuve, addressed to him after the publication of his *Contes d'un Buveur de Bière*. M. Sainte-Beuve writes:—

"Vous avez parfaitement fait de mettre du vôtre dans ces légendes et récits populaires: à moins qu'on ne veuille recueillir de simples racines pour la science pure, et pour l'histoire des origines; c'est ainsi qu'il convient de faire, afin de courir de main en main et d'être lu."

It may be doubted whether the process of embellishing is perfectly fair in the case of stories that are now so rare, and are, in a way so ancient, and even sacred, as popular tales. Probably no growth of human imagination is so old as a genuine traditional *Märchen*; before Homer, before the Vedas, they may have been, and they may have charmed the world's youth, as they now charm the children of the world's old age. Whatever theory we may prefer as to their origin and diffusion—and perhaps we should thank M. Deulin for giving us his specimens without any theory—they have still the magical beauty of eternal freshness in immemorial antiquity. Whether these tales, which are found everywhere with such extraordinary resemblances, not only in plot and incident, but even in verbal formulae, were current before the race had divided into the streams which are styled Aryan and Semitic; whether they were first framed in the East, and scattered broadcast by chance merchants and wanderers; whether they are inventions which must necessarily occur to the human mind at a certain stage of its development, they are undoubtedly so old as to deserve to be carefully reported. Nowhere is the science of origins so likely to find valuable facts as in these stories handed down from the conservative class of old women to the still more conservative class of children, who, as every one must have noticed, cannot endure the variation of a word in the stories they know by heart. *Märchen* in these careful hands have survived through many stages of culture, with only such slight changes as the advent of a new religion may beget in popular fancy. St. Peter and St. John "go wandering clad as strangers," as the gods did in the nursery tales of Plato's time. But the saints are very heathenish, and the tellers of *Märchen* repeat stories of cannibalism that would have shocked Pindar or Herodotus. Thus this popular lore is like a plant whose roots are deep in the soil of savage religion, though its boughs bear golden apples from the close of the Happy Islands, and blossoms from within the Paradise of the gentler creed. Besides this their scientific value, popular tales have a curious literary power. They do not weary, though their incidents are ever the same, and their surprises and miracles are always fresh. The most skilful novelist cannot enchant us with their charm, or conceal his plot with their simple art.

Yet we cannot quarrel with M. Deulin for the way in which he displays his collection. If he wishes to be read, and is careless of the science of origins, it is safe to predict that he will gain his end. Neither Dr. Dasent nor Mr. Ralston, in the *Tales from the Norse*, and the *Russian Folk-tales*, has succeeded better as a storyteller. M.

Deulin writes with simplicity and with humour, and probably all that is his own may be found in the reflections his characters make now and then, and in a certain air of romance in the tale of *Désiré d'Amour*—the young prince who did not care for the red and white beauties of Flanders. It would be satisfactory if we could feel quite sure that the end of the tale called *La Dame des Clairs* is really popular. This is the Flemish version of Rapünzel, the story which Grimm thinks Tertullian knew, of the girl whose long yellow hair made a ladder for her lover to climb to her enchanted tower. In the Flemish version here, this lady's dead child appears to her in the night, and enables her to recover her lost husband. Now the pathetic way in which this is related is quite popular in tone, and recalls at once the apparition of the dead mother in the Danish ballad, which is also found in Provence, and which Emily Brontë quotes as current in Yorkshire. But to the best of our memory, this is a solitary instance of the tale of Rapünzel being continued after her happy marriage, when the people praised God—

"For Sebald the king's son
And the lady's golden head."

Another story of much interest is *La Fileuse d'Orties*. Whether popular or not, the story is not older than the middle ages, dealing, as it does, with the cruelty of a wicked seigneur, and the charity of the girl who will not punish the seigneur with death, though that is the only way in which she can keep the affections of her lover. In *Désiré d'Amour* the old plot of the *Goose Girl* and of *Berthe aux Grands Piés* recurs, with curious variations. The bridegroom submits to the change, not because he is under a spell, but because he really believes that the bride has become ugly all of a sudden. "Pauvre fille, se dit-il. Si elle est devenue si laide, ce n'est pas sa faute, c'est la mienne." Here too occurs, almost word for word, a scene found in the Scotch story of *Wich Nocht Nothing*, which is, we believe, unpublished in any collection. There is a still more remarkable coincidence with a myth from the Zulu in Canon Callaway's book. *Le Sac de la Ramée*, again, has affinities with the *Demon Blacksmith* in Mr. Ralston's tales; but whether M. Deulin has touched the story up, or whether the Flemish have nationalised it, it is less shockingly incredible than the *Demon Blacksmith*. The same remark applies to most of the stories; they have a curiously natural and probable air, and might win the faith of the most sceptical child-reader. If this is due to M. Deulin's manner of telling stories, he is greatly to be congratulated; but it is rather uncomfortable to be in doubt what to attribute to the genius of the writer and what to the national character of the people of Flanders. There is much humour in the story of *Le Grand Choleux*, who cheats the Devil and gets into heaven by a ruse. It is difficult, however, to understand the nature of the game of *la crosse*, at which St. Antony is said to be an adept. As far as we can make out, it is something between golf and knurr and spell, with a suspicion of skittles. But this, as Aristotle says, is the subject of a different disquisition. Life at all events was all beer and *la*

crosse for the sturdy Fleming, who caught Death in a chair from which no one could rise without his permission.

The story of *La Viole d'Amour* is rather a fantasy in the manner of Hawthorne or of Gautier than a *Märchen*. And if this book were likely to reach English children, we should be inclined to protest against the grotesque punishment of the wicked sister in *Les Méquennes de Marie-au-Blé*. It is possible, too, that the kind of criticism which made Dr. Dasent expurgate the *Tales from the Norse*, might find fault with an expression here and there in the *Contes du Roi Gambrinus*. But we have to thank M. Deulin for a book which is all delightful, though perhaps it would be more satisfactory to know how much of its charm he conferred on it, and how much is due to the fancy of the people of Cambrai and Avesnes.

A. LANG.

Mildred's Career: a Tale of the Women Suffrage Movement. By Miss Ramsay. (London: Charles Skeet, 1874.) In One Volume.

THERE is an authentic legend of an attached Irish servant who congratulated her mistress on her husband's elevation to the judicial bench in the following happy fashion: "Oh, Ma'am! everybody says that master will make such a good judge, such a *partial* judge, Ma'am!" The idea that a "partial" judge would be the best of judges, and in general that Favour is altogether preferable to Justice, is a notion which lies deep at the root, not only of most Irish grievances, but also of many other evils all the world over; of sundry venerable dogmas in theology; and, above all, of the larger part of the wrongs of women. Nothing is of course more difficult than for the stronger of two persons, races, or sexes, in constant juxtaposition, to hit the middle line, and neither oppress nor favour the weaker, and women must rejoice that, in civilized lands, the balance so often inclines to the side of favour. Still the fact remains, that everywhere they receive either more than justice or less than justice—rarely, if ever, Justice itself. Is it needful to recall to those who talk so eloquently just now against "patronising" the labourer that after all nothing can possibly make up for justice to any rational human being? Much less that indulgence to Mary and Anne is no sort of counterbalance to frightful hardships inflicted on Jane and Elizabeth? Men are on the whole so generous to women, there are so few men who do not daily make some sacrifice for wife, mother, sister, or daughter, and to whom some woman's life is not the most precious thing on earth, that nothing is more startling to them than for the first time to be brought up short with the question, "After all, do women receive justice at the hands of men?" The immediate rejoinder to such a query is usually a laugh of contempt at its obvious extravagance; or else the courteous expression of regret that the speaker—if a woman—should so far have misconstrued the true feelings of men. But a little further investigation of the subject generally ends in shaking the confidence of the respondent in the clear righteousness of

his side of the controversy, and it will go hard, if he be an honest man, but that he will admit that women do suffer, as a class, very grievous injustice in many matters—educational, pecuniary, political and parental—from those who, individually, load them with kindnesses and caresses. To those who retain any doubt about the question, and to those also who wish to read a spirited story, breaking quite fresh ground in the novel-world, we can recommend Miss Ramsay's volume, *Mildred's Career*, very heartily. There is nothing overdrawn about it. It is rather written in a low, pleasant laugh, than "written in a scream." The characters and incidents, though altogether out of the usual line of those of heroines of romance and their adventures, are essentially true to the new phase of female life in England which the authoress has taken for her subject. To those who have had the pleasure of hearing Miss Ramsay lecture, it is needless to add that her book is in perfectly good taste, and contains nothing but sound sense and kindly feeling. If some masculine readers smile at the conclusion of Mildred's "Career" at the inevitable altar of matrimony, let them bear in mind that such a climax is entirely within the programme of the Women Suffragists; their view of the case being that marriage ought not to be accepted on the principle of Hobson's choice, and because a single woman might hitherto have gone about like the frozen-out gardeners, singing "I've got no work to do;" but, on the contrary, that it should be the free option of one who has other interests and perfect independence; and only marries Mr. A because she really loves him, and not for reasons which would have induced her equally readily to marry Mr. B, C, or D. If men only knew how the semblances of affection of which they are so proud often simply mean that a girl's way has been so hedged up with thorns that she rushes at the only outlet opened to her, their satisfaction in their "conquest" would probably be considerably diminished. Emerson says—and it is one of his very wisest utterances—"The great pre-requisite for a noble friendship is the capacity for doing without it and standing alone." Miss Ramsay would add that the same condition is no less needful for a worthy and a happy marriage.

FRANCES POWER COBBE.

LAW BOOKS.

The Election Manual: A Concise Digest of the Law of Parliamentary Elections. By L. P. Brickwood, M.A., and Herbert Croft, M.A., of the Inner Temple, Barristers-at-Law. (London: Virtue, Spalding & Daldy, 1874.) We are indebted to Mr. Gladstone for this book. The authors state as the reason for its publication the premature dissolution of Parliament. They then give us the following rather extraordinary statement that, "since the last general election, the House of Commons has transferred to a legal tribunal a jurisdiction long regarded as one of its most cherished privileges." We were under the impression, which a reference to the Statute Book confirms, that the Act 31 & 32 Vict. c. 125, which is frequently cited in this book, was passed in 1868, and that there had been a general election in the autumn of that year. Most of the decisions cited by the authors are decisions under this Act, and the majority of them cases arising out of the election of 1868! The book contains copious ex-

tracts from the judgments on the different petitions, including the recent Taunton case. These extracts are arranged alphabetically under the various heads of Agency, Bribery, Candidate, &c., and may be found useful by those who have to consult the decided cases, and have not the judgments printed by order of the House of Commons to which to refer.

A Treatise on the Law of Trade-marks. By F. M. Adams, B.A., of the Middle Temple, Barrister-at-Law. (London: George Bell & Sons, 1874.) Mr. Adams has given the public in this book a concise account of what is now a very important branch of our law—trade-marks. It has become so much the fashion for great manufacturers to have a distinguishing mark, that nearly every trader has some sign by which his goods may be recognised, and the contests that are continually arising as to the use of a certain name or device testify the importance the public attach to these trade-marks. In this book the authorities are carefully collected, and Mr. Adams wisely gives points decided without unnecessary comments upon them. They might have been brought down to a later point with advantage, and have been more exhaustively enumerated. For example, we do not find *Raggett v. Findlater*, a recent decision of Vice-Chancellor Malins; nor *Hirst v. Denham*, an important decision of Vice-Chancellor Bacon, as to pirating trade-marks, mentioned in the book. The index is not quite so full as could be desired, but, in spite of these drawbacks, Mr. Adams's book will no doubt prove of use to the public.

Select Titles from the Digest of Justinian is the description of a work undertaken by Mr. Thomas Erskine Holland and Mr. Charles Lancelot Shadwell, the first part of which has just been issued from the Clarendon Press. In these days students of Roman law are expected to know something of the Digest, and the gentlemen above-named aim at making that vast repository of legal wisdom less perplexing to students than since Justinian's time it has been. Their plan is to make a selection from the titles of the Digest, and arrange the selected titles according to their subjects. To each title they prefix a short note descriptive of its contents, but they give absolutely nothing of commentary. Part I. consists of introductory or general matter. The second part is to consist of family law; the third part is to contain the law of property; and the fourth part the law of obligations. A diminution of the matter to be dealt with, and a systematic arrangement of it, will obviously be helpful to the student. But, after all, a considerable mass will remain to be got up by him; and it may be feared that, notwithstanding the interest now shown in the Civil Law, the book will chiefly be useful for reference. We must confess to having little faith in the possibility of studying the Digest with profit without the help of a commentary. But if a selection from it is to be made, we venture to suggest to Mr. Holland and Mr. Shadwell that it may occasionally be well not to give titles in their entirety. The greater part of many titles, which, nevertheless, it may be desirable to quote from, has no relation to modern legal systems or theories. The selections they have made, however, have been made, so far as we can judge, judiciously; and their classification of subjects, if imperfect, is familiar and convenient. The text is that of the edition of the Digest published by Mommsen with the assistance of Krueger (Berlin, 1870).

Gaius and Ulpian. Abdy and Walker. (Cambridge: University Press.) Another work, the appearance of which indicates the growth of interest in the Civil Law, is an edition of the Commentaries of Gaius and Rules of Ulpian, with a translation and notes, by Dr. Abdy and Mr. Bryan Walker. As regards the Gaius, this is a reissue. The former edition was published in 1870, and has been much used and highly valued by students. The addition of the Rules of Ulpian materially increases the usefulness of the

work. In looking through the translation, we have occasionally come upon a passage which in neatness, and even in accuracy, is not all that could be wished. But this is so like saying that the picture would have been better had the artist taken more pains, that we are half disposed to withdraw it; and certainly, on the whole, the work is creditably done. EDITOR.

NOTES AND NEWS.

WE understand that Lord Edmond Fitzmaurice M.P., is selecting for publication, from the muniments of Lansdowne House, letters and papers illustrative of the political life of William, Earl of Shelburne, and first Marquis of Lansdowne, a period ranging between 1761 and 1804. Access to these papers was allowed to Sir G. C. Lewis, when writing his *Administrations of England in the Eighteenth Century*, but much fresh historical matter is still to be gathered from them.

MR. ALEXANDER C. EWALD has in preparation a life of the "Young Pretender" founded upon letters and State papers in the Public Record Office, which have been unknown to previous writers on the Rebellion of '45. For the purposes of this work, too, we may add, Mrs. Erskine Wemyss has kindly lent a valuable family muniment, Lord Elcho's Journal, from 1721 to 1783, the use of which was refused to Sir Walter Scott.

THE Rev. William Campbell, the first volume of whose *Materials for a History of the Reign of Henry VII.* was published in the Rolls Series last year, has made considerable progress with the second volume of this most important contribution to our knowledge of a somewhat obscure period.

WE hear that Mr. Skeat has in the press a new edition of his William's *Vision concerning Piers the Plowman*, for the Clarendon Press series.

THE issue of the first part of the New Shakspeare Society's *Transactions* will be delayed for a few weeks, in order that Mr. Fleay's papers, read last Friday, on the genuine and spurious parts of *Timon* and *Pericles*, may be included in it, with the prints of the genuine portions of each play.

THE extract from Clarke's *Polimanteia*, which mentions "sweet Shakspeare," in 1695, and is the second printed notice we have of him, will be included in the first part of the New Shakspeare Society's *Shakspeare Allusion Books*.

PROFESSOR DOWDEN's lectures on Shakspeare, which have been so popular in Dublin, are to be published by Messrs. H. S. King & Co.

THE second volume of Mr. James Gairdner's edition of *The Paston Letters* will be issued by Mr. Arber next week.

MR. ARBER has nearly finished his new edition of Richard Eden's *Treatyse of the Neve India, with other New Founde Landes and Islands, anvell Eastwarde as Westwarde*, A.D. 1553, the first English book that describes America; and he has printed several sheets of his *Transcript of the Registers of the Stationers' Company*. Into this latter work he is introducing occasional notes.

THE English Dialect Society proposes to publish a new edition of Thomas Tusser's *Five Hundredth Points of good Huswiferie vnted to as many of good Huswiferie* (? 1574 A.D.), with a careful and exhaustive glossary and notes. The book is certainly worth reproducing, and, though it was in Mr. Arber's list for reprinting, we shall prefer an edition of it such as the Dialect Society contemplates. Mr. William Payne, the Treasurer of the New Shakspeare and Philological Societies, will edit the book.

MESSRS. SAMPTON LOW are publishing the Four Gospels, with etchings on steel after the original designs of M. Bida, printed by M. Salmon, with the assistance of MM. Hedouin and Viel Cazal. We have received the first part of the Gospel of St. Matthew, which is to be completed in about

twenty parts, at four shillings each. The part before us contains etchings of our Lord, and St. Matthew writing his Gospel.

AT the Jubilee of the *Jenaische Zeitung*, held at Jena on April 28, facsimiles of the original authorisation of the paper by Weyland Bernhard, Duke of Saxony, dated April 20, 1674, and of the oldest copy of the paper in existence, which bears the date of 1752, were distributed amongst those who took part in the celebration.

A NOTICE has appeared in the *Allgemeine Zeitung* announcing that Dr. Lionel von Donop, of Weimar, who is engaged in writing the life of Buonaventura Genelli, would be grateful for the loan of any letters or documents which might throw light on the biographical history of this eminent artist, or for detailed lists and other particulars in regard to his works.

WE hear that the catalogue of the MSS. of the Würzburg Library, which had been drawn up with extraordinary care and exactitude by the late librarian, Dr. Ruland, is shortly to be printed. The committee appointed to examine and report upon the efficiency and completeness of the work speak in terms of unqualified praise of the learning and industry which have been brought to bear upon it, and characterise it as the most complete catalogue of its kind possessed by any German University.

A CURIOUS old book, whose existence was not even known to German bibliographers, has just passed into the possession of Mr. Carter Brown, of Providence, Rhode Island. It is a Low-German translation of Ruchamer's *Description of the World*, and is entitled *Neue Vnbekanthe Landte*, and was printed by Henning Ghetelen, of Lübeck, and Jürgen Stüchsz, of Nürnberg (1508). It would appear that it was sold last year at Leipzig in the library of the recently deceased Russian book-collector, M. Sobolewski, of Moscow, and was purchased for 500 thalers by an Amsterdam bookseller, who re-sold it to Mr. C. Brown. The fact of a work on such a subject being translated at that period into the Platt-Deutsch dialect affords conclusive evidence of the advanced state of intelligence of the people generally at the beginning of the sixteenth century in Germany.

WHILE Padua is preparing to celebrate the centenary of F. Petrarca in July, and Ferrara that of Ariosto in September next, the little town of Certaldo announces the celebration of the centenary of Boccaccio for next December. This is a pleasing indication not only that Italy remembers her great men, but that the literary movement is spreading more and more through the country.

MR. HALES has issued separately, as a sixpenny class-book, Goldsmith's *Traveller* and *Deserted Village*, with notes, from his "Longer English Poems." He should cut the whole work up into similar sections. The later parts of it, on Byron, Wordsworth, Shelley, are even more wanted than the early ones.

BYRON's popularity appears to be still great in Italy. Two translations of *Childe Harold's Pilgrimage* have appeared at Florence within the last few months, by MM. Carlo Faccioli and Andrea Maffei. Both are well spoken of.

A HITHERTO unknown copy of Chaucer's (or Lydgate's) *Lack of Stedfastness* or *Balade sent to Kyng Richard*, has just been printed by the Hunterian Club, in its Part I. of the Bannatyne MS. 1568. The Scotch copier has introduced a spurious fourth stanza into the poem, and thus altered its Balade form; he has also modified some of its lines. The same part likewise contains Scottified versions of early poems in the Vernon MS. of the fourteenth century, and of the *Dietorie* ("For helthe of Body, cover well thy hede"), and other poems attributed to Lydgate, besides many valuable poems on later manners and customs. In addition to Part I. of the Bannatyne MS.—its most valuable publication as yet—the Hunterian Club has

just issued to its subscribers for 1872-3, two of the satirical pieces of Samuel Rowlands, *Diogines' Lanthorne*, 1607, and *A Fooles Bolt is soone shott*, 1614, with four parts of the Poetical Works of Alexander Craig, a minor Scotch poet of the early part of the seventeenth century, whose works are extremely rare, and have never before been reprinted and collected. These four parts complete Craig's works, and contain his *Poeticall Essayes*, 1604; *Poeticall Recreations*, 1623; *Pilgrime and Heremite*, 1631 (a posthumous work); *Miscellaneous Poems*, with a careful introduction by Dr. D. Laing, giving an account of Craig and his chief poetical contemporaries and friends. The club hopes to issue four more numbers for the two-guinea subscription for 1872-3. Three of the tracts are finished, and the fourth is nearly done, so that the issue will be made in six or eight weeks.

M. LOUIS PARIS is publishing, under the somewhat sensational title of *L'Impôt du Sang*, a reproduction of a MS. destroyed at the burning of the library of the Louvre, which had fortunately been transcribed before its destruction. The MS. was the work of François d'Hozier, the last member but one of the famous family of official genealogists, and under the title of *Les Glorieuses Marques du Militair Français*, it gave the names of all the French officers and persons of quality who fell in battle from the fourteenth to the end of the eighteenth century. It will comprise eight volumes, of which the first has just appeared.

M. PAUL LACROIX has presented to the library of the Arsenal the collection of autograph MSS. of the Abbé Brizard, one of the most learned scholars of the last century. Among the most important of these documents are a History of Louis XI., a Literary History of the reign of Henry IV., a work on the Calendars, the sketch of a History of Henry IV., and some political and genealogical treatises.

DON ADOLFO DE CASTRO who, in 1847, was the perpetrator of a clever hoax in imposing on the literary world a witty book of his own composition as a newly discovered relic of Cervantes, has recently come forward with a work, professing to contain seven new tales by that writer, in regard to whose authenticity his previous conduct does not unfortunately supply any very satisfactory evidence. If Spanish scholars should doubt the genuineness of this edition, by "el excmo. e lln. Señor Don Adolfo de Castro," of the "Varias obras inéditas de Cervantes," &c. (Madrid, 1874), the most high and illustrious señor has only himself to thank for it. His admirable imitation of the style and manner of Cervantes in the spurious *Buscapé*, with which he so nearly succeeded in deluding his countrymen, will necessarily call up no slight degree of scepticism in regard to his present assumed discovery, and it must be left to native critics to decide what amount of faith is to be attached to the seven productions which he now seeks to incorporate with the genuine literary remains of Cervantes. According to the explanation of their discovery, as given by himself, they were found by him among a number of dust-covered manuscripts in the Colombina Library at Seville, and recognised, on evidence which he considers unimpeachable, as the productions of the immortal author of *Don Quixote*. It would appear, however, that only two of these seven pieces can be pronounced strictly new and unknown, the remainder having appeared in one form or another, although never before published as the works of Cervantes. The two hitherto unknown pieces are "Diálogo entre Tillenia y Selenio, sobre la vida del campo," in which two lovers discourse on the charms of a country life; and the "Entremos de los Mirones," which represents the meeting of several students, who relate to a former teacher what are the sights and experiences with which they have become familiar while prosecuting their studies at Seville. Of the satire and fidelity with which the manners of the

times are depicted in these colloquies there can be no doubt, but the question of their claim to be regarded as the productions of Cervantes is not so lightly to be disposed of.

WE learn from the Report of the Birmingham Free Libraries Committee for 1873, just issued, that Birmingham, in addition to its Shakespeare Library, which now contains 5,332 volumes, possesses also, through the munificent gift of a native of Birmingham, a unique Cervantes collection, numbering in all 590 volumes. Among these are editions of *Don Quixote* printed at Lisbon and Valencia, 1605; Brussels, 1607, 1611; Madrid, 1608; Milan, 1610; Barcelona, 1611. The collection also includes Shelton's English version, published in London in 1612, which appears to be the first translation of *Don Quixote*, and many copies of early editions of the minor works of Cervantes, including the first edition of the *Exemplary Novels*, Madrid, 1613, and early editions of *Galatea*, the *Voyage to Parnassus*, and of *Persiles and Sigismunda*, besides 57 volumes on Cervantes and his works in Spanish, Dutch, English, French, Italian, &c.

PROFESSOR LOWELL'S poem on Agassiz in the May number of the *Atlantic Monthly* is in essence a very sympathetic and intelligent magazine article by an accomplished man of letters who has trained himself to write by preference in verse. Of course, such topics as Agassiz' manner of lecturing, though well treated, might have been as well treated in prose; and prose would have saved us from the invocation, first of nature, and then, on better reflection, of the Elizabethan poets, to help the writer to mourn; but such stanzas as this make amends for much:—

"Yea, truly, as the sallowing years
Fall from us faster, like frost-loosened leaves
Pushed by the misty touch of shortening days,
And that unawakened winter nears,
'Tis the void chair our surest guests receives,
'Tis life's long cold that gives the warmest kiss,
'Tis the lost voice comes oftener to one's ears.
We count our rosary by the beads we miss;
To me at least it seemeth so,
An exile in the land once found divine,
While my starved fire burns low,
And homeless winds at the loose casement whine,
Shrill ditties of the snow-roofed Apennine."

It has been thought worth while to publish, under the title of *Esquisse d'un Maître* (Paris: Michel Lévy), the first draught of Chateaubriand's *Mémoires d'outre-Tombe*. He originally meant to have called this work *Mémoires de ma Vie*, and the substitution of the words *d'outre-tombe*, are a specimen of the taste which guided him in his later years. Sainte-Beuve would have been hard to persuade that Chateaubriand left the year of his birth blank in his first copy, through defect of memory. Indeed, one can easily imagine the delight with which the veteran critic would have hailed the certainty that his enemy had written this book, which mainly differs from the actual *mémoires* in the suppression of passages of natural feeling, and the insertion of morbid sentimentalism. Thus in the edition of 1849, Chateaubriand omits the passage of the MS. of 1826, where he praises the supreme courage, honour, and sincerity of his father, and he adds to the statement that he was the youngest of ten children, the reflection, "*j'avais aversion pour la vie.*" Queer words, as well as queer sentiment, disfigure the *Mémoires d'outre-Tombe*, such words as *dochner*, *taillades*, *blandices*. Chateaubriand was touched by the later affectations of the Romanticism he did so much to introduce and render possible. The most pleasing part of the book is the melancholy and affectionate banter of some letters written in 1834-1843, by this *vieux René* to Madame Récamier.

NICCOLO TOMMASO died in Florence a short time since. He was born in Dalmatia in 1803. During a long residence at Venice he was one of the chiefs of the national party, and under the Republic of St. Mark was a member of the Pro-

visional Government. On the capitulation of the city he retired to Corfu, and in 1865 returned to Florence. His best known work is his *Collection of the Popular Songs of Tuscany, Corsica, Dalmatia, and Greece*, but he also turned his attention to history, criticism, and philology, besides publishing some poems which attained no great success. Among his works on these subjects are his *Collection of Papers of Venetian Ambassadors relating to the History of France in the Sixteenth Century*; a Commentary and Studies on Dante; the Letters of Pascal Paoli. During the later years of his life he was afflicted with blindness, but he has been for many years engaged on a great Italian Dictionary.

WE are able this week to furnish our readers with some particulars of the charters which, as we announced in our last issue, have recently been brought to light in Canterbury Cathedral. The whole number of them is said to be about 13,000. Of ancient charters there are nearly 5,000, ranging from the Conquest to the Reformation, the greater portion being of the eleventh and twelfth centuries. These principally relate to the estates of the Church, but with them are a number of miscellaneous papers referring to litigations between the cathedral and other religious foundations, royal privileges, &c. For instance, there are many documents concerning the dispute between Canterbury and York as to the carrying the cross, the quarrel between Christ Church and St. Augustine's, and the detection of forgeries executed by the brethren of the latter house. In addition to the charters which Kemble used, there are some loose ones which had escaped his eye. Amongst other curiosities may be mentioned a grant of land by Swindulf, Bishop of Rochester, A.D. 888, the will of Athelstan Atheling, A.D. 1015, and a confirmation by William I. of an English charter, in which the signatures seem to be autographs. Among the Rolls found is one containing a copy of the ordinances imposed upon Edward II. by the Earl of Lancaster in 1315; another contains documents of the reign of Henry III., viz., the letter of the French king about the barons' war, the letters of the barons and of Henry III. consenting to refer the matter to the French king, the protest of Urban IV. against the provisions of Oxford, Prince Edward's defiance of the barons, dated a day or two before the battle of Lewes, &c., &c. There is also a copy of the indenture between Henry VII., the Abbot of Westminster, and the Prior of Christ Church, for the saying of masses for his family; the binding of this is blue velvet, ornamented with gilt portcullises and roses, and the first page is illuminated. A volume called *The Christ Church Letter Book* contains royal and other letters, some of the fourteenth century, but most of them late in the fifteenth century; many of these are letters from the monks in London to the prior, and accounts of the prior's visits to London. We should add that Mr. J. B. Sheppard, of Canterbury, has been devoting much time to the arrangement and preservation of these archives, and that he will undertake, under the supervision of Canon Robertson, the labour of preparing for the Historical MSS. Commission a report upon the collection of documents belonging to the Dean and Chapter.

A PARIS correspondent of the *Nation* gives some interesting particulars with regard to the second volume of the Catalogue of the MSS. in the National Library:—

"The National Library," the writer says, "possesses a very curious manuscript under this title: 'A Narrative, in the form of a Journal, of what took place in Cologne between the officers of the Queen Marie de Médicis, from the 3rd July, 1642, the day of her death, till the 10th November of the same year.' This manuscript has never been published, and gives some curious details. The officers of the Queen, named Rioland, de Marcé Daguin, and Garnier, as soon as the Queen was dead, made an inventory of all she possessed. The Queen had many debts; she owed money to her own

treasurer, to many merchants. She had pawned, a few days before her death, a silver washstand and a drinking-goblet. Here is a passage from the narrative:—

"A few moments after the death, the said officers being in the room of the said Rioland, some other officers of the household told them that it was very strange that the gowns of the Queen were already disposed of; that as soon as she had breathed her last breath, M^{de}. de Fabroni [Fabroni was the Italian favourite of the Queen] had taken away a golden crucifix which her Majesty clasped in her hands, as well as another crucifix which came from Saint Charles Borromeo, and which Her Majesty held in great reverence. She was also on the point of taking out of the cabinets of the Queen many objects, in order to give them to those who would ask for them. She had divided the watches of the Queen between herself and the maids, as well those which were near the bed as those which were in the cabinets. On seeing which, the said gentlemen, Rioland, de Marcé Daguin, and Garnier, having entered into the rooms of Her Majesty, and having verified the aforesaid, represented to M^{lle}. Silvage that it would be well to keep all that was in the house, especially what was in the room and in the cabinet of which she had the care, in order that nothing should be stolen or lost; that in her quality of first maid, this belonged to her charge. As for the watches and objects which had already been stolen, those who had them should bring them back."

"Fabroni, the favourite of the unfortunate mother of Louis XIII., had already concealed in a drawer four thousand Jacobuses; he had already sent, a few days before, to his brother in Rome a sum of nearly thirty thousand écus. Such was the miserable end of the princess whose triumphal marriage had been painted by Rubens, and who seems, in his magnificent pictures, more a goddess than a queen. Fabroni was on the point of leaving Cologne when the Elector stopped him. Fabroni was in possession of all the papers of the Queen; he alone knew where she had pawned some of her jewels. Marie de Médicis had the finest pearls then known in the world; though she had not mentioned them in her will, it was known that she had destined them for the Queen of France; and she had also intended to give another string, only second in beauty to the first, to the Queen of England. The Elector seems to have behaved well in this difficult matter. He contrived to get the jewels out of the hands of the Jews. He sent a courier to the King of France, and meanwhile he supported the persons belonging to the household of the deceased Queen. On August 10 an order of the King's was sent from Fontainebleau, intimating 'that the gentlemen Rioland, de Marcé, and Garnier should take charge of Her Majesty's house till the arrival of an envoy of the King; that no payment should be made to Fabroni on the goods of her deceased Majesty, no nourishment given to him; and that he should not be allowed to take anything away as a legacy, or under any other pretext.' We read, further on in this note of the King, these lines concerning the most famous diamond in the world: 'As for the big diamond of Her Majesty, called the Saney, sold in Holland, though no mention of it was made in the paper read to the said officers by the secretary, nevertheless Baron von Hüllinchoch has declared that only 70,000 livres had been received from the Dutch merchant, though the diamond was pledged for 75,000 livres, and that the sale was made to satisfy this engagement; on which it was repeated to him that the diamond had been sold without necessity and for the fourth part of its value.'

In no country of Europe is more care being taken of the national archives than in Italy. In accordance with a decree of March 26 of this year a commission, composed of nine members, and under the presidency of the historian, Senator Michele Amari, has been formed to superintend the arrangement and reorganisation of all the provincial archives of the kingdom; to determine upon the best means for their preservation; to decide upon the expediency of their publication, provide for the establishment and maintenance of palaeographic schools in connexion with all the principal collections of archives, and for the training of an efficient staff of upper and lower officials, &c. Considering the treasures which lie buried in the archives of Tuscany, Florence,

Milan, Turin, Parma, Genoa, Venice, and of the numerous other decayed republics and cities of Italy, we may anticipate a rich gleanings of historical knowledge from this harvest of archaeological research.

We are sure that all who are acquainted with the valuable German historical series of Heeren and Ukert, will be glad to hear that the enterprising publishers, Messrs. F. & A. Perthes, of Gotha, have made arrangements with Dr. W. von Giesebrecht, of Munich, to complete the several histories which were left unfinished from the time of their first publication. This series, known as *Europäische Staatengeschichte*, began in 1823, and now comprises seventy-two volumes. Some of the histories, as Dahlmann's *Denmark*, and Lappenberg's and Pauli's *England*, very inadequately fulfil their original design, having been carried in the former case only to the beginning of the sixteenth century, and in the latter not further than our Norman kings; and we shall, therefore, watch with interest the announcement of the names of the writers to whom Dr. von Giesebrecht has confided the labour of completing these two important sections of the general history. It is announced that F. F. Carlsson, of Stockholm, has nearly completed the fifth volume of the *History of Sweden*, begun by Professor Gejer, and that several volumes of other histories are nearly ready for publication.

THE most important portions of the sixth *Report of the Deputy Keeper of the Public Records in Ireland*, which has just been issued, are the account by Sir J. Bernard Burke of the modern State Papers in the Record Tower of Dublin Castle, and the details given by Mr. J. T. Gilbert, of the Irish MSS., of which fac-similes are being prepared at the Ordnance Survey Office, Southampton. We learn that the petitions amongst the State Papers are about 18,000 in number, and afford most valuable historical and genealogical information. The principal subjects of them are connected with the recovery of estates, the reversal of outlawries, rewards for the capture of "Tories, Robbers, and Rapparees," renewal of patents, &c., &c. We were able to anticipate some parts of Mr. Gilbert's report on Irish MSS. in our issues of March 7 and March 14, but the new matter supplied by him is of equal value and interest.

Most writers are agreed that fire-engines, with leathern hose, were first brought into use at the great fire in Southwark, May 26, 1676; but we have referred to many encyclopedias without finding the least mention of any person to whose ingenuity it might be supposed we were indebted for the invention. Such being the case, it is important to notice that among the unprinted State Papers of the reign of Charles II. is preserved a petition which throws considerable light on the subject. This petition is presented by "Theodorus Lattenhöwer Hollander and Dr. in Physick," and sets forth that he had

"invented engines for raising of water in greater quantity, with much more force and facility than any yet extant, and very different from any hitherto invented, and most useful for draining of mines, drowned lands, &c. And that whereas your petitioner hath lately presented one of the said engines to the honourable the Lord Mayor and Court of Aldermen for the use of the city in quenching of fire, and made a plain proof of its great power and effect before them, to their abundant satisfaction, insomuch that they gave your petitioner a gratuity of one hundred pounds, and have bespoke several engines of him."

He therefore prays that letters patent may be granted to him, so that he may have the sole benefit of this invention for fourteen years. The petition appears, from a memorandum at the bottom of it, to have been laid before the Court at Whitehall on August 5, 1675, at which time the Attorney-General and Solicitor-General were directed to report upon it. This report, signed by Sir Fra. Winnington, June 1, 1670, is written

on the same piece of paper as the original petition, and certifies that the—

"new invented engines in the petition mentioned may be of great use in the quenching of fires; and I do find by proof upon oath that the same was very serviceable in the late fire in Southwark, so that by means thereof St. Thomas's Hospital and great part of that parish was saved from the destruction of the fire."

The Solicitor-General further certifies that it will not be in any sort contrary to law to grant the sole benefit of the said engines to the petitioner.

No further reference to Dr. Lattenhöwer, in connexion with this invention, is to be found. It seems probable, however, that he parted with his interest in it to others, for in the *London Gazette*, issued August 14, 1676, appears the following advertisement:—

"Whereas His Majesty hath granted Letters Patents unto Mr. Wharton and Mr. Strole, for a certain new invented Engine, for quenching of fire, with leather pipes, which carries a great quantity and a continual stream of water with an extraordinary force, to the top of any house, into any room, passage or alley, being much more useful than any that hath been hitherto invented, as was attested under the hands of the Masters of St. Thomas's Hospital, and Officers of the same Parish, as in the late great fire at Southwark, to their great benefit and advantage. It being therefore of so public a security and good, this is to give Notice, That they are to be sold at Mr. Rouses, at the sign of the Peacock in St. Martins-lane in the Fields."

AMONG the same State Papers of the year 1676, from which the above-quoted petition is taken, is also an interesting record of a celebrated astronomer. The document is undated, but is addressed "for y^e rth ho^{ble} S^r Jo. Williamson;" it runs thus:—

"Mr. Edmund Halley student of Queens Colledge in Oxford having for some years been a diligent observer of y^e Planetts and starrs, has found it absolute necessary (besides the continuance of observations here) that in some place betwixt the Tropicks where the Sunn & Moone & Planetts will passe near the Zenith without Refraction their motions will much be ascertained and navigation perfected, and that the Island of St Helena wilbe a fitt place, where the Celestial Globe may be finished, the starrs in the Southern Hemisphere being much out of their places."

"He humbly desires his Ma^{ty} letters of Recommendation to y^e Govern^r & Committee of the East India Company, that they will cause the shipp ready to goe to St Helena to transport him & his freind thither and that he may have their orders that there he may be received & entertained & have such assistance as may be fitt for his undertaking."

It was towards the end of this year, the biographers tell us, that Halley, who was but twenty years old at the time, went to St. Helena to make his observations.

THE number of the *Alt-preussische Monatsschrift* for February and March contains a continuation of the sources of Prussian History from 1230 to 1243, by Dr. Perlbach; and an account of the right of the State to amber found on the shore, by Dr. von Brünnick, together with other matter. At a meeting of the Anthropological Society of Danzig, Herr Mannhart read a paper on the tradition that new buildings could not be safely completed without a human sacrifice, usually an innocent child. As late as 1843, he says, at the erection of a railway bridge in Germany, it was popularly believed that human sacrifices had taken place. In Scandinavia, animals were buried when a church was built; and Herr Mannhart argues from the belief that, if this practice were intermitted, the first infant baptised in the church would die, that the burial of the animal had taken the place of the original burial of a child. He says that in removing old ruins bones of men and animals are frequently found, "wie," he says, "u. A. in neuerer Zeit unter der Blackfriarbrücke in London gefundenen Thier- und Menschen Knochen," an illustration which seems to argue a belief in a greater antiquity for Blackfriars Bridge than Londoners are likely to ascribe to it.

FROM the following extract from a letter written by Lord Dorchester in 1630, and printed in Mr. Sainsbury's *Papers relating to Rubens*, it appears that crushes at Court were not altogether unknown in the reign of Charles I. At the public audience of a new Spanish ambassador, "the number of ladies was so great that being divided from the lords, and standing down in file on the Queen's side from the state," i.e. the throne, "to the lower end of the Banqueting House where the ambassador entered, that they reached to the very door, and yet were there many fallings out for spoiling one another's ruffs by being so close ranked."

NOTES OF TRAVEL.

Papers relating to Her Majesty's Colonial Possessions, Part I., 1874.—These papers, which have lately been presented to Parliament, contain valuable information about the population, trade, agriculture, the state of education, crime, &c., of twenty-six of our colonies, the reports being drawn up under the direction of their respective governors. From Jamaica come most gratifying accounts of the great and steady increase of trade during the last seven years, the value of the imports in 1866 being put down at 1,030,796*l.*, while the latest return shows an increase of upwards of 500,000*l.* upon that amount. Several sugar estates were purchased last year by wealthy Cubans, who, abandoning their own distracted island, have settled in Jamaica. One old estate was particularly mentioned to Governor Sir J. P. Grant as having been for some years in a languishing condition; a Cuban gentleman had just purchased it, and sent an order to England for 4,000*l.* worth of new machinery. The skill, industry, and enterprise of these our new fellow-subjects must tell upon their neighbours, and indirectly benefit the whole colony. The cultivation of tobacco according to the Cuban system has also made a satisfactory start, and is fast increasing. It is believed that there is nothing to prevent Jamaica cigars from equalling those exported from Havana. Every effort, at any rate, is being made to attain that standard of perfection: in March, 1870, a prize of 250*l.* was offered for the best tobacco, to be produced in Jamaica by any one cultivator of not less than eight acres, producing 400 lb. of cured tobacco from each acre. This prize was equally divided between two competitors in 1872. The article of bamboo for fibre to be used in the manufacture of paper has quadrupled the export of the previous year, and the same almost may be said of many minor products, such as cocoa, bananas, oranges, pines, limes, lime-juice, and yams. It has lately come to the knowledge of the governor that a noted French firm is about to establish a factory for making the extract of logwood in Jamaica, whereby the freight of thousands of tons of valueless wood-fibre, now needlessly sent across the Atlantic, will be saved; and that an English company is establishing a factory there for making paper from bamboo on the spot. Both enterprises well deserve success.

The reports from Tobago are by no means so satisfactory. The population there is considerably out of proportion to the area of the island, and thus a large area of valuable and fertile land is almost in a primitive state. Large tracts, which in former days were undoubtedly the site of well-worked estates, are covered with forest. A succession of droughts has of late years tended to reduce cultivation considerably, especially in Sandy Point, one of the best districts of Tobago—a level plain of several square miles, once rich and fertile, but now in a worse condition than any other part of the colony. Sugar of course forms the staple of cultivation and export, while yams, sweet potatoes, and most descriptions of tropical vegetables grow in great profusion, and require a minimum of cultivation and labour. Many English vegetables, as peas, cabbages, broccoli, vegetable marrow, &c., thrive well. One of the objections to Tobago, which appears to have taken a tolerably firm hold of the public mind in

the West Indies, is its reputed unhealthiness. Immigrants from Barbadoes, it is often observed, suffer considerably from ague and fever on their first arrival; but they soon recover and become most valuable labourers. As regards the white and native population, Lieut.-Governor Ussher writes, "they appear to present a fair average of health, especially the whites, of whom there are many examples to be quoted at this moment of lengthened residence in this colony without injury to health."

Fine estates are to be purchased there for prices ranging from 2,000*l.* to 6,000*l.*; similar properties in Barbadoes would be worth probably ten times that amount.

At St. Lucia we note an increase in the population of nearly 5,000 souls within the last ten years, a somewhat remarkable fact where the entire number of inhabitants reaches only 31,610. Here, it seems, many of the estates have changed hands lately, and as the new owners are men of means and enterprise, there is good reason to expect great benefits from a new system of management.

"Grenada," reports Lieut.-Governor Freeling, "possesses so many advantages over some of the other islands in being very healthy (exempt from hurricanes and from severe shocks of earthquake), and in having a peaceable and contented peasantry, that it is a matter for grave consideration why its progress is not more rapid—why, when in small or smaller islands, like Nevis, Montserrat, and Dominica, in the Leeward, and St. Vincent and St. Lucia, in the Windward group, capitalists are purchasing land, Grenada should appear to possess no attractions, there being no competition for valuable estates in the market." The reason is to be found, Governor Freeling thinks, in the loose manner in which the government is carried on. The Legislative Assembly, composed of twenty-six members, meets but seldom, and, as a rule, one day's sitting, no matter how important are the measures to be discussed, seems to be considered long enough by many representatives, who then hurry back to their own business. Thus matters of moment and interest have been frequently postponed until forgotten, such as the repair of roads and buildings; and legislation on many and varied subjects has not kept pace with the age.

On April 17 the Egyptian Institute of Cairo held an extraordinary sitting to hear the narrative of the traveller Gerard Rohlfs, returned from the Libyan desert with the caravan of scientific men under his direction. This enterprising expedition, though fruitful in results, did not attain its prescribed end—the oasis of Kufarah, which they desired to visit in order to discover a new route across the desert. The heavens and the soil opposed insuperable obstacles to their progress. They found themselves in front of an interminable chain of sand-hills (dunes) placed transversely, and were beaten back by such murderous blasts as to render it impossible to pursue their intended direction. To persevere in the attempt in the midst of mountains of moving sand would have been inevitable destruction. They lost sixty camels. They then turned towards the north, and, leaving the Great Oasis of Dachel, they passed on to that of Siwah, more to the west.

The various members of the expedition gave a short account of their labours, and two hundred photographs were produced, among which was that of a beautiful Egyptian temple discovered in the oasis of Dachel, with hieroglyphics wonderfully preserved.

The famous Bahr-bela-ma, near Siwah, always believed to be the ancient bed of the Nile, does not exist. To this negative result, which has yet its importance, the expedition arrived. It will, therefore, be erased from the maps.

The remainder of the sitting was occupied by a communication of Professor Panceri relative to his experiments on the action of the poison of the Egyptian serpents, arriving at the conclusion that two animals only, the ichneumon and *Mephitis libyca*, are able to resist the effects of large doses

of the poison of the naja and the ceraste, so that in ordinary cases they may be considered as invulnerable to these serpents. These results may account for the veneration in which the ichneumon was held by the ancient Egyptians.

THE annual meeting of the French Society for the Saving of Life from Shipwreck was held under the presidency of Admiral le Baron la Roncière le Noury, on May 4. The president drew attention to the necessity for enlarging and extending the operations of the Society on account of the great increase of trade. Fortunately, the past winter had not been marked by many violent storms, but the Marine Department and the society had alike felt the importance of providing for greater efficiency in the saving of life. They had been incited to this furthermore by the terrible tragedy of the *Northfleet*, and by the genuine feeling aroused by Mr. Plimsoll's strenuous efforts on behalf of merchant seamen. A bill had been prepared for submission to the National Assembly, but the president showed that such measures would have to be supplemented by extreme watchfulness and care, for without these no amount of legislation could avail. In conclusion, he paid a tribute of praise to the Customs officers on different parts of the coast, who, though not seafaring men, had risked their lives in the noblest manner in numerous cases of shipwreck during the past year.

THAT once popular resort for invalids, St. Helena, has rapidly declined in prosperity of late years, and the latest published report from Governor Vice-Admiral Patey points to no circumstance that in any way indicates an improvement in the depressed condition of the island. From the falling-off of trade, and the diminished means of employment, a large number of the best labourers and artificers have gone away in search of a more remunerative field; 280 have emigrated to the Cape of Good Hope, the greater portion of whom have been engaged for service in the copper mines in Namaqualand. From these causes, from the absence of capital, and from the reduction of the establishments, civil and military, all landed property has become greatly depreciated in value. Rents on an average have fallen about thirty-three per cent. below their former amount. The government lands at Longwood, which have yielded a rental of 313*l.* per annum during the last twenty-one years, could not on the expiration of the lease be re-let for a higher rent than 195*l.*, although repeatedly advertised. The lands at Deadwood, formerly let at 135*l.*, are now let at 60*l.* per annum. Sales of land cannot be effected at all except at a ruinous sacrifice. A property which had twice within the last nine years realised 400*l.* could not be sold last year for a higher sum than 80*l.* Another property costing over 800*l.* sold for 185*l.* Attention has been turned to the cultivation of fibre plants, chiefly the aloe and the New Zealand flax; it is too early yet to determine with what prospects of success. The Governor further remarks after this discouraging statement of affairs:—

"The situation of St. Helena in mid-ocean (sighted by all ships from India, and a very large number from Australia) renders it a most important position for Imperial purposes as a coaling station and dépôt for vessels of war, and it would be highly desirable that it should not be allowed to fall into insignificance, more particularly as in the event of hostilities the sinking of one ship in the Suez Canal (either by accident or design) might effectually close that passage; consequently the situation of this island, in my opinion, is of the highest importance, and not inferior to that of Malta or Gibraltar. Two or three steamers stationed here would intercept the whole of the returning trade of the East."

A COMMERCIAL report from Königsberg comments on the extraordinary alterations which are daily taking place in the Russian dominions; whole countries are being opened up by railways where formerly there were hardly any means of communication. The ultimate result on commerce

it is impossible to estimate at present. All, or nearly all, is still in an embryo state, and any predictions as to which routes or what dimensions trade will eventually take must remain surmises; but when one thinks of the country between the Black Sea at Odessa and the Baltic at Königsberg—Pillau being directly connected by a railway which is now completed, and that likewise St. Petersburg, Moscow, Kieff, Tobolsk, the Crimea, and Sebastopol are within a few days' journey by rail—all of which has been completed without any of the *éclat* which accompanied the opening of the Suez Canal—it is difficult to imagine what results will ensue. One thing at least appears at present to be evident, that this part of the world wishes to extend trade with Great Britain more than seems to be the case in the more southerly and westerly ports of Germany.

THE papers state that the Rev. Charles New, of the Methodist Free Church—whose work, entitled *Life, Wanderings, and Labours in Eastern Africa*, we reviewed two months ago—has just left this country for the scene of his previous labours. After investigating some of the less-known portions of the coast, he proposes to press forward into the interior in the direction of the Nile sources. Mr. New is corresponding member of the Royal Geographical Society and of the British and Foreign Anti-Slavery Society.

THE *Gazzetta Livornese* announces that its fellow-countryman, Captain Fortunato Cassone, just returned from a voyage in the Indo-Chinese Seas, has given to the Institute at Leghorn a valuable collection of plants, shells, and vertebrata. Among the most interesting of the last are his rare specimens of the water-snakes (*Hydrophis*) which inhabit the Indian seas.

CORRESPONDENCE.

ROMAN INSCRIPTIONS IN BRITAIN.

Oxford: May 12, 1874.

I hope you will allow me to make one or two additions to my article of April 18, on "Roman Inscriptions in Britain." Since writing it I have seen reason to suspect the antiquity of the stone at Llanfihangel-y-Traethau, with which I will not trouble you till Professor Hübner has been able to pronounce a final judgment upon it. I ought also to state that there is a list of "vocabula" at the end of his index to the *Inscriptiones Britanniae*, in which *seria* occurs, while *possit* is not very uncommon in provincial inscriptions. The map, moreover, supplies the place of a list of names where inscriptions have been found, and in Professor Hübner's opinion is better than an alphabetical catalogue. I was, therefore, certainly in error in desiring such a list of "vocabula," though I am inclined to think that a catalogue of names might still be a useful addition to the book, besides the map. In quoting no. 1201 I have used the word *trophy* in describing the mass of lead found at the Wokey Hole in Somersetshire. This is the word used by the old writers on the subject, but is, strictly speaking, inaccurate, as the mass in question seems to have had no direct connexion with military operations.

Canon Raine, in a letter I have since received, mentions another inscription recently found at York on a bone tablet at the breast of a skeleton—

DOMINUS VICTOR
VINCIAS FELIX.

Are we to suppose that the man's name was *Victor*, and that the *vincias* is a play upon it, standing for *vivas*, or some such more usual formula? Is it, again, Christian or Mithraic? The same question may be asked respecting the gravestone found at Sea Mills, near Bristol, on which Mr. Searth recently read a paper to the Archaeological Institute, and which he and others think to be Christian. He has been kind enough to send me a drawing of it. On the summit is a ✕, which he takes for an incomplete ✕. Then comes a full-face bust, with ear-rings, and something like an aureola round it, and on the left a leaping dog, on the right a cock. Below are the letters *SPES* | *C* *SENTI*, which seem to contain the name "Spes, wife of Gaius Sentius" (Cp. Dr. McCaul's paper in the December number of the *Archaeological Association Journal*).

Canon Raine in his letter further describes two ivory instruments found in a stone coffin, somewhat of the shape of a boat cut in half—an eight-oar, I presume—about a foot long and highly polished, with a sharp spike at one end and the other part hollowed. I should conjecture, from his description, that one end was used for a fork and the other for a spoon. Can any of your readers throw light upon this point?

I should like to draw attention to the recently discovered *Lex Coloniae Juliae Genetivae*, which is edited by Hübner and Mommsen, in the last number of the *Ephemera Epigraphica*. It is a document of first-rate importance, and appears to be one of those laws, carried by Antony in the first months after the dictator's death, to which Cicero refers (*Philipp.* v. 4, 10). It belongs, of course, to Spain, but may be mentioned here.

I shall, with your permission, send you an account of any other newly-found inscriptions that come to my knowledge, as I think you will agree

with me that the ACADEMY would be doing good service by promoting a wider interest in such things.

JOHN WORDSWORTH.

THE HISSARLIK INSCRIPTIONS DECIPHERED.

Oxford: May 11, 1874.

In my article on Dr. Schliemann's discoveries at Troy (ACADEMY, Jan. 10), I had declared the deciphering of the Hissarlik inscriptions hopeless. They seemed too few in number, too short, too incomplete to admit of anything like a truly scientific treatment. Though I pointed out the similarity of certain letters with Phoenician letters, I carefully guarded against calling either the letters or the language Phoenician. The letters, though in some cases not only similar to, but identical with, Phoenician letters, belong, as I said, to no definite series; and as the modifications of the Phoenician alphabet have a history of their own, no scholar would think of explaining an inscription as consisting at the same time both of ancient and modern varieties. I have been credited both by Dr. Schliemann and by the writer in the *Edinburgh Review* with the interpretation of an inscription as giving the name of *Ἰλιον*; but I should have thought that from the wording of the sentence it was clear that, though I admitted the temptation, I did not yield to the temptation of reading the Hissarlik seal as containing the name of Homer's Ilium.

Dr. Haug (ACADEMY, February 7), tried to decipher some of the inscriptions as written in the Cyprian, others as written in the Phoenician, alphabet, but the results at which he arrived were not considered encouraging. In spite of this, Professor Gomperz, of Vienna, well known to classical scholars in this country, has made a new attempt to use the Cyprian alphabet, as lately discovered by Smith, Birch, and Brandis (see my article in the ACADEMY, March 21), for deciphering the short fragments of inscriptions found by Dr. Schliemann, and, it would seem, with decided success. He has read a paper before the Imperial Academy, of which an abstract appears in the Vienna journals. He reads one inscription (tab. xix. No. 555) as *ἰλας* or *ἰλα*, "Be gracious;" another (tab. exc. No. 3,474) he reads *ἰὺ ἀπαρτοῦ*, which he translates, "I dedicate this to the goddess Apaturos," a name of Athene or Aphrodite; a third, by being read from right to left, yielded the words *ταῦτ' ἐγώ*, "to the divine leader or prince."

One cannot read Professor Gomperz's paper without perceiving that there is method in his decipherment. If I speak still with some diffidence, it is chiefly because I only know the Cyprian letters from the types cast by the Berlin Academy, not from the original Cyprian inscriptions, and can therefore form no definite opinion how far Professor Gomperz is justified in admitting varieties of each letter. Of course, with such scanty material, some room is left for accident, but the reading of the last inscription, in particular, inspires confidence. And what startling results would flow from this discovery! Among antiquities found at Hissarlik at a depth of seven metres below the surface, and therefore classed as pre-historic or pre-Hellenic, or non-Hellenic, we find the Cyprian alphabet and the Greek language! This will show that the objections which I raised at the meeting of the Society of Antiquaries (ACADEMY, May 2) against the names of pre-Hellenic or non-Hellenic, assigned to the Hissarlik antiquities by Mr. Newton, were well founded. The Cyprian alphabet (see ACADEMY, March 21), is of cuneiform origin, and so imperfect, as compared with the Phoenician letters, that as soon as the Phoenician letters became known, it had to vanish. It may, therefore, be taken for granted that the Hissarlik antiquities, containing the inscriptions, represent a period of Asiatic Greek civilisation anterior to the arrival of the Phoenicians, or, at all events, of the Phoenician letters, in Asia Minor. And yet the language is Greek—real, historical Greek. Here are the first

elements for forming a conception of a real, as distinct from a Homeric Troy, though the name is, as yet, a simple assumption. Hitherto no scholar could have ventured to speak of a real Troy, except to express his profound ignorance of it. We only knew the Homeric Troy, Troy as conceived by Homer, with its arts, and its religion, and its language as reflected in the mind of a Greek poet. Beyond this we knew as little of a real as distinct from a Homeric Troy, as we know of a real as distinct from a Homeric Hades. Now we may say for the first time, supposing that Professor Gomperz is right, that at a period previous to the introduction of the Cadmean letters, Greek was spoken on the Skamandros, and a civilisation which had reached the culminating point of the art of writing, at least for monumental purposes, had struck root on the spurs of Mount Ida. MAX MÜLLER.

THE WORD "ROSE."

Clapham : May 12, 1874.

Permit me to add a few words to the discussion on the origin of the word "rose." Not only Aryan and Semitic, but, as Professor Max Müller says, "even Hamitic scholars" have something to say upon the subject.

An important question, to which justice has not yet been done, is whether the Coptic $\sigma\alpha\mu\pi\tau$ is a genuine Egyptian word, or one of the many Arabic words introduced into the Coptic vocabulary by the Mohammedan conquest. One portion of this question can now be answered with absolute certainty. The word existed in the Egyptian language two thousand years before the Mohammedan conquest. The older form

$\sigma\alpha\mu\pi\tau$, *uarta*, is to be found as early as the fourth Anastasi papyrus (page 12, line 2) written in the time of Seti II.; and the document in which it occurs is still older, for a considerable fragment of it is found in the first Sallier papyrus, and is probably of the time of the great Rameses, more than 1,300 years before the Christian aera. That *uarta* is the real original of $\sigma\alpha\mu\pi\tau$ is, I think, quite certain; but I am bound to say that there is as yet no positive evidence of its botanical identity with our rose. It was, however, a definite flower, the object of songs sung to the accompaniment of musical instruments in drinking parties. It is by no means unlikely that the discovery of a picture of the flower itself, with its name written over it, may one day enable us to identify it with certainty. The meanings of a vast number of Egyptian words have been identified in this way.

There still remains the question whether the ancient *uarta* is a native Egyptian or a borrowed word, and if the latter, whence borrowed. The form of the word leads me, I confess, to consider it as an Aramaean importation. There is at least nothing to be said against this hypothesis. There are very few (if any) foreign words in the Egyptian texts anterior to the eighteenth dynasty, but from the beginning of this period intercourse with Asiatic countries, and the importation of foreign merchandise and words, was constantly on the increase. Many of these foreign words end in *ta*, corresponding, not, as Egyptologists have commonly supposed, to the final Hebrew *at*, *it*, or *ot*, but to the Aramaic ܐܬܐ . The very passage of the fourth Anastasi papyrus which speaks of the *uarta* speaks of the *Kendaur* as a musical instrument, which M. Chabas with great probability identifies with ܕܐܘܪܐ , a word, however, by no means confined to one form or to the Hebrew section of the Semitic family.

Whether it be possible or no to trace the history of the word *uarta* further back than I have done is very doubtful. The original form of the word may be Accadian for aught we know. If it

be a Semitic word its root is lost, but there would be nothing surprising in this. Our knowledge of the Semitic vocabulary is extremely limited. The Hebrew lexicons, for instance, give us probably as untrue a notion of the extent of the ancient Hebrew vocabulary as the Coptic lexicons do of the ancient Egyptian language. We have now actually recovered from the monuments and papyri as many thousand Egyptian words as Peyron's lexicon contains hundreds.

Anyhow, I cannot see any sufficient reason for going to the Persian language for the name of the rose. There is nothing more notorious in the history of Persian than the enormous extent to which it has borrowed from Semitic sources, particularly from Arabic. Dr. Wright is certainly unassailable as to his statements, first that the Persians have borrowed the common Arabic word *ward* for the rose; and secondly, that *vartā*, in the Pehlevi-Pazend glossary, seems to be nothing but the Aramaic *vardā*.

The probability of a connexion with the Zend *vareda* would undoubtedly add great weight to any positive historical evidence of a Persian origin, but in the absence of such evidence little importance can be attached to it. I could as easily find an Egyptian derivation for $\rho\acute{o}\sigma\alpha\nu$ in the very common word *rut*, which as a verb signifies "to grow," and as a substantive "that which grows" "what is grown," etc. In Coptic it appears under the stems *rôt* and *rôt*. The passage from the *t* to a *d* is no difficulty, for the *d* in *Mendes* and all other Hellenised Egyptian names corresponds to a *t* in the original. P. LE PAGE RENOUF.

SWISS ALLMENDS.

Oxford: May 13, 1874.

In my notice of Mr. Barham Zincke's *Swiss Allmends*, published in your columns last week, I used the following words: "Of the etymology of the word Mr. Zincke does not so much as give a hint." This statement is not strictly accurate, for on p. 297 Mr. Zincke says: "Allmend means land which is held and used, as the word itself indicates, in common." I am very sorry I overlooked this passage, and shall be much obliged if you will allow this correction to appear in your next issue. JAMES R. THURSPFIELD.

EVE AND THE RIB.

In a recent number of the ACADEMY (April 18), mention was made of a solution proposed by Dr. Kleinert to the problem, why Eve should be said to have been formed from a rib. The "solution" was this:—

"The primitive Semitic language possessed a word 'hav. rib. It is preserved in the Arabic dual form *al-havānī*, which can no more be referred to a trilateral root than *yadānī*, the two hands. The word was lost in Hebrew, but, before it was lost, the name of the mother of all living, 'Havvā, had been mixed up with 'hav, the old word for rib, so that nothing was more natural than that Eve should be said, not only to be 'bone of my bone,' but the very rib, or 'hav, of Adam."

It will be observed that the whole theory hangs upon one single nail, the Arabic "dual" form *al-havānī*, or, as it is better written, *el-havānī*. Unfortunately, Dr. Kleinert's knowledge of Arabic does not appear to be quite equal to the occasion. In the first place, *el-havānī* (or, without the definitive, *havānīn*) is not a dual form, but the plural of *hānīyetun*. In the next place, it can and must be referred to a trilateral root, *hnw* or *hny*. Lastly, even supposing that some Arabic scholar should agree with Dr. Kleinert in contending that the root of *el-havānī* is biliteral, it must yet be remembered that these two radicals would be *hn*, not *hw*; and thus the *w* or *v*, which is essential to Dr. Kleinert's theory, is cut away by his own supposition of a biliteral root. The root *hny* means "bend," and *el-havānī* (= "the benders") is the name for the longest ribs.

STANLEY LANE POOLE.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

- SATURDAY, May 16, 1 p.m. Sale at Christie's of the remaining portion of the Collection of Drawings and Pictures of the late R. Ellison, Esq.
2 p.m. Operatic Concert (Floral Hall).
3 p.m. New Philharmonic Concert (Madame Essipoff's First Appearance (St. James's Hall)).
" Crystal Palace: Fête in Honour of the Czar. Grand Concert.
- MONDAY, May 18, 1 p.m. Sale at Christie's of the Modern Pictures and Water Colours of the late J. Farnworth, Esq.
" Sale at Sotheby's of the Library and MSS. of the late Sir W. Tite.
3 p.m. Asiatic Anniversary.
" Herr Paner's third Historical Piano Recital (Hanover Square Rooms).
8 p.m. British Architects.
" Fourth Philharmonic Concert (St. James's Hall).
" Society of Arts: Professor Barff on "Carbon and Certain Compounds of Carbon." (V.I.)
- TUESDAY, May 19, 3 p.m. Royal Institution: Professor Rutherford on "The Nervous System."
7.45 p.m. Statistical: Dr. Millar on "Statistics of Death by Suicide among British Troops;" Mr. J. Bidolph Martin on "The Elections of 1868 and 1874."
8 p.m. Pathological.
" Anthropological: Mr. E. R. Hodges and the President on "Notes on a Phœnician Inscription alleged to exist in Brazil;" Mr. E. Croghan on "The Celtic Element in the Lycian Inscriptions;" Miss Emma Wallington on "The Physical and Intellectual Capacities of Woman equal to those of Man;" Mr. E. Staniland Wake on "Cannibalism."
8.30 p.m. Zoological.
9 p.m. Civil Engineers: The President's Annual Conversation.
- WEDNESDAY, May 20, 11 a.m. Pharmaceutical: Anniversary.
12 Society of Arts: Special Meeting on Public Museums and Galleries.
1 p.m. Sale at Christie's of the Collection of Old Worcester Porcelain of Percy Robins, Esq.
" Sale at Christie's of the Paintings, Engravings, and Painters' Etchings of the late John Pre.
" Sale at Sotheby's of the Hugh Howard Collection of Coins and Medals.
2.30 p.m. Grand Opera Concert (St. James's Hall).
7 p.m. Meteorological.
8 p.m. Society of Arts: Captain H. W. Tyler on "Simplicity as the Essential Element of Safety and Efficiency in the Working of Railways."
" New Philharmonic Concert (St. James's Hall).
- THURSDAY, May 21, 3 p.m. Royal Institution: Professor Story Muskelyne on "Physical Symmetry in Crystals."
4 p.m. Zoological.
6 p.m. Philosophical Club.
7 p.m. Numismatic.
8 p.m. Chemical: Dr. Corfield on "The Sewage Question from a Chemical point of view."
8.30 p.m. Antiquaries.
" Royal: Mr. H. N. Mosley on "The Structure and Development of *Peripatus Capensis*;" Mr. J. Imray on "The Uniform Wave of Oscillation—an Analysis;" Professor Tyndall on "Some further Experiments on the Transmission of Sound;" Mr. W. Spottiswoode on "Combinations of Colour by Polarised Light."
- FRIDAY, May 22, 3 p.m. Hallé's Third Recital (St. James's Hall).
4 p.m. Botanic.
8 p.m. New Shakspeare Society: Mr. J. W. Hales on "King Lear as a Type of the Kelt."
" Quætt Club.
" Society of Arts: Mr. W. Weldon on "The Manufacture of Chlorine."
8.30 p.m. Clinical.
9 p.m. Royal Institution: Professor W. K. Clifford on "The Education of the People."

SCIENCE.

La Chaine Traditionnelle: Contes et Légendes au point de vue Mythique. Par Hyacinthe Husson. (Paris, 1874.)

To look for fragments of ancient mythology in modern folk-lore is like looking for Sanskrit or Greek in English or French. We now and then meet with a modern word which seems hardly to have suffered at all from the wear and tear of centuries, and looks as fresh and sharp as if it had just been issued from the mint; but such cases are rare, and frequently they are deceptive. *Lolling* may be the Sanskrit *lāl*, *roi* is the Sanskrit *rāja*, *daughter* is the Sanskrit *duhitār*; but *to call* is certainly not *καλεῖν*, nor can *Wodan* be identified with *Bud-dha*, or *Paradise* with the Sanskrit *Paradesa*. Then come all the doubts as to whether what we find so strangely like in English and Sanskrit comes direct from the primeval Aryan inheritance, or whether it was borrowed at a later time by one heir from the other. *Sugar* sounds very much like Sanskrit *sarkara*, grit, pebbles; it is in fact the same word; but the Sanskrit *sarkara* passed through Persian and Arabic before it reached Europe, where it appears as *σάκχαρον*, *saccharum*, *zucchero*, granulated sugar. In English the word has reached the very point from which it started, for cabmen now speak of the sharp stones on newly macadamised roads as *sugar*, Sanskrit *sarkara*.

There is but one safe path to follow in these researches into the origin of words or stories. We must trace the modern words back to their most ancient forms in their own language, and the modern stories back to their most ancient version in their own country, before we attempt any comparison. Without this process all combinations are guesswork, sometimes very attractive and almost irresistible, but always dangerous, and never of really scientific value.

M. Husson, in a small volume just published, called *La Chaine Traditionnelle*, has selected some well-known popular stories, and has pointed out in them fragments of ancient mythology, such as we find in the Vedas and elsewhere. His analysis is always clever and ingenious, but the conviction which it carries must greatly depend on the disposition of the readers. It may be or it may not be, is what many will say after reading his book, though few will put it down without feeling that some of the coincidences discovered by the author are very strange and very startling.

He begins with the story of Little Red Riding-Hood, and he points out that, like her, the Dawn in the Veda is represented as a young maiden, as carrying messages, as bringing food, as travelling along to join the old Dawn, and as intercepted and swallowed by the Wolf, whether as the representative of the sun, or of the night. All this is true, and might be supported by ample evidence. Even the fact that the dawn was rescued from the mouth of the wolf may be matched by the German story which represents Rothkäppchen as cut out of the wolf's stomach. But in spite of all this, it would be a bold assertion to say that the story of Red Riding-Hood was really a metamorphosis of an ancient story

of the rosy-fingered Eos or the Vedic Ushas with her red horses, and that the two ends, Ushas and Rothkäppchen, are really held together by an unbroken traditional chain.

Everything is changed as soon as, in addition to the coincidences in characteristic events, we have the evidence of language. Names are stubborn things, and those who imagine they can dispute away their evidence by joking on Mr. John Bright as a solar hero, forget that in ancient times, to say nothing of mythological periods, names were not what they are with us, inherited, accidental, and meaningless, but that they were real *cognomina*, given with a purpose, which purpose it is for us to discover. We read, for instance, in the Veda that the being swallowed by the wolf is called Vārtikā. Now Vārtikā has a meaning; it means a quail, the returning bird. But as a being delivered by the Asvins, the representatives of Day and Night, Vārtikā can only be the returning dawn, delivered from the mouth of the wolf, i.e. the dark night, or, in a different application, the returning year, *Vertumnus*, delivered from the prison of the winter. The Greek word for quail is the same, it is *ὄρνις*; and when we read that Apollo and Artemis, the children of Latona, the night, were born in Ortygia, which is an old name of Delos, we see that there is here a real traditional chain between Vārtikā, the Dawn, and Ortygia, the Dawn-land; we feel we have arrived at a living mythological germ, which was afterwards developed independently in Greece and India.

M. Husson's identification of Cendrillon and Sodewa-Bai with the Dawn that "stands tiptoe on the misty mountain tops" is again very ingenious, but will it convince the unbelievers who see nothing but human elements in all these stories, and shake their head at everything short of the positive proof afforded by identity of name? M. Husson has himself, with reference to Mr. Fergusson's work, *Tree and Serpent Worship*, pointed out *qu'il y a serpent et serpent*, that the serpent occurs in different parts of the world as a symbol of various and totally independent conceptions. Sometimes the serpent represents darkness and evil, sometimes he is the Agathodaemon, the *genius loci*, sometimes he is the symbol of an autochthonous race. In one myth the serpent represents the sun, in another lightning and the thunderbolt, in another the serpents are meant for serpentine rivers. In India, as in Europe, serpents are the guardians of treasures; though poisonous, they are supposed to possess the art of healing, the gift of wisdom, the power of prophecy. The serpent with seven heads exists in India and Babylon, in the steppes of Russia, and in the ruins of Cambodia. There is an Aryan, there is a Semitic, there is a Turanian, there is an African Serpent; and who but an evolutionist, would dare to say that all these conceptions came from one and the same original source, that they are all held together by one traditional chain?

But although we doubt whether M. Husson will convert those who do not like to be converted, his book can hardly fail to make them feel a little uneasy.

M. Husson is very successful in unrayelling

one of the stories found in the *Contes de ma Mère l'Oie*, published by Perrault, and there called *La Belle au Bois*. It is the world-wide story of the maiden who receives a wound, falls into a deep sleep, and can only be delivered by a truly solar hero. Perrault, who wrote in 1697, knew nothing as yet of solar theories, yet in the simplicity of his heart he tells us that the children born of the marriage between *La Belle au Bois* and the young prince who called her back to life, were called *L'Aurore* and *Le Jour*, while in a Breton story (Luzel, *Rapport*, p. 8) *La Belle au Bois* herself goes by the name of *La Princesse Tournesol*. Another strange coincidence is that *La Belle au Bois* has a little dog, called *Poufle*. In a Norse story, the heroine who pines away in the kitchen, sitting on the ashes (Cendrillon), has a little dog called *Flo*. She says to him: "Run along, little dog Flo, and see whether it will soon be day!" This is repeated three times; and at the very moment when the dog looked out for the third time, the dawn began to rise. It is impossible to read this, as M. Husson points out, without thinking of the well-known Vedic story of *Saramā*, the dog of Indra, and most likely a name of the morning (*Lectures on the Science of Language*, vol. ii. p. 506).

There are many comparisons of the same character in M. Husson's book, all of them very ingenious and suggestive, but few supported by strong and irresistible evidence. In his comparisons of names, M. Husson is less successful; and such comparisons as *Ahriman* and the Vedic *Aryaman*, or the tree *Ash* in Egyptian, and the Teutonic *Ask* will certainly be quoted against him and against the system of mythological interpretation which he follows. Nothing but the strictest adherence to the rules of comparative philology can lead to solid results in comparative mythology, and silence the objections of those who still think that there is nothing irrational in mythology that requires explanation.

MAX MÜLLER.

Is the Third Evangelist the Author of the Book of the Acts? [*Is de derde Evangelist de schrijver van het Boek der Handelingen?*] By J. H. Scholten. (Leiden, 1873.)

READERS of Scholten will remember the surprise—I might almost say the shock—with which they received the elaborate attempt made in his *Paulinisch Evangelie** to show that "The Book of Acts is not intended to approximate Paul and Peter to each other, and so to remove the opposition between the Jewish-Christian and the Pauline parties; but, on the contrary, to glorify Christian universalism and the apostolate of Paul, and demonstrate its superiority to that of the twelve. The tendency of the book, therefore, is precisely the same as that of the third Gospel."†

It is true that if the Acts and the third Gospel are, as is almost universally admitted, the work of a single author, and if the third Gospel is distinctly Pauline, the Acts must be Pauline too; but that such a critical must should enable a man like Scholten to resist the clearest evidence of facts was not encouraging to those who hoped for any sub-

* Pp. 428-467.

† P. 467.

stantial result from the labours of modern criticism.

The work announced at the head of this article, therefore, is more than ordinarily welcome; for it is to be regarded, apparently, as a sort of supplement or corrective to the "Pauline Gospel," rather than an instalment of a critical work on the Acts, and in it the author definitively withdraws from the untenable position he took up in 1870.

The question, "Is the third Evangelist the writer of the Book of Acts?" is now answered in the negative, and a careful comparison is made between the teachings of the third Gospel and the Acts, on—1, the apostolate of the twelve; 2, Jewish-Christianity and Paulinism; 3, the Jewish Law; 4, the doctrine of repentance, good works, and faith; 5, justification; 6, the person of Christ; 7, the Cross and the resurrection of Jesus; 8, the doctrine of redemption; 9, the resurrection of the dead. The result of this comparison is to establish the marked Paulinism of the third Gospel and the irenic tendency of the Acts upon each one of these points.

The passages which have been relied upon as establishing by their contents the identity of authorship of the two works are next examined, and shown to be favourable to the hypothesis of a not slavish imitation on the part of the author of Acts rather than to that of the identity of authorship.

The next section treats of the passages in the third Gospel which seem to have a conciliatory or anti-Pauline tendency (e.g. Luke i. 5—ii. 52; iii. 23, *ὡς ἐροῦντες*; vii. 3—5; xvi. 17; xxii. 28—30, &c. &c.), many of which had already been rejected as glosses in the 'Pauline Gospel.' A careful examination of these passages yields the curious result that the close similarity of style between the third Gospel and the Acts (which has been so much relied upon as proving the identity of authorship) is far more striking in these passages than in the rest of the Gospel. This discovery paves the way to Scholten's conclusion, which is as follows:—The author of the Acts, who wished his book to be looked upon as a continuation of the third Gospel, not only carried out his own work in a conciliatory spirit, but re-edited the third Gospel (which was a Pauline polemic, while his own work was a Pauline apology), with interpolations and glosses intended to bring it more into harmony with the general spirit of the Church in his day. The proto-Luke, therefore, stood between the ultra-Pauline-polemic redaction of Marcion and the irenic-apologetic redaction of the author of the Acts.

A short concluding section shows that this view of the relation between the Gospel of Luke and the Book of Acts is quite in harmony with external evidences, direct and indirect.

In an appendix, lastly, Scholten notices an article in Hilgenfeld's *Zeitschrift* for 1873, 4th Heft (which did not come under his notice until his own pamphlet was already printed), in which Wittichen comes to substantially the same conclusions with regard to a later redaction of the third Gospel by the author of Acts.

PHILIP H. WICKSTEED.

THE ACADEMY OF SCIENCES AT WASHINGTON.

Washington: April 27, 1874.

In the month of March, 1863, the Government of the United States, though cumbered at that time with the perplexities and trials of a gigantic intestine war, took thought for the establishment of a "National Academy of Sciences." The constituent members of the Academy, fifty in number, were named in the original act of incorporation, but it was provided that the body, in the subsequent stages of its life and activity, should be self-perpetuating by the choice of its surviving members in the filling up of vacancies. It was implied in the theory of such a body that it should be composed of men distinguished for original research in some one or another of the sciences; and, in point of fact, the greater part of its labours have been distributed between its two main working sections: Class A, Mathematics and Physics; and Class B, the Department of Natural History.

The Academy is obliged, by the terms of its charter, to hold an annual meeting at Washington in the closing part of the month of April, but is not prevented from holding intermediate sessions at other times and at other places as may suit the convenience of its members. Others than the active and regular members of the body are also freely admitted to share in its discussions; and for this purpose the President of the Academy is empowered to invite as many persons not connected with it to attend its meetings as he may think proper, and each member has the privilege of inviting a number not to exceed five. Gentlemen thus invited are permitted not only to attend the meetings—which, indeed, are open to the public—but also to participate in discussion, and to submit papers for the consideration of the society. The president of the Academy is the venerable Professor Joseph Henry, the secretary of the Smithsonian Institution.

At the annual session of the Academy, held on April 21, 22, and 23, the following papers were read:—

"On the Classification of the Rhynchoptherous Coleoptera." By Dr. John L. Le Conte.

"On Combinations of Mechanism for the Imitation of Mental Processes." By Professor Fairman Rogers.

"On the Functions and Mechanism of Audition." By Professor A. M. Mayer.

"On the Duration of the Sensation of Sound." By the same.

"On the Reflection of Sound from Flames and Heated Gases." By the same.

"On the pretended Localisation of the Mental and Sensorial Functions of the Human Brain." By Dr. Brown-Séquard.

"On the Transit of Venus." By Professor Simon Newcomb.

"On the Cañon System of Colorado, and the Mythology of the Resident Indian Tribes." By Major J. W. Powell.

"On the Geographical Results of the last Arctic Exploration under Captain Hall." By Dr. Bessels.

"On certain Phenomena presented by the Satellites of Jupiter." By Professor Stephen Alexander.

"On the Meteorological Results deducible from the Weather Maps of the U.S. Signal Bureau." By Professor E. Loomis.

"On the Contractual Hypothesis of the Earth's Surface Changes." By Captain Dutton, of the U.S. Army; and

"On a New Set of Co-efficients, in the Place of Bernouilli's Numbers." By Professor J. D. Warner.

Among these papers I may, perhaps, signalise those of Dr. Brown-Séquard, of Professor Newcomb, of Major Powell, and of Professor Loomis, as most likely to possess some interest for your readers. Dr. Brown-Séquard disputes most emphatically all the attempts that have been made by physiologists in Germany, France, and England, to

localise the special functions of the brain in sensation, perception, and ideation, including under this latter term the faculty of expressing ideas by speech. He contested especially some recent statements made under one or another of these heads by Dr. Ferrier, of Guy's Hospital, and by Dr. Carpenter, of London.

Professor Newcomb, of the U.S. National Observatory, gave a detailed statement of the measures taken under the auspices of the U.S. Government for observing the transit of Venus in December next. These measures were initiated four years ago, and have now been matured. With regard to the stations selected he spoke substantially as follows:—"The only satisfactory station in the southern hemisphere in respect to weather was found to be Hobart Town, in Tasmania. New Zealand is nearly as favourable. But from all the other proposed Southern stations the accounts were very bad; notably at the proposed station at Hurd's Islands the almost uniform report was 'clouds, rain, tempests, and snow;' the chances of observation there did not exceed two-tenths; this station was therefore given up. The most favourable station left at the South was Kerguelen Island, though somewhat neighbouring to Hurd's Islands, and that was selected. A party will also be landed, if practicable, at Croisette. Instead of sending four parties to each hemisphere, we shall send three to the north and five to the south, to equalise the chances as to weather."

"It is hoped to get complete results from at least two parties in each hemisphere. The constitution of each party is such that in case of disability on the part of its chief, the second officer can take his place. Each party will have three photographers—a chief photographer, who must have been of long experience in the business; an assistant that has had practice, and a second assistant trained only for the occasion."

The paper of Major Powell contained an interesting contribution to the science of anthropology, and of comparative mythology and philology, as illustrated by the habits, myths, and languages of the Indian tribes inhabiting Colorado in the western territory of the United States. Perhaps the body of their mythology is most interesting, as serving to show their outlook on the world. They have no conception of an all-wise, all-powerful, or omnipresent Being. They have no worship, except that of animals, the origin of which Major Powell explains on this wise: "The Indian's food, clothing, and most valuable ornaments come from these animals, and his greatest skill was employed in their capture. He studied carefully their habits and watched closely all their movements, and doubtless became more familiar with them than with any other objects or phenomena of nature. He witnessed their wonderful instinctive skill, and saw that for which his simple philosophy gave no account. The power, too, of these animals was a source of wonderment. The badger lived in mysterious underground compartments; the squirrel made his home in the trees, and could pass from branch to branch and from tree to tree with a celerity which he could not understand; the lizard made its way over the face of the rocks and cliffs with an ease and swiftness that he could not comprehend; then he saw the serpent, swift, without legs; the rapid darting of the trout in the waters; the glorious soaring of the eagle in the heavens; the art of the spider to make his snare, and all the wonderful feats of the hosts of animals with which he could never vie, and which he could not explain, and from admiration he grew into adoration, and these animals became his gods.

"Then, another principle or sentiment, which seems to exist almost universally in the minds of men, appears to exert a modifying influence on his mythological beliefs. The men of to-day are never esteemed as the men of yesterday; we can see their weakness, their foibles, their faults, and their sins. Only the men of yesterday or yesterday's yesterday are great men; the perspective haze of time covers all that was unlovely.

"If this sentiment prevails with civilised nations, it is entertained to a much greater extent by savage people.

"Everywhere they bitterly mourn the degeneracy of the present times, and speak with pride of their fathers and grandfathers. And this same mental characteristic is observed in the deification of animals. The wolf of to-day is a howling pest, but the wolf of yesterday is a god.

"In addition to animal gods, the sun and moon are recognised as deities, and they have gone but a step or two beyond this in creating for themselves purely imaginary gods."

The paper of Professor Loomis, of Yale College, was an essay towards the scientific reduction of the weather maps published daily by the Signal Bureau at Washington. The reduction is made from the observations of the last two years, and treats at some length of the general direction, rate of movement, and area of the storms that have swept across different parts of the wide extent of the United States during that period. The extent of territory covered by these observations makes them exceedingly valuable for the purposes of scientific generalisation, and the paper of Professor Loomis received the special commendation of Professor Henry.

P.S.—Among the papers read before the Academy, but which I had not the opportunity of hearing, there should be mentioned the following in addition to those above designated:—

"On the Tides of Tahiti." By Professor W. Ferrel.

"On the Laws of Cyclones." By the same.

"On Metamerism in Inorganic Chemistry." By Professor Wolcott Gibbs, of Harvard College.

"On the Comparative Velocity of Light in Air and in a Vacuum." By Professor Stephen Alexander. And "On the Results of Scientific Explorations in the Western Territories." By Professor Hayden.

Special importance was attached to the papers of Professor Gibbs and Professor Alexander. The latter remarked that in accordance with the undulatory theory the velocity of light must be less in atmospheric air than *in vacuo*, in the inverse ratio of the index of refraction of atmospheric air to 1; that is, as 1 to 1.000294. The velocity then as ascertained by experiment under the air should be increased by just about 0.000294 of itself to be equal to that *in vacuo*; i. e. to the extent, almost exactly, of 55 miles per second; a very small quantity indeed in comparison with the whole velocity of 185,000 miles per second; and yet, small as it is—and so small as to be below the limits of error of the experiments in question—it is yet very closely equal to three times the velocity of the earth in its orbit.

It is an outstanding excess, and no more, with which we often have to do, as, for example, in the measurement of temperature; but the scale on which those differences sometimes present themselves makes them, small as they may be in their original comparison, grand in comparison with ordinary standards. Professor Alexander was not aware that anything has yet been put forward elsewhere on this subject.

JAMES B. WELLING.

NOTES AND NEWS.

A SCIENTIFIC balloon ascent was made by MM. Crocé-Spinelli and Sivel, on March 22, from the neighbourhood of Paris, and though the height attained was nothing like that reached by Messrs. Glaisher and Coxwell, being only about 25,000 feet, yet some interesting results appear to have been obtained. One of the chief objects of the ascent was to determine, by means of the spectro-scope, whether aqueous vapour exists on the sun or not. In the solar spectrum, as seen on the surface of the earth, there are two bands, one on each side of the sodium lines, due to the absorption of the vapour of water, which Secchi considers are

caused by water on the sun, while Janssen holds that they arise from the action of our own atmosphere, and that they would disappear if the observer could rise above the vaporous part of the earth's atmosphere. M. Crocé-Spinelli's observations support M. Janssen's view of the question, neither band being seen at the height of about 20,000 feet.

In this ascent, the aeronauts took with them bags of oxygen diluted with common air, which they found very useful in counteracting the effects of rarefaction of the air. On inspiring the oxygen M. Crocé-Spinelli found that he was able to eat with a good appetite, and to attend to his observations, notwithstanding the great altitude and the extreme cold, which was -7° Fahrenheit (39° below freezing). Owing to the motion through the air in the descent, which was very rapid, the observers felt the cold much more than at the highest point, though the temperature had risen to $+20^{\circ}$ Fahrenheit.

THE Russian astronomer, M. Struve, who has come over to this country to make the final arrangements for the Transit of Venus in concert with Sir George Airy, communicated to the Astronomical Society, at their last meeting, a paper on the companion to Procyon, discovered by himself last year. Procyon, like Sirius, is distinguished by having an irregular proper motion, by virtue of which it appears to describe an elliptic orbit about a central body, which, till M. Struve's discovery, had escaped detection. In an elaborate paper, Auwers showed that M. Struve's faint, but not necessarily small, star would satisfy the conditions required for the disturbing body, though the evidence of its being the missing member of the twin system was not conclusive; he pointed out, however, that if it were the *vera causa*, it would change its direction with reference to Procyon by some 9° , and Struve now finds that it has actually done this, so that this interesting point appears now to be settled satisfactorily. Strange to say, this companion has not been seen with any of the monster telescopes of this country or America, but Mr. Talmage stated at the meeting that he had measured its position with Mr. Barclay's telescope of nine inches aperture, at Leyton. The brightness of the principal star is so overpowering that special contrivances are required to hide its light, and, as M. Struve pointed out, no amount of aperture in the instrument employed will make up for neglect of these precautions. Assuming a parallax of a quarter of a second of arc for Procyon, corresponding to a distance which light would take thirteen years to traverse, it would appear from Auwers' investigation that Procyon must have a mass about eighty times that of our Sun, whilst its apparently minute companion would have one of seven times; but it should be remembered that the data on which these conclusions are founded are somewhat uncertain, and that considerable corrections may be required.

MR. BRETT, the well-known artist, has, from a consideration of the shadows cast by certain oval-shaped white markings on Jupiter, given reason to conclude that we do not see the true body of the planet, but only a semi-transparent stratum of vapour or liquid. In connexion with this idea, we must remember that Jupiter is, on the whole, very little more dense than water, so that there seems a strong *a priori* probability that a considerable portion of its visible diameter is composed of vapour.

WE learn from the *Débats* that P. Secchi has found the comet recently discovered by Tempel to be similar in its constitution to other comets which have been examined since the spectro-scope was first directed to these bodies in 1866. It appears that they all consist of carbon, probably in the form of a hydrocarbon, as their spectra closely resemble that of olefiant gas; but our knowledge of the causes which give rise to the various forms of carbon spectra is not yet complete, and we are hardly yet in a position to determine the

peculiar state of the carbon which forms these strange bodies. The close connexion between comets and meteors, and the fact, fairly well established, that a meteor stream seen at a distance presents all the appearance of a comet, only render the solution of the problem the more difficult.

PROFESSOR A. W. WRIGHT, of Yale College, U.S.A., has contributed an interesting paper on the Zodiacal light to the *American Journal of Science*. The results he arrived at are that the Zodiacal light is polarised to the extent of 15 or 20 per cent. in a plane passing through the Sun, and that, consequently, the light is derived from the Sun and reflected from solid matter, this matter consisting of small bodies (meteoroids) revolving about the Sun in orbits crowded together towards the ecliptic. These conclusions are supported by experiments made on light reflected from various kinds of rock (including a portion of a meteorite), which gave, on the average, a polarisation of about 15 or 20 per cent.

M. HORNSTEIN, the Director of the Prague observatory, professes to have discovered a connexion between the magnitude of the daily changes of magnetic intensity and the Sun spot period, and from the figures given by him some relation would appear to exist between the two phenomena; but before accepting any such conclusion as established, a much more complete investigation is required. The years compared are only those of maxima and minima for the most part, and accidental causes may easily have affected some of the years selected. Besides, it does not appear that the daily observations were frequent enough or sufficiently free from systematic sources of error, such as the neighbourhood of iron, to give us any very great confidence in the result. A short time ago M. Hornstein, from the observations of a single year, deduced a connexion between the earth's magnetism and the rotation of the Sun; but the Astronomer Royal pointed out that, though the Greenwich observations for that particular year countenanced this conclusion, yet those of preceding and following years completely negated it, and that the apparent connexion was really the result of pure accident. The doctrine of chances teaches us that we must, in a long series of observations, expect such runs of luck just as in games of hazard.

CONSIDERABLE damage is reported to have been done to the vines and fruit trees in the Rhine and Moselle districts by the rapid and violent change of temperature with which the whole of central and northern Europe was visited at the close of last, and the beginning of the present month. It has for some time been a recognised fact that a wave of cold passes over Europe about the first ten days in May, but this year its coming was slightly in advance of its usual appearance, and the damage inflicted by the sudden transition from the summer heat of the previous week to a temperature which fell below the freezing point would have been far greater had the cold not been accompanied by an exceptional degree of dryness. In the duchy of Baden the prospects of injury to the vines seemed so imminent, that a meeting was convened, on May-day, at Offenburg, of all interested in the cultivation of the vine, when it was resolved to light fires in all the vineyards of the district, and endeavour, by means of the fumes and smoke thus engendered, to ward off the effects of frost, and it is asserted that this novel expedient was found to have been pre-eminently successful in its effects. In the neighbourhood of Mayence, where no such precautions were taken, it is estimated that 25 per cent. of the promised crop of grapes has been irretrievably blighted; and in some parts of Hungary the damage sustained is so great as to have been officially adduced as a satisfactory plea for the remission of a part of the ordinary taxes. In Württemberg the rising sun, on the mornings of April 30 and May 1, was observed to be surrounded by a peculiar halo, circumscribed by radiating and

prismatic bands, which stretched far across the horizon, and were identical in appearance with the rings described by Mariotte, and referred by him to the refraction of light in the ice crystals present in the surrounding atmosphere.

The movement of the glacial wave coincident with the beginning of May is pointing eastward, and while the Black Sea has been visited by hurricanes of wind, accompanied by excessive cold, snow has fallen at Salonica, and Bagdad has been visited by tempestuous weather and a rising of the Tigris, which has overflowed its banks, bringing destruction to property, and entailing a serious loss of life.

At a meeting of Convocation of the University of London, held on Tuesday last, a motion "That, in the opinion of Convocation, it is desirable that women should be permitted to take degrees in the University of London," was carried, after an adjourned debate, by a majority of 83 against 65. The decision will, however, carry with it no practical results. All applications to the Crown for a new Charter must originate with the Senate of the University, Convocation having merely a power of veto.

At the same meeting, a motion urging the Senate not to permit, under any circumstances, except for medical or curative purposes, the practice of vivisection to be carried on in the physiological laboratory at the Brown Institution (for the treatment of the diseases of animals), was lost by a majority of 59 against 16.

The subject proposed by the trustees of the Johnson Memorial Prize at Oxford for the next essay is "The Present State of our Knowledge of the Physical Constitution and Probable Origin of Comets." Papers must be sent in to the Vice-Chancellor on or before March 31, 1875.

The preparations for the coming transit of Venus have drawn particular attention to the eminent astronomer, Jeremiah Horrocks, who was the first to observe a transit of Venus. It is now proposed to place a memorial of him in Westminster Abbey or elsewhere.

A DISCOVERY was made a few weeks since at Bonn, of two distinct strata of buried human remains, superposed on one another. The upper stratum is believed to contain the *débris* of a burial-ground of the middle ages, while far below this was found a layer of human bones, which from the fragments of pottery and the coins and other objects mingled with them, is conjectured to belong to the period of the Roman occupation of that part of Germany. With the exception of some coins of the Roman empire, few of the objects found were perfect; but notwithstanding their shattered condition, it was easy to distinguish between the two periods to which they respectively belonged. This discovery is the more remarkable, because in 1865, when the Hospital-gasse was widened, which is some distance from the Gudenauergasse—the scene of the recent excavations—a great number of Roman and Frankish graves were brought to light, the former being, as in the present case, far below the latter. At that time an immense number of cinerary urns were discovered, in which were found, mingled with calcined bones, numerous coins, and terra-cotta and glass vessels of various forms; but these were, unfortunately, for the most part destroyed or abstracted by the workmen. The upper strata contained such an enormous accumulation of human bones, that it was not unreasonably conjectured to have been a public burial-ground, which, as was further assumed from the character of the glazed earthenware vessels intermingled with these remains, belonged to the later Frankish, or early middle ages.

THE Society of Arts has awarded the Albert gold medal for the present year to C. W. Siemens, D.C.L., F.R.S., "For his researches in connexion with the laws of heat, and the practical application of them to furnaces used in the arts; and for his improvements in the manufacture of iron; and

generally for the services rendered by him in connexion with economisation of fuel in its various applications to manufactures and the arts."

WE see that Professor Max Müller has been elected an honorary member by the Académie Royale des Sciences at Amsterdam, and by the Philological Society of Liverpool.

SIR RUTHERFORD ALCOCK has resigned the Presidency of the Turanian section of the International Congress of Orientalists, and his place has been supplied by Sir Walter Elliot.

THE following remarks on Dr. Fergusson's new edition of *Tree and Serpent Worship* appear in the *Hindu Patriot* of March 16, 1874:—

"A good many of the inaccuracies and unwarrantable conjectures which disfigured the first edition have been removed, and on the whole the work is greatly improved. We regret to note, however, the unfairness and tone of hauteur which the learned author has assumed with reference to his brother archaeologists. Adverting to certain remarks of General Cunningham on the age of the Amaravati Tope, he says, 'I would hardly care to notice his opinion on this subject.' This we cannot help thinking is flippancy in *excelsis* against an officer and gentleman who is unquestionably the highest living authority on the subject of Indian archaeology. Were it otherwise, still the general's age and standing in society, his vast erudition, his extensive knowledge of Indian history and antiquities, and his manifold discoveries in Indian archaeology, should have secured for him a more courteous treatment than what is implied by such a sneer, and from a person who has done little in the way of original research into Indian archaeology, for it should be borne in mind that his works, popular as they are, are remarkable more for the pictures of Indian architecture not generally known in Europe, and as illustrations of the power of the camera lucida and the artistic excellence of Anglo-Indian photographers, than as new contributions to our knowledge of the subjects. Had the General's claim to consideration been much less, and had his various essays and dissertations not been near so worthy of regard as Mr. Fergusson's books, instead of being, as they unquestionably are, greatly superior, still the etiquette of literary discussion would have required a more deferential tone than what Mr. Fergusson has thought proper to adopt."

THE Portuguese papers are highly incensed. M. Renan had been proposed as a corresponding member of the Royal Academy of Portugal. He was supported by the President of the Section of Moral and Political Sciences, M. Teixeira de Vasconcellos, by M. Augusto Soromenho, Silva Tullio, Vicomte de Castilho, and Pinheiro Chagas; but a clerical opposition was organised, and the result was the rejection of M. Renan. It is a good sign that this act of the Royal Academy should have excited so much national indignation in Portugal. Academies are meant to represent science and art, and must be influenced in their elections by scientific considerations only. If men like Darwin, Huxley, Carlyle, or Mill were excluded from the F.R.S. or the D.C.L. on account of their theological opinions, these titles would soon sink to a very low point in the scale of scientific honours. We quote the following passage from the speech of the President, M. Teixeira de Vasconcellos:—

"I am a Catholic and shall die faithful to this holy and true religion. But it is repugnant to me to mix profane and sacred matters, and to appreciate the author of *L'Histoire générale des Langues Sémitiques* by another book which has not been presented, and which, though it may be condemned by Catholics, and contain grave errors, ought not in this case to have become the basis of appreciation. The Academy has a right to decide in literary and scientific questions; it is not called upon to correct religious opinions, and ought not to determine the competence of an author in linguistic science by the purity of his Catholic faith."

These are noble words coming from Lisbon. We hear that M. Renan will be immediately elected a corresponding member by another section of the Portuguese Academy, that of Mathematics and Natural Science.

THE most important discoveries that have been made of late on the soil of ancient Etruria are no doubt those of Chevalier Antonio Zannoni. His excavations, carried on during four years at the Certosa, near Bologna, the site of the ancient Felsina, have brought to light more than 400 tombs, the contents of which, exhibited in the Municipal Museum, have attracted the attention of antiquarians and ethnologists all over Europe. Chevalier Zannoni is going to publish a full description of his discoveries, consisting of two parts. The first will give the fullest description of all the tombs and their contents; the second will explain the results obtained with regard to the ancient history and civilisation of Etruria. The two parts will consist of about 300 pages in royal folio, with at least 150 pictures, partly in woodcuts, partly in lithographs and chromolithographs. The work will be published in about twenty-five fasciculi, the price of each being ten lire. Subscribers' names are received by the association of Gli Scavi della Certosa di Bologna, and by the principal foreign booksellers. The publication is strongly recommended by Professor Corssen as a work "*magna cura et rei peritia praeeparatum atque elaboratum*."

MR. A. H. SAYCE has in the press a volume on the *Principles of Comparative Philology*. Several new theories will be advanced; but the work will mainly consist of a criticism of current philological views and assumptions.

CURTIS'S *Studies on Greek and Latin Grammar*, vol. vi. pt. 2, contains as usual some very interesting articles. Fritzsche writes on Greek Reduplication, and Meyer continues his researches into the composition of nouns in the same language. Wörner decides that the Homeric *ἀνέπαια* is used adverbially, in the sense of "up to the roof-window;" Mangold considers the original meaning of *ἔθνος* to be "allotted land" (from *da*, "divide"), thus throwing a light upon the social and political life of the early Hellenes; and the editor contributes some valuable papers on *ἔξω*, *ἐκτός*, *ἐξωτός*, *ἐξωτός*, and the accusative forms of the Latin personal pronouns which end in *d* (*med, ted, sed*). He shows that the latter have nothing to do with the old ablatives, but represent independent accusatives taken, like *μήτε* or *coram*, from stems or bases still found in Sanskrit. It is highly probable that the Greek accusatives (*μήτε, σί, ἔ, ἄμπε, &c.*) have lost a final dental. *ἀνέπαια* originally signified "that which imitates a man," and *ἐξωτός*, as Bugge has already pointed out, comes from the possessive *sewa* (*se*), like *ἐξωτός* and *ἐξωτός*, the termination being the same as that which meets us in *αὐτο-ἰδιος, ὁμο-ἰδιος, or κο-ἰδιος*.

THE last number of *Hermes* (vol. viii. part 3) begins with conjectural emendations by Haupt of various Latin and Greek writers, mostly late. Hertz follows with a study of the style and language of Ammianus Marcellinus, more particularly in so far as he is an imitator of Aulus Gellius; and Rose has two interesting articles: one on shorthand writing in the twelfth century, as exemplified in a work on that subject by John of Tilbury, a monk of Henry II.'s reign; and the other on the School of Toledo—the centre of Arabic and Jewish learning and science in the twelfth and thirteenth centuries, where John of Morley in Norfolk listened to the lectures of Gerard of Cremona, and other eminent teachers, on Ptolemy and Aristotle. Hirschfeld contributes two Greek inscriptions, found at Athens last year, which belonged to a chapel of "the hero physician;" and Wölfflin concludes with remarks on the MSS. of Livy.

DR. BÜHLER, who has been commissioned by the Indian Government to make a survey of the manuscripts which are still preserved in public and private libraries, and to whom we owe already most valuable information published in the Catalogue of MSS. from Gujarat, has lately been exploring Rajputana. He started in December for Jessalmir and Bikanir, towns celebrated for their

libraries. In the great library of the Jains at Jesalmir, Dr. Bühler found a complete set of their classical works, written between 1104 and 1440 A.D., all in beautiful condition, on palm leaves, not scratched, as is generally the case with South Indian MSS., but written with ink. He also discovered two historical poems, one by Bilhana, which contains notices of the life of its author and of his patron, one Vikramāditya of Kalyānakataka (1068–1127), the contemporary of Bhoja of Dhāra and of Harshadeva of Kashmir. In Bikanir the Raja possesses a splendid collection, rich in Vedic MSS., particularly for the Atharva and Yagurveda. From Bikanir, Dr. Bühler went to the Punjab, visiting the sacred rivers celebrated in the Rigveda, the Satadru (Hesydru, Sutlej), the Irāvati (Hydraotes, Ravi), and the Vipāsā (Hyphasis, Bejah). He then proceeded to Lahore, Delhi, Agra, Prayāga, and Benares, and back by Calcutta to Bombay. The report of this journey promises to be full of interest, and the Government deserves the highest credit for supporting Dr. Bühler's literary researches. He prepares at the present moment two new works for the press, the *Sriharshakarita*, and the *Desābhasamgraha*, which contain 10,547 Prakrit words, most of them hitherto unknown.

THE *Novo Mundo* of April 23 publishes a facsimile of the Phœnician inscription which excited so much attention last year. It was said to have been found on a stone near Parayba, in Brazil, by a certain Sr. Costa. It contains an account of Canaanite Sidonians who, during the reign of King Hiram, started from Aziongaber, sailed to Africa, and were wrecked on the coast of Brazil. The director of the National Museum of Brazil, Dr. Ladislau Netto, states that he has never been able to see the original, and the copy of the inscription, though cleverly executed, is now admitted to be apocryphal.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY (Monday, May 4).

SIR SIDNEY SMITH SAUNDERS, C.M.G., in the Chair.—The Entomological Society of the Netherlands presented a well-executed medal, struck in honour of M. S. C. Snellen von Vollenhoven, on his retirement from the office of President, which he had held for twenty years.

G. T. Porritt, Esq., of Huddersfield (hitherto a subscriber), and Herbert Goss, Esq., of Brighton, were balloted for and elected members of the Society.

Mr. Butler exhibited an example of arrested development in a Peacock butterfly, caused by the tail of the pupa having become detached during the process of emerging; the right wings being completely developed, whilst those on the left side were not developed at all; the pupa case remaining attached to the left side of the body of the butterfly.

Mr. W. C. Boyd exhibited specimens of *Solenobia inconspicua*, taken in St. Leonard's Forest, and amongst them a specimen of a remarkably pale colour, which might possibly be an albino variety—but it had a very different appearance from the ordinary form.

Mr. Boyd also exhibited some leaves of the common cunefrey (*Symphytum officinale*), gathered at Cheshunt, the under sides of which were found to be completely covered with specimens of *Brachycentrus subnubilus*. There appeared to be some hundreds of specimens closely packed together, and they were all dead, or in a moribund state, when found. All were said to be males, but on close examination a single female specimen was discovered among them. No explanation could be given as to the object of their congregating together. Mr. Stainton remarked, that there were many such instances of a habit of congregating amongst insects, which were equally unaccountable, and, as an instance, he mentioned a fact known to all breeders of *Micro-lepidoptera* respecting the pupation of the greater number of

the *Nepticulæ*, the larvae of which live solitary as leaf-miners; but if a number of leaves containing larvae are collected and put together in a box, it is found that the cocoons are constructed gregariously between certain leaves, without any apparent reason for the preference.

Mr. C. O. Waterhouse read a note by Dr. Lamprey, Surgeon-major, 67th Regiment, on the habits of a boring beetle, one of the *Bostri-chidae*, found in British Burmah. It belonged to the genus *Sinoxylon*. Dr. Lamprey did not know the name of the tree on which it was found, but he described the insect as making a small hole in a stem that was about half an inch in diameter, and by devouring the wood completely round, it severed it with a clean cut, so that it was only kept together by the thin outer layer of the bark, the first gust of wind snapping off the weakened branch. The beetle turned on its side while boring, its back being towards the bark, and in this way its form appeared to suit the circumference of the stem. Two small portions of the severed stem were exhibited, together with a specimen of the beetle.

Part II. of the *Transactions* for 1874 was on the table.

SOCIETY OF BIBLICAL ARCHAEOLOGY (Tuesday, May 5).

DR. BIRCH, F.S.A., President, in the Chair. The following papers were read:—1. "Synchronous History of Assyria and Judah, B.C. 745–688." By J. W. Bosanquet, F.R.A.S., Treasurer.—This was a paper in sequence to a previous one by the learned author (*Trans. S. B. A.* ii. p. 147), in which he lowered the dates of the Jewish kings by twenty-five years, a view supported in the present paper by an examination of the published Cuneiform documents, B.C. 745–688; so that the assumed uncorrupted Hebrew text was proved to corroborate this displacement. The grounds upon which Mr. Bosanquet based his argument were as follows: (1) Menahem (reigned in Samaria ten years) became tributary to Tiglath-Pileser in this king's eighth year (B.C. 738), *Cuneif. Insc.*, though the common reckoning makes Menahem to have died twenty-four years before (this is rectified by substituting Pekah). (2) Some Assyriologists assert that the Assyrian scribes omitted thirty to forty archons, to suit their respective theories. (3) Isaiah makes Sennacherib invest Jerusalem in 14 Hezek. (713 B.C. Old Reckoning); and the Assyrian Canon makes the accession of the former 705 B.C. (rectified by changing 14 to 28 Hezek.). (4) Jotham's reign doubled over Uzziah and Ahaz is rejected by them *in toto* to suit their system. (5) Mr. G. Smith (*Trans. S. B. A.* ii. p. 324) allows ten years lower in the death of Pekah (729 v. 739 B.C.); but Mr. Bosanquet believed that 716 was the true date. (6) B.C. 738, New Reckoning, is 49 Azariah, and Sennacherib third campaign Jerusalem, B.C. 701, or 2 Hezek. (see Chron. ch. 29–32 for coincidences confirmed by Annals of Sennacherib and five monumental authorities, as well as the Bible, Josephus, Herodotus, &c.). (7) Syrian tribute list of three Tiglath-Pileser, eighth year's list, where Pekah displaces Menahem in Samaria. (8) Solemn religious rites, B.C. 787–727–667, celebrated every sixty years apart, new Babylonian Cycles or *Kharu*; wherein Mr. Bosanquet investigated the cycle change from Belus B.C. 2286, confirmed by Genesis xi., written 1500 B.C., and revised 500 B.C. by Ezra and his associates. (9) Assyrian tribute list gives Yuhukazi, formerly supposed to be Ahaz, but shown to be Uziah=Kazi-yahu. (10) In 718 occurred Pekah's spoliation of Judah: Tiglath Pileser, Shalmen., and Sargon coeval rulers in 717 (2 Kings xxviii. 16; Isaiah ix. 10; x. 8). (11) The dates occurring upon some old Crimean gravestones indicating that Samaria fell B.C. 705–696 (Smith, 720); Hezekiah became ill B.C. 689 (Smith, 712); former agrees with eclipse as calculated by Sir G. Airy and Mr. Hind from modern astronomical data. Compare the author's *Messiah the Prince*,

and other writings. This interesting paper was illustrated by six plates.

2. "Revised Translation of the Descent of Ishtar, with a further Commentary." By H. Fox Talbot, F.R.S., &c.—In this paper the learned Assyriologist showed that the Legend of the Descent of Ishtar was, in its present form, dramatically arranged as a species of mystery or miracle play. The translator was now able to render the whole text more complete by the addition of a fragment of a duplicate copy, containing ten lines, recently found by Mr. George Smith in the British Museum. In an appendix to his revised translation, Mr. Talbot presented the authorities for the various philological alterations introduced, and an exegesis of the more important words and variants in the Assyrian text.

3. "On the Egyptian Altar at Turin." Drawn by Joseph Bonomi, and described by Samuel Sharpe.—This altar, or more properly base of an altar, is of dark granite, with four vertical columns, each containing twenty-one lines, of finely executed hieroglyphics. At the lower part of the altar is a figure of a priest "beloved by Ptah of Memphis," who is named in the cartouche Pepi, a monarch of the VIth Dynasty. As the name of the monarch has evidently been recut, and the style of art approaches that of the Ptolemaic period, Mr. Bonomi was inclined to believe that the monument was of that later date. The paper was accompanied with three plates, which, with those illustrating Mr. Bosanquet's paper, will appear in the *Transactions*.

4. "Translation of the Hieroglyphic Inscription upon the Granite Altar at Turin." By S. Birch, F.S.A., President.—This paper showed that the altar was probably one of those in the Hephaestum at Memphis, and that it was interesting as giving the names of the deities then worshipped. The first column (A) contained the Ark of the God Socharis, and the Coffin of Osiris Tat, and below the name and titles of Pepi, "the Good God Pepi the giver of life, beloved of Ptah, who is the chief of the southern wall, approved of Sekhet;" in the third compartment stands Thoth of Eshmoun (Hermopolis) with his speech to the gods of the South. The other columns (B and C) contained the names and epithets of the various deities of the West and South; and the fourth (D) a list of the offerings presented to them, in which occur many new words, of which the meanings were given.

LINNEAN SOCIETY (Thursday, May 7).

THE following papers were read, viz.:—

1. "On some Atlantic Crustacea from the Challenger Expedition." By R. V. Willemoes-Suhm. Among the many deep-sea crustaceans which have been brought up either by the dredge or the trawl during the *Challenger's* cruise in the Atlantic, the most interesting are described in the present paper; in addition to descriptions of both sexes of the interesting *Nebalia* from the shallow water of Bermuda, some remarks on the male and the structure of *Cyrtosoma* (*Thaumops*), and some additions to our knowledge of the natural history and development of a land-crab from the Cape de Verdes islands. More detailed descriptions of these forms are given than in the reports already printed elsewhere, as well as an attempt to settle their systematic position. The paper is divided into seven parts as follows:—(1) On a blind deep-sea Tanaid; (2) On *Cyrtosoma Neptuni* (*Thaumops pellucida*); (3) On a *Nebalia* from Bermudas; (4) On some Genera of Schizopoda with a free dorsal shield; (5) On the Development of a Land-crab; (6) On a blind deep-sea *Astacus*; (7) On *Willemoesia* (Grote), a deep-sea Decapod allied to *Cryon*.

2. "On a New Australian Sphaeromoid (*Cyclura venosa*); and Notes on *Dynamene rubra* and *D. viridis*." By the Rev. T. R. R. Stebbing. This form belongs apparently to a new genus. It was found in Sydney Harbour, under stones, at the lowest ebb-tides.

4. "Descriptions of Five New Species of *Gony-leptes*." By A. G. Butler, F.L.S. These are additional to the monograph of the genus already published by the writer.

6. "On the Discovery of *Phylica arborea*, a tree of Tristan d'Acunha, in Amsterdam Island, in the South-Indian Ocean; with a communication of the Phanerogams and Vascular Cryptogams of that island and of St. Paul's." By Dr. J. D. Hooker, V.P.L.S. Labillardiere stated in 1791 that the islet of Amsterdam (generally confounded with that of St. Paul), lat. $37^{\circ} 52' S.$, long. $77^{\circ} 35' E.$, in the Indian Ocean, was covered with trees; while that of St. Paul, only fifty miles south of it, is destitute of even a shrub. The nature of this arborescent vegetation has been unknown until H.M.S. *Pearl* touched at the island in the summer of 1873, when Commodore Goodenough brought off a specimen of what he states to be the only tree growing in the island, together with a fern in an imperfect state. The former proves to be the *Phylica arborea* of Tristan d'Acunha, and the fern a frond of a *Lomaria*. Amsterdam Island and Tristan d'Acunha are separated by about 5,000 miles of ocean; and Dr. Hooker discusses the various hypotheses which suggest themselves to account for the extraordinary fact of the occurrence of the same species in such widely separated localities—viz., winds, birds, oceanic currents, and a former continuous land-connexion, all of which present great difficulties. Reichardt gives, in the *Verhandl. der k. k. Gesellsch. der Wissen.* of Vienna for 1873, a list of eleven plants collected on St. Paul's Island; one of these appears to be *Spartina arundinacea*, a plant also only known elsewhere as a native of Tristan d'Acunha.

7. "Contributions to the Botany of the Challenger Expedition":—No. 15, "Notes on Plants collected in the islands of the Tristan d'Acunha Group." By H. N. Moseley. The only published accounts of the flora of Tristan d'Acunha are by Du Petit Thouars in his *Mélanges*, and by Captain Carmichael in the *Transactions of the Linnean Society*, vol. xii. The area of the island is sixteen, and not two, geographical square miles, as stated in Grisebach's *Vegetation der Erde*. No. 16, "List of Algae collected by Mr. H. N. Moseley at Tristan d'Acunha." By Dr. G. Dickie, F.L.S. Two new species are described.

9. "Observations on the Fruit of *Nitophyllum vernicolor*." By Mrs. Merrifield. The paper contains a description of the coccidia of this species hitherto unknown, although the plant was described in 1800.

10. "On *Hieracium wilhetense*, DC." By C. B. Clarke, F.L.S. The writer disagrees with Mr. Benthams identification of this species with *Ainsliaea angustifolia*, Hook. f. et Thoms.

11. "Notes on Indian Gentianaceae." By C. B. Clarke, F.L.S. The paper contains a list of Indian Gentianaceae, with remarks on those species, especially the Bengal ones, of which the writer has sufficient materials to justify any. The sources are his own herbarium, that of Mr. Kurz, and the collection belonging to the Calcutta Botanic Gardens.

12. "Additions to the Lichen Flora of New Zealand." By Dr. J. Stirton. The lichens here described were collected by Mr. John Buchanan, of the Colonial Museum, Wellington, N.Z., and include a large number of species now described for the first time. The lichen flora of New Zealand is an unusually rich one; but while the phanerogamic flora of the islands diverges widely from that of countries in a corresponding European latitude, its cryptogamic flora shows closer affinities, and this is especially the case with regard to the lichens. In the Angiocarpous section there is a singular discrepancy in the colour of the spores of several species from New Zealand from that of lichens which in other respects must be identified with them from other parts of the world.

13. "Enumeratio Muscorum Cap. Bonae Spei."

By J. Shaw, F.L.S. The general results arrived at in this paper are summed up as follows:—1. The great majority of the Cape mosses are of northern-hemisphere types, a few being cosmopolites. 2. Some Australian and New Zealand forms are represented; a much larger proportion than is the case with flowering plants. 3. Many forms are strictly localised to particular soils and conditions of climate. 4. The Moss flora of the Cape is characterised by an almost total absence of Alpine forms.

ROYAL GEOGRAPHICAL SOCIETY (Tuesday, May 11).

At the usual fortnightly meeting of the above Society, a large assemblage was gathered together to hear an account of the West Coast of Africa from Sir John Glover and other officers connected with the late Expedition.

Sir J. Glover said that the great obstruction to their progress lay in the slavery prevalent there. The slave-masters would put their slaves in chains to prevent them joining the expedition. After crossing the Prah, on January 30, they advanced through Odumaset to Akropong, where the mountains and forests commenced. Numerous gold pits or shafts were here dug on either side of the road, galleries being an improvement in mining unknown to the natives. There must still, Sir J. Glover thought, exist a large quantity of gold in the country, and the laziness of the people would offer no obstruction to any foreign mining enterprises. Carriage, it must be remembered, was the great difficulty. The timber in the forests was most magnificent, the trees being straight, and rising 180 feet without a branch, while past Aguna the wood was of a valuable description, half teak, half mahogany. It was a mistake to suppose horses and mules would not live in the country, the death of some they had taken out having been caused by want of grass. He (Sir J. Glover) had received much assistance from the German Basle missionaries, who had furnished him with some capital native troops.

Sir Garnet Wolseley paid a tribute to the energies and pains of the late Captain Huyshe, who collected a great deal of geographical information supplemented by careful observations of altitudes, levels, and bearings. The women were undoubtedly made of much better stuff than the men, a fact to which Captain Glover had alluded. The name of England stood very low on Sir Garnet's first arrival, but at his departure it was raised to the highest pinnacle, a change which would prove of the greatest service to future explorers. The human sacrifices were incessant, and England should do her best to stop this atrocity, to put down which it would be worth while to expend treasure and risk lives. He concluded by expressing a hope that the importation of arms would be prohibited, a step which would tend to choke slavery.

Captain Fremantle said he did not look upon the Ashantees with the same amount of admiration that some people did. They were not so very unlike the Fantees after all. There was ample opportunity for the development of a thriving trade, and up country the climate was by no means so bad.

Mr. Hutchinson, secretary to the Church Missionary Society, said that Captain Glover had kept off no less than 20,000 men from attacking Sir Garnet, and that his services ought thus to be ranked very highly. The missionaries who had been released from Coomassie were ready, he could assure the meeting, to return to their work.

Sir Bartle Frere read a letter from Dr. Livingstone, written about two months before his death, in which the Doctor expressed his determination to labour in the war against slavery. The same feeling, the speaker said, had animated our noble troops, and the day would come when Africa would bless those who had carried the British arms into those regions.

We regret to be compelled by the pressure upon our space to defer till next week our report of the Anniversary Meeting of the Philological Society, held last night.

FINE ART.

MATERIALS FOR A LIFE OF GILLRAY.

April 27, 1874.

The writer of an article in the current number of the *Quarterly Review* on "Gillray and his Successors" has made good use, with all due acknowledgment, of the new matter regarding this artist to be found amongst the manuscripts in the British Museum, which was first published in the *ACADEMY* of February 28. He has not, however, had the curiosity himself to search through the volume containing the papers quoted, though he might by so doing have made his article far more complete. At the risk of making this subject wearisome, I have selected from the same collection a few more extracts for publication, more especially relating to the failure of the scheme of republishing the *Anti-Jacobin*, and to Gillray's connexion with Canning. These are the more important as the information is derived from Gillray's own letters, copies of which seem to have been carefully preserved.

No date is attached to the copy of the first letter, but it must have been written a little previous to November 1800; neither is the name of the person to whom it is addressed given. This is it:—

"27 St. James Street.

"Sir,

"I know that your kindness will excuse the liberty which I take in once more troubling you concerning the *Anti-Jacobin* in which I was engaged. What I would request of you is, that if Mr. Canning should again mention anything concerning the Plates, &c.:—that you would have the goodness to inform him that I am convinced it is necessary (from some circumstances which have come to my knowledge this week) for me after I have taken off half a dozen impressions, in order that by showing them in that state, I may take all the blame upon myself for their being stopped, and thereby disappoint the fomenters of a disagreeable public altercation which seems intended to take place, and for which the Plates seem intended as a stalking horse. I last week rec^d a letter from Mr. John Gifford, editor of the *Anti-Jacobin Review*, wishing to see me on 'particular business.' I went to him last Monday—he shewed me the copy of what Mr. Wright calls his 'Statement of Facts'—and told me he should publish it in the *Anti-Jacobin Review* with Notes &c.; but hinted that, if I chose to sell him the Plates, he might be induced to stop it. I was convinced from the positive manner in which he spoke that it was better not to give a positive refusal, as in that case he would publish it directly. I therefore told him that I would consider of it and let him know in a few days—this morning Mr. Wright called upon me frightened out of his wits, having been most woefully threatened by Peter Porcupine, for having divulged to me, that he (P. P.), was the author of the 'Statement of Facts';—in short, they are all together by the ears. I have taken the liberty of enclosing a copy of a letter which I wrote to Mr. Gifford this moment, as it will serve to explain—and would beg the particular favor (if you find it convenient), that you would hint the contents of it to Mr. Canning, as I wish very much to retain his good opinion and fear that in the jangling which seems intended to take place, it may chance that my conduct may be attempted to be placed in a false point of view.

"I am, &c.,

"J. GILLRAY.

Monday Even^g."

Peter Porcupine was, of course, none other than the redoubtable William Cobbett.

The next letter, probably addressed to the same person, is one of thanks for the very generous representation made to Mr. Canning concerning the publication of the *Anti-Jacobin*. Gillray adds: "I am certain that if it had not been for your kind interference, I should have lost entirely a Patronage which it is my highest ambition to retain."

The third letter, which is dated November 1, 1800, is a very long one, so a few portions of it must content us.—

"Mr. Frere called in St. James's Street, and left word that he wished to see the designs for the *Anti-Jacobin*—having in my agreement with Mr. Wright engaged not to show them to any person whatever, I was under the necessity of declining shewing them to that gentleman—who did me the favor of an answer containing what I must confess astonish'd me very much, and has astonished every person to whom it has been shewn, viz. 'the utter aversion of the authors of the *Anti-Jacobin* to its publication.' I had indeed before heard that objections had been made to its appearing with *personal satire*, but as I had also been positively informed that 'whatever appearances of dislike the authors found it prudent to alledge *publicly* against the plan of the work as I had undertaken it, the fact was that they would be highly gratified upon its appearance.'"

Further on Gillray writes:—

"I have no way left but that of giving up the publication entirely—and I will endeavour to banish the remembrance of it from my mind, for I believe, that was I to reflect much upon it and the damp it has cast upon all my hopes, and all my expectations, it would almost drive me mad:—to think of such a return for my endeavours to serve a cause which I thought myself honor'd in suffering every disadvantage for, hurts me beyond any thing I have met with, during a life made up of hardships and disappointments—but I have one consolation left, the attestation of my own heart to the purity of my own motives, and the reflection that during the three years and a half which have passed since Mr. Sneddy so kindly introduced me to the notice of Mr. Canning, it has been my incessant endeavour to prove myself not unworthy of the recommendation—that I have never in the least instance been actuated by mean or by mercenary views, to forfeit (*sic*) the honor which I esteem'd I had pledged—that I feel a pride in knowing that I have refus'd the most liberal offers from other quarters—that without a murmur I have been contented with receiving far less than the stipend which was absolutely promised me—that altho' I have not received a shilling from any quarter for the last Fourteen Months and have now labored half a year upon a work which will be thrown aside, and my character which was pledged for its production, forfeited to near six hundred generous subscribers, yet that still I have borne it all with patience, nor have I in any instance been guilty of an improper intention in the business. . . &c."

Among the miscellaneous papers in the volume is the following, relating doubtless to the marriage of Gillray's parents:—

"December 5th 22^d, 1751.

"James Gillray and Jane Coleman, of Chelsea, Middlesex.

"The above is a true Copy of the entry made in the Register-Book belonging to Mr. Keith's New Chapel, May-Fair, in the Parish of St. George Hanover-Square, and Liberty of Westminster, of the Marriage of the said Parties: By Virtue of a Licence made out on a Five Shilling Stamp. by me

"W^m LOVEDAY M^r."

"Witness
James Drummond Clerk."

As illustrations of our artist's intimacy with Miss or Mrs. Humphrey, we find preserved here a letter, addressed "Mr. Gillray at Lord Bateman's," which runs thus:—

"August 9th 1798.

"Dear Gillray.

"I received yours of the 7th inst, and am very glad to hear that you are so agreeably entertained you have really set my mouth watering. I only wish I could have put myself in the Box with your implements. I hope you will find them all right, I was yesterday at Chelsea and found your Father in good spirits. . . .

"Wishing you all happiness I remain yours sincerely

"H. HUMPHREY.

"P.S. Write soon and tell me all the news."

At the back of this is written:—

"Don't forget the Pidgeon Pye."

And two gossiping letters, dated at Brighton, in September and October, 1804, from the same writer to "Dear Gilly." J. J. CARTWRIGHT.

ROYAL ACADEMY EXHIBITION.

(Second Notice.)

OUR more detailed review may begin with the figure-subjects, as the most interesting class of pictures exhibited; dividing them roughly into groups, which, however, are formed more for convenience sake than as a strict or exhaustive division of the painters, who also occasionally will appear in more than one section. Into the question of the general character and position of our School, or the still more hazardous and intricate question what its future is likely to be, it is not intended to enter. But, as most of my fellow-labourers have attempted some estimate of the exhibition as a whole, I may venture to say that it seems to me to be more than commonly rich, both in pictures of really high merit, and in good work of a lower order; although in one or two respects, notably in portraiture, it falls below what might reasonably be desired, if not expected.

The complaint which has been raised, that landscape art has received niggardly treatment at the hands of the Hanging Committee (of whose names I am ignorant), seems to me unfounded. Here and there occur a few pictures, landscapes included, for which one would much like to effect an exchange with some pictures upon the line. Such are Mr. Hemry's *Tyne* (317); Mr. J. Knight's brilliant *Evening* (1,451); the *Muscul Gatherers* of Mr. Partington (1,351); the *Lesson in Geography* of M. Legros (1,015). Yet I say this with the consciousness that a nearer examination might not always support the wish expressed above, and with a strong feeling that the enormous difficulties of selection and arrangement have been justly and efficiently performed. And, as regards landscapes, it was the number of noteworthy pieces, either on the line itself, or within convenient view, which struck the writer on his first visit, before the contrary conclusion found its way to the newspapers.

I begin with figure-pictures classifiable as historical, literary, or poetical, without meaning to imply an absence of the latter quality elsewhere. Mr. Marks is, perhaps, the most prominent English artist in that school which looks, more or less, to archaeological material for the groundwork of its appeal to our interest. Of his three cabinet pictures, the one presenting a lady some four centuries back (I suppose), examining the bonnet of the day in a mercer's open shop (125), has lively expression and a pleasing arrangement of colour and chiaro-scuro; yet, like Mr. Calderon's *Queen of the Tournament* (335), his parallel performance, the interest is rather divided between antiquity, and art, and character-rendering, than impressively concentrated on any one of these elements of attraction. The *Strike* (179), Mr. Marks' largest, has more variety in character among its numerous figures, and the figures themselves lie more in that sphere, just above the merely grotesque, which but seems to suit the artist's genius. I shall in this, and in many cases, presume that the reader either knows the general contents of a picture from notices already given, or will prefer the pleasant process of learning them himself to my verbal description. It will then be enough to add that the very clever work before us is rather dry in colour, and with a certain stiffness in the *pose* of the figures, which, however, may accord with the awkwardness of the moment to all parties concerned. The *Page of Rabelais* (388) strikes me as more complete as a work of art: the landscape and open air effect are very truthful, and the pleasure, almost physical in its intensity, which the somewhat aged student of the great French humourist expresses, could hardly be more pleasantly rendered.

Mr. Calderon shows a more perfectly painted specimen in his girls dozing over their books (166), on a burning summer's afternoon, in a room half-darkened by closed shutters. This scene seems to want more grace, or more humour, to render its expressional qualities equal to its technical. May I add, without hypercriticism, that the semi-jocose

title, *Half-hours with the Best Authors*, is in a style "more honoured in the breach than in the observance." After a moment's smile at its ingenuity, surely a name of this kind detracts from the real value of the picture.

In his large and highly-finished *Picture Gallery* (157) that very clever artist, M. Alma-Tadema, relies less upon his remarkable mastery of antiquarian detail than usual. His pictures, with all their display of manipulation (dexterous, if not altogether delightful), often seem intended rather as illustrations to a Dictionary of Antiquities than as illustrations of the Art of Painting. In the present case, without quitting this somewhat artificial or over-literary region, the artist's great skill has managed to concentrate his interest on the human heads—the young Roman staring hard at a picture, the lady behind, less overtly expressing her criticism, the goodnatured and delighted owner, whose beaming face reveals perfect satisfaction in the value of his treasure. These figures are placed in a lofty, uncomfortable-looking room, the walls of which display a gallery which does not speak highly of the connoisseur's discernment. But the representation of a picture within a picture, by the nature of the case, is always one of the doubtful, the unsatisfactory points of art. The *quality* of the light in this striking work seems to me competent, without exactly reaching excellence; the lighting, in its scheme and management, is admirable. Archaeology triumphs in M. Alma-Tadema's smaller work, *Joseph in Pharaoh's Granaries* (300).

Other specimens in this higher class of figure-subject, worth attention, will be found in Mr. Boughton's *Canterbury Pilgrims* (982), with its scattered groups and pretty whitethorn background; in Sir J. Gilbert's *Field of the Cloth of Gold* (620), full of liveliness and *bravura*; and in Mr. A. Hughes's *Convent Boat* (584). Mr. Hughes rarely fails in a delicate and truly poetical conception of his work; and this picture (so far as its position enables me to judge) is also rendered with much feeling and truth to natural tone. The composition has that unstudied air which one notices also in Mr. Hook's figures; the background is unusually successful.

It has been often said of our art, that a want of variety or of elevation in the subjects chosen proves inadequate cultivation on the part of the artists. Whether this be true or not, no one can deny that in regard to the two points just specified no deficiency is ever exhibited by Mr. Leighton, obviously one of the most accomplished of our painters. There is none to whom we can look so securely for that degree of pleasure which arises, not from art indeed of powerful grasp, or fresh with the freshness of nature, but from grace in design and daintiness of colour, from unfailling fertility of invention, from the presence, lastly, of the high spirit which never evades the difficulties of a subject, and often conquers them. These qualities in Mr. Leighton's art I respect and admire too much not to believe that—were he willing, perhaps, to restrain this inventive wealth—to obey, rather than to outrun the bias of Nature—his work might more uniformly attain, from all points of view, the level which it aims at reaching. Probably there is no English painter—no painter, indeed, anywhere, now that Ingres is gone—who could adequately render us a Clytemnestra watching for the beacon-fires of Agamemnon (981); unite the statuesque association with the tragic intensity of the moment; give the air of life, and not forfeit the poetical atmosphere of antiquity. The figure here (to the writer at least) falls far below this arduous mark; it has ponderosity rather than grandeur: as the earthy brown and gray of the colour displays more of funereal conventionality than the ethereal sweetness of the Grecian night. The treatment is neither that of the theatre, nor of sculpture, nor of real humanity; the finest point seems to me the limpid severity of the cruel and unwavering eyes.

The same difficulties obviously beset the colossal *Prometheus* (687) which we owe to Mr. W. Richmond, and they should be vividly before our minds as we try to judge it. He has truly given us here a memorable figure, both in the attitude of restrained power and the features of heroic defiance; and the management of the landscape, with its dropping moon and wheeling sea-birds, has a reserve and a simplicity which harmonise well with the figure within those limits of style, ideal or conventional, to which the artist has restricted himself. In short, it is not, I think, exaggerated praise to say that, if this picture had been produced two centuries and a half ago, it might have been welcomed in the Farnese or the Barberini Palace, and borne a fair comparison with the work of those Bolognese artists who reached a fame in their day to which our day, it must be confessed, is almost wholly indifferent.

We shall meet Mr. Richmond honourably again in a sphere of art which has, at any rate, not lost its interest to his contemporaries. Returning to Mr. Leighton, whatever be the judgment of spectators upon this and his other pictures, based on high poetical subjects, there will be but one uniform sense of pleasure in his Moorish and Oriental pieces (131, 303). The *Dream of Granada* (131) shows a lovely little garden, one mass of rich foliage, traversed by a canal alive with rushing water, and inhabited by two splendid peacocks, and a very fair child who is running with her favourites. The somewhat unreal light, and the monotonous tone of the foliage, may be accepted as suiting the atmosphere of a dream; but, although this is the most brilliant of Mr. Leighton's pictures, the veritable qualities of air and light appear to me more fully reached in the interior view of a house at Damascus (303): a lovely courtyard full of sweet tones of stone and tile decoration and lemon-foliage, with another beautiful little girl, who catches the fruit in her outstretched lap. The delicate colour and folds of her dress leave nothing to be desired; they have the artist's usual grace, with that look of truthfulness which the pursuit of grace often sacrifices. Mr. Leighton's *Antique Juggling Girl* (348), after the above two works, is disappointing. Not that here are fewer points of dainty colour and graceful detail; but the insipid character of the subject does not, as it were, support or justify them: we think rather of the painter's skill than of his picture. Perhaps the awkward look of the much-foreshortened features may be in fault here. This attitude, also, appears to be unnecessary for the action: the head being more thrown back than the angle of the golden balls which the girl is flinging up quite requires.

There is this misfortune in Oriental subjects, that, like novels the scene of which is laid far off, the interest of the mass of spectators can hardly, or only inefficiently, be awakened. Mr. Lewis, who in technical perfection stands where few have stood since the days of the great Dutch masters of the art, has often suffered under this law. Two, however, of his pictures now shown have each so clear and satisfactory a subject that I hope their unique merit will not pass unrecognised. In the *Bazaar at Cairo* (332) we have at last before our eyes, with a completeness of power in every direction—drawing, colour, light and shade, sense of character, feeling for grace of line—one of those scenes on which all travellers love to dwell, and which most readers of travels love to skip. In the *Lady receiving Visitors* (354), on the other hand, we are admitted into the private life of the East. The lady visitor is announced by her servants, who accompany her, to the attendant maid of the owner; the latter is reclining in her special divan; the visitor at present stands on the further side of a marble tank. These pictures, however, must be studied, not described. As special points, where all is so fine in quality, I may note the wonderful and yet wholly different luminosity of the skies in each case: deep and glowing in the *Bazaar*; pale yet even more glowing in the other;

together with the Stothard-like grace of the figures. There is not a line here without thought; not a tint trusted to accident.

Painters who take their subjects from literature, novels and history in particular, have formed a distinct class in our school during this century; although perhaps our younger men do not now so often devote themselves to this style. Amongst these, Mr. Orchardson has tried more than once the perilous task of attempting to illustrate Shakespeare; but although he is an obviously clever artist, the difficulties in this case have been far too much for him (as they have proved for many others), and, indeed, are of a nature which cleverness and artistic dexterity, even of a much more powerful kind, would be quite insufficient to meet. The scowling Hamlet (265) and conventional Ophelia (380), which we find here, can be accepted by no one as in any way true to the mark; nor is Mr. H. O'Neil's attempt at the latter subject (579) more successful. Mr. Orchardson has a more satisfactory incident-scene in his fugitive who has escaped a couple of blood-hounds (1,415). But about all his work, and that of Mr. Pettie, there is a thin flashy sketchiness, a constant and intrusive presence of the conventionalities of the studio, as much in the painting as in the choice of material, and all brought into more prominence by the cleverness of the painters. The *State Secret* (223) seems to me a specimen of this quality; in the very smartly-painted scene from England under Puritan rule (1,362), Mr. Pettie's craftsmanship shows itself more pleasantly.

Although dexterity of this kind is apt soon to harden into incurable mannerism, these artists have youth on their side, and may reach other things. The Academy holds several others, more or less devoted to the same class of subject, who have long since made their mark and formed their style. We all owe them much pleasure; they characterise a certain phase in our school, and are a part of its history; their manner will be familiar to every reader; and in a brief notice like this it will be sufficient to do little more than name their main contributions. Mr. Frost recalls the days of Etty in his graceful little *Serena* (173). Mr. Elmore has an unaffected and well-composed group from *Peveril of the Peak* (327), painted with much care. Mr. Poole and Mr. Dobson (to diverge a little from literary art, if I may so call it), both artists of a well-recognised gift for grace and charm (qualities which not a few contemporaries of note make us value the more by contrast), seem, to a spectator at least, often to quit their work at a stage when it is not sufficiently brought near to nature in completeness and refinement to do justice to their ideal. A very pleasing little group by Mr. Poole (451); Mr. Dobson's girl with goats (405), are in the best vein of the artists.

Mr. Ward's frequent choice of subjects from French history might form the subject for a curious inquiry, how far material so decidedly foreign and modern at once is safe ground. He has, however, made this, with a certain section of English history, his own, by many very conscientiously considered and firmly designed works. He is eminently a manly artist; within the limits of his technical power, his grasp of the subject is unusually complete. Mr. Ward's colour-system is one which now seems falling out of fashion; but, taking it as a thing fixed in his practice, I remember few works by him more satisfactory in every way than the *Last Sleep of Marie Antoinette* (43), which he now exhibits. We are reminded of Frank Stone by Mr. Horsley's *Poet's Theme* (344); need it be said, what it is? And Mr. Cope has a scene from Shakespeare (261), another from Scott (80), and a mother whose energetic efforts to *Hush thee, my baby!* appear likely to be followed by an opposite result (1,406).

F. T. PALGRAVE.

M. LE BARON DE TRIQUET died at Paris on Tuesday night, from the effects of an operation.

THE SALON OF 1874.

(Second Notice.)

Paris: May 7, 1874.

AN attentive study of the Salon only confirms the favourable impression produced by a first visit. Without dwelling upon details, and explaining the merit of the works exhibited simply in a common-sense point of view, we propose to pass the galleries in review as if we had a visitor at our elbow who had but an hour or two at his disposal, and required a competent guide.

Of official portraits we shall say nothing. Beside the portrait of Prince Louis Napoleon, by his old drawing-master, M. Lefèvre, to which we have already alluded, there are a portrait of Marshal MacMahon on horseback, and portraits of M. Thiers and Mr. Washburne, by Mr. Healy, an American artist. M. Carolus Duran obtains a brilliant success, even among artists, who, as a rule, do not view him with much favour. He has the portrait of his grand-daughter, standing, with a little dog by her side, and the portrait of the Marquise de Pourtales; she is seated in an arm-chair, dressed in black silk, with jet ornaments, and an *aigrette* in her hair. The features are regular, with a rather haughty expression, bearing traces of the fatigues of worldly life. The hands, thin and transparent, are singularly charming, and may without exaggeration be compared with the aristocratic hands of Vandyke. M. Carolus Duran, whose talent is always characterised by energy, never attained such distinction before. We may also mention portraits of a young Alsatian lady, by M. Henner; of M. Legouvé, the Academician, by M. Delaunay; and of an old man, by a new exhibitor, M. Bastien Lepage: his subject, very simply dressed in a thick brown overcoat, is sitting in a garden-walk, with his spectacles on his nose, and a snuffly handkerchief thrown over his knee. The key of colour is very light.

This movement in favour of lightness, which is of English origin, is just now the object of much criticism in Paris, especially in the case of landscape painting. M. E. Manet is one of the artists who have made it their great object to give the school this new bent. He has been denied, discussed, made a laughing-stock, insulted, refused admission to the Salons; but in the end the recognition has been extorted that his doctrine was good, even if his works were not faultless, and he has been more or less openly followed, as Courbet, a master incomparably more potent, was followed some years ago. M. Manet's picture of *The Railway*—the only picture out of three sent in accepted by the jury—is "caviare to the general." But critics are impressed by the freshness of colouring, the truth of the drawing, the simplicity of the general effect. The jury is utterly in the wrong in its treatment of M. Manet and his pupils or friends. But the latter have done this year what they should have done long ago, and what M. Manet himself should have imitated. They have formed a society at the instigation of a very distinguished and thoughtful artist, M. Edouard Degas, and have taken quarters in the Boulevard des Capucines, where they exhibit a collection of a hundred pictures, all belonging in point of execution to the same school. But I cannot deal with this to-day.

Battle-pieces are much less numerous than formerly, when they used to be ordered by the Imperial Government. They will one day have disappeared almost wholly, as they have in England. [Our correspondent has not heard of the great success of Miss E. Thompson's picture of this year.] If the Republic triumphs, it will be the harbinger of a great reform in ideas and manners. The most important will be to prove that the French people has never been by preference a specially warlike people. But France has been, more than other nations, the prey of ambitious men. At the present time she is husbanding her forces; in gaining by slow degrees the notion of science, she is gaining that of liberty, and the

native good sense of the people is making its voice more clearly heard. Battle-scenes, therefore, no longer present the traditional spectacle of a host of enemies, overthrown, beaten, vanquished, by a handful of braves. We have studied, alas! in the school of nature, the real conditions of fatigue, of courage, of misery on the march, of swift or lingering death on the field. Base flattery of the vanity of the soldier, or the pride of the staff, is in vogue no longer. The return to truth is the most unmistakable symptom of that regeneration which is slowly progressing in those classes which Gambetta justly called the "new social strata," and which constitute the genuine French nation.

M. Auguste Lançon—who draws for the illustrated journals, and has engraved a series of episodes of the beginning of the war of 1870 and the siege of Paris, and who was arrested after the Commune, but soon released—has painted a mournful scene which he entitles *Morts en ligne*! A mitrailleuse has just moved down a whole rank of chasseurs, like so many toy soldiers; the corpses have retained in death the gestures of life and the expression their faces bore at the moment when they were stricken down. In the background, the village of Bazailles is in flames; on the right, the baggage-waggons of the Bavarian corps have halted on the route, and the band is playing triumphal airs. It is naturalistic painting, without charm of colouring or of touch, but its energy calls up strong emotions.

M. Guillaume Régamey, who is known, I believe, in England, has translated with great accuracy the mystery of night covering an advanced post of Algerian sharpshooters.

Three pictures have a special attraction for the public. One is by M. A. de Neuville, who had a great success last year with *Les dernières Cartouches*. It represents a battalion of *mobiles* scaling a railway embankment, and receiving the bullets of the Prussians, who are lying in ambush on the further side among the woods. It is a little melodramatic. The second is a memory of the siege, by M. Dupray. General Ducrot and Admiral la Roncière le Noury, followed by their staff, are visiting the zone which lay beneath the protection of the forts. The attitudes are very accurate, and the Parisians shiver at the recollection when they see once more the snow-clad ground and icy mist which made the absence of wood, coal, and provisions so cruel to bear. M. Edouard Detaille has chosen one of the saddest adventures into which we were thrown by the thoughtlessness, ignorance, and want of care displayed by the Imperial staff. On the day of August 6, 1870, during the battle of Reichshoffen, the ninth regiment of cuirassiers galloped into the village of Monbronn. It had sent forward no scouts! At a sharp turn in the main street, the first squadron dashed against a barricade formed of overturned waggons. A frightful confusion ensued, in the midst of which the Prussians, from their ambuscade, fired point-blank at our unfortunate troops. M. Detaille, who is not naturally very tender, has drawn up like a *procès verbal* the detail of this deplorable affair. His picture is somewhat cold in effect. But the sight of these poor wretches taken between two fires from the houses on either side, and powerless either to advance or to retreat, or to defend themselves, makes our very blood creep.

Let us next call attention to a very brilliant decorative painting by M. Henry Lévy: *Sleep and Death* (*Iliad*, Book vi.) bringing to Zeus the body of his son Sarpedon. It is in the tone of our masters of the eighteenth century, with that distinction in gesture and in colouring with which Eugène Delacroix has impregnated the contemporary school. M. Puvion de Lavallée has exhibited a large panel intended for a church, *Charles Martel after the battle of Poitiers*. This delicate and distinguished painter has gained new force. His drawing is always very ingenious, very supple, his tone has the same ideal transparence as of old;

but the modelling—that is what expresses the reliefs, and what gives the idea of the solidity of the bodies—is incomparably more vigorous than in former years. It is inconceivable that the French Government should not long years ago have attached to its service, by important orders worthy of the State, the artist who possesses the most exquisite and most chaste decorative ideas of any since Prud'hon.

There are no very important *débuts* among the landscapists. A pupil of Vollon, M. Guillemet, has painted a large view of Paris, taken from the bridge which crosses the Seine at Bercy. The general effect is excellent, but the drawing still a little uncertain. M. Pelouze, whose first works were applauded, has fallen this year into commonplace facility. The same reproach generally must be brought against the young school: they often have very correct impressions; they rub in rapid and attractive studies. But when they have to draw a picture from them, that is, to express in its secret details the inner being of a place, of a season, of an hour, so as to enable us to direct thither not only our steps, but also our memories and our reveries, they prove but too well that improvisation no more suffices in painting than in literature, and that every perfect creation of art is the result of a long course of self-criticism.

By way of compensation, the "old" painters, who had grown feeble, have recovered all their verve: Corot, Daubigny, Nazon, an artist too little known, unequal, sometimes fantastic, but possessed of singular power when, as in this Exhibition, he is successful.

M. François Bonvin, whom you have had for some time in England, exhibits two pictures which have won the suffrages of the best judges; this sober painting and scholarly drawing being scarcely appreciable by those who love the tinsel or the tricks in which the painters of Spanish scenes delight. One represents a woman in a kitchen cleaning a brass vessel; the background reminds one of Pieter de Hooghe. The other is a young boys' school; you can read their little characters in their faces, as they sit in rows on the benches, and listen with an abstracted air, or work or think.

Mdme. Darru, who signs her maiden name, although she is the wife of the painter Héreau, has sent some *Wild Flowers*, a village nosegay, as fresh and fragrant as though it had just been plucked along the hedgerows and in the meadow. Her husband, who has just been condemned to six months' imprisonment by the third Council of War for helping Dalou, the sculptor, to save the Louvre, has painted some remarkable sea-pieces, among others two views on the Thames, one near Erith and the other at Billingsgate. But the most remarkable flower-paintings of the Salon are by M. Fantin, who has this year surpassed himself.

An English surgeon, Sir Henry Thompson, does honour to his master, also a very remarkable painter, Mr. Alma-Tadema, by a painting of still life, representing flowers, a tortoise, and a Delft plate.

PH. BURTY.

ART SALES.

The following pictures were sold in Paris on Monday and Tuesday week:—

English School—*Intérieur de Forêt*, J. Crome, 5,000 fr.; *le Wensum la Nuit*, J. B. Crome, 5,000 fr.; *Portrait de Gainsborough*, by himself, 10,000 fr.; *Environs de Ventnor, Ile de Wight*, Ibbetson, 5,500 fr.; *Portrait de Tan-che-qua*, Sir Joshua Reynolds, 6,500 fr.; *le Château de Kilgarren*, 33,000 fr., *le Banquet de Guildhall*, Turner, 12,200 fr.

Flemish School—*Portrait de Martin Pepyn*, Van Dyck, 31,000 fr.; *Métier de Cavalerie*, Van der Meulen, 3,520 fr.; *la Maitairie*, D. Teniers le jeune et Roques, dit Zorg, 8,500 fr.

French School—*Les Huitres*, F. Desportes, 3,000 fr.; Honoré Fragonard: *le Premier Baiser*,

8,200 fr., *le Printemps et l'Été*, 19,900 fr.; *Plaisirs Champêtres*, Pater, 23,500 fr.

Dutch School—*le Goûter*, Beyeren, 13,000 fr.; *le Partage du Butin*, Le Duck, 6,800 fr.; *Portrait d'Homme*, L. Flinck, 7,050 fr.; *Nimègue*, Van Goyen, 8,900 fr.; *le Château*, Van der Heyden, 16,160 fr.; *le Maison de Campagne*, Hobbema, 69,500 fr.; *Nature Morte*, Konink, 8,000 fr.; *le Peseur d'Or*, Metsu, 40,000 fr.; *l'Yssel au Clair de Lune*, Van der Neer, 11,000 fr.; *la Leçon de Chant*, Netscher, 13,200 fr.; *Paysage d'Italie*, Pynacker, 5,700 fr.; *le Déjeuner d'Huitres*, Uchertvelt, 6,000 fr.; *la Meuse devant Dordrecht*, Verschuur, 24,500 fr.; *les Bords du Rhin*, P. Wouwerman, 34,000 fr.

Italian School—Guardi, *la Fête du Bucentaure au Déclin du Jour*, 6,000 fr., *un Coin de la Place Saint-Marc*, 9,000 fr.

Modern pictures—Eugène Delacroix: *Lion dévorant un Lapin*, 35,200 fr., *l'Appartement du Comte de Morny*, 5,200 fr., *la Franciade d'Abydos*, 32,050 fr.; Fontainebleau, Diaz de la Pena, 32,700 fr.; *Trompette des Hussards d'Orléans*, Géricault, 6,500 fr.; *l'Atelier de Rembrandt*, Leye, 11,000 fr.; *Caravane passant un Gué*, Marilhat, 9,600 fr.; Millet: *le Retour des Champs*, 8,200 fr., *la Quenouille*, 8,000 fr.; Mdme. la Comtesse de Barck, H. Regnault, 33,500 fr.; Troyon: *la Mare*, 26,000 fr., *la Charrette*, 24,000 fr., *Métairie Normande*, 7,100 fr.; Venise, par Ziem, 4,500 fr.

The total of the sale was 914,734 fr.

NOTES AND NEWS.

WE understand that the Dean and Canons of Christchurch, Oxford, intend at last to settle the vexed question of the new bell tower at the corner of "Tom" quadrangle by a competition, to which the following architects have been invited to send designs: Sir G. G. Scott, Messrs. G. Bodley, Jackson, Basil Champneys, Deane, and Hugo. The drawings are to be submitted next Monday, May 18.

It is rumoured that the trustees of the parish church at Hampstead are thinking of pulling down the characteristic old tower at the end of Church Row, and replacing it by a modern construction. The church is an excellent, though simple, specimen of the architecture of the middle of last century, and forms a perfect and harmonious termination to the double line of uniform houses in the old secluded street, which is one of the most beautiful specimens of a group of last century buildings remaining in this country. And it is difficult to comprehend the motives of this restless and irresponsible vandalism, which seems likely only to exhaust itself when it shall have effected a complete clearance of every object round which the sweet and sober associations of the past still linger.

MR. LEIGHTON'S *Helen of Troy*, a painting which was exhibited at the Royal Academy in 1865, is at this moment again to be seen in London, at Mr. McLean's Gallery in the Haymarket. This picture has recently come into the market, owing, we believe, to the death of the original purchaser. At the present moment, when another exhibition of the Royal Academy shows four recent paintings by the same artist, *Helen of Troy* possesses a peculiar interest, as it enables us to compare Mr. Leighton's work in 1865 with Mr. Leighton's work in 1874. We are thus able not only to test the strictness with which he has now for years pursued very definite aims in art, but to assure ourselves of the great and real progress which has been made towards realising them. *Helen of Troy* is an attractive and graceful invention, dignified by that nobility of purpose which always informs Mr. Leighton's work, a picture which might well be a source of true satisfaction to the possessor; but if we turn from *Helen of Troy* to the *Clytemnestra* which he has this year given us, we shall at once perceive an immense advance in the command of technical

resources. The rendering of the idea in *Clytemnestra* is wholly adequate to the high order of the conception, so that it comes home to us complete, and weighted with the full force of solemn and elevating beauty. The treatment is conspicuous for a gravity and vigour in which the Helen, charming as it is, seems to us now deficient.

THE famous vase of Mantua and the seal of Mary Stuart, restored by virtue of a treaty between the city of Geneva and the heirs of the Duke of Brunswick, are now deposited in the ducal palace at Brunswick.

It may be well to call the attention of art-lovers to the sale, which is to take place on the 20th instant, of the pictures of the late Gainsborough Dupont, grand-nephew of Thomas Gainsborough, and himself a painter. The collection includes works by Murillo, Salvator Rosa, Rembrandt, Vandyke, Rubens, Gainsborough, West, Teniers, Northcote, and others, besides a valuable collection of engravings. It is to be hoped that the fact of the sale taking place at the late owner's house, Wigan End, Sudbury, will not lead to the pictures being buried in small country drawing-rooms, instead of being added to the national collection or some other worthy of receiving them.

THE French Photographic Society has just opened its tenth public exhibition at the Palais de l'Industrie.

THE restoration of the cathedral at Metz is being prosecuted with zeal and success, and the north-west transept is now complete.

THE German papers announce the death, on April 25, at the early age of thirty-five, of the artist Renier Dahlen, one of the most original and talented of the younger members of the Düsseldorf school of painting.

M. LELAURAIN has recently made an important archaeological discovery at the Champ-du-Trésor, at Reims. It is an immense cemetery of the early Gallo-Roman epoch, and yielded about a hundred vases, and urns of earthenware and glass, all of different designs, artistically wrought bracelets of bronze; bronze and silver coins of various emperors; hair-pins of silver, bronze, and jet; rings, stiles, &c. The most curious tomb is that of a Vestal, buried at a depth of 2½ metres; the coffin contained four vases of earthenware, one of which was for incense, with handles in the shape of a serpent; a silver spoon, scalloped all over, which served to take up the incense to throw it in the fire on the altar; two jet bracelets; and round the neck were ten bronze and silver coins of Gallienus, Probus, Claudius, Valerian, &c.

Two remarkable sculptures have lately been discovered on the Esquiline Hill, referring to the worship of Mithra. The first, in good preservation, is an exquisite group representing the sacrifice of the bull. The other, of more ordinary workmanship, is a bas-relief of great interest from an archaeological point of view, as it unites all the symbols of the worship of Mithra, including that of a human sacrifice, which was rarely accomplished. The name of the individual who caused the monument to be put up is inscribed upon it, and traces of gilding and painting are discernible. The authorities have ordered the two sculptures to be deposited in the Sala delle Colonne, where they will be exhibited to the public.

We learn with regret that Sir Digby Wyatt has been compelled, in consequence of ill-health, to resign his post of architect to the India Office. Sir Digby Wyatt's name has often appeared in conjunction with that of his friend, Mr. Owen Jones. It was together that they worked with all their energies in carrying out their plans in the Great Exhibition of 1851. It was together, again, that they designed the Fine Art Courts of the Crystal Palace; and, for the last time, their names appeared together on Monday, when Sir Digby Wyatt took part in the meeting that had

for its object the erection of some fitting memorial to his late colleague. We trust that Sir Digby Wyatt has taken timely heed of his health, and that this diminution of his work will soon restore his over-taxed powers.

THE little church of Stretford, in Herefordshire, is about to be restored, and it is much to be hoped that its interesting features may not suffer by this perilous process. At the present time it is in just the same condition as when Dingley visited it two centuries ago (see *History from Marble*, vol. ii. p. 93). On the roof are the arms of Delabere, Devereux and Baskerville, and in the aisles may still be seen the "two fair ancient monuments so like one another that in tracing off the one you represent the other." Each of these monuments consists of a slab bearing the recumbent effigies of a knight and his lady, rather less than life-size and somewhat rudely carved, and there does not appear to be the slightest difference between them in respect of age or execution. The arms on the knights' shields are those of Delabere and, if Dingley's sketch be accurate, the figures in his time lay beneath a canopy ornamented with ball-flowers. But the most singular feature in the church (or rather in its chancel) is what Blount calls "a large case of stone," which traditions in his day affirmed to be the shrine of the martyrs Cosmas and Damian. The upper part of the "case" is decorated with crockets and ball-flowers, but the recess in which the figures of the two saints stood is devoid of all ornament, and is in fact nothing but a stone cupboard attached to one of the chancel pillars. A little way below the church is a well dedicated to the same saints, and reputed to possess special virtues.

THE new number (April) of the *Revue Archéologique* opens with a very interesting account of the finding of several cinerary urns at a place called Pogio Renzo, near Chiusi, the ancient Clusium. The urns themselves differ little from the same class of objects found in the early Etruscan cemeteries, of which that of Villanova is the best known. The patterns are all linear, and consist of zigzags, squares, imitations of network, and an approach to the meander. Nor in their contents do these urns present any striking novelty, except, perhaps, in the case of the bronze razors. But what is really remarkable about them is the manner in which they were deposited in a sort of well, built to their size and shape of rough unhewn stones without mortar, like the Cyclopean walls of Tiryns in miniature. The writer of the article in the *Revue*, M. Alexandre Bertrande, has no doubt that these urns date from a time anterior to the Etruscan civilisation. One of his arguments seems conclusive. Quite near to where the urns were found there had also been uncovered several tombs, the contents of which left no doubt as to their Etruscan origin. Now, the earth which had been originally cast up in digging these tombs is found to have been thrown over the hillock under which lay the urns in question.

THE meeting held at the house of Mr. Alfred Morrison, last Monday, to consider the question of raising a public memorial in recognition of the late Owen Jones's services to decorative art, was numerously attended by his friends and admirers. It was agreed that the memorial should take, in the first instance, the form of a mosaic portrait of the late artist, to be offered to the nation, and set up in South Kensington Museum, and that an exhibition of his works should be organised to which possessors should be invited to contribute such as they deemed desirable; and further, that if any balance remained in hand after the carrying out of these two schemes, that it should be applied to the foundation of a scholarship in that particular branch of art to which Mr. Owen Jones had devoted his energies and genius. A liberal subscription was made before the meeting broke up.

PERSONS who are smitten with the prevalent mania for collecting old china will perhaps be interested to learn that in the *Chronique* of

April 18 and May 2 they will find a detailed history and description of the celebrated potteries of Saint-Amand-les-Eaux, by Frédéric Fétis. These potteries were established in 1718 by Pierre-Joseph Fauquez, and remained in his family for several generations. The mark on this pottery is a monogram comprised of the letters "S. A. P. F." in writing capitals, which M. Fétis interprets, "Saint-Amand, Pierre Fauquez." In the later works of the manufactory the letters "S. A." were eliminated from the cipher and placed in plain Roman capitals at each side of it. Both forms of the mark are given in the *Chronique*. Happy will be the collector who by means of this mark is able to identify some doubtful idol among his fetishes.

THE fifty-ninth anniversary of the Artists' General Benevolent Institution was celebrated by a dinner at Willis's Rooms on Saturday last. Sir Henry James presided and made a good speech. Many of the most distinguished of our artists were present, and among them we noticed the name of Alma-Tadema, who is now, be it remembered, a naturalised English subject.

THE Retrospective Exhibition for the benefit of the poor of Alsace and Lorraine attracts such crowds of visitors that it has been determined to open it earlier, and to keep it open later, than was at first intended. The public will for the future be admitted from 9 a.m. to 5 p.m., by the payment of two francs before twelve o'clock, and five francs afterwards. This seems nowadays rather a high price to pay for an art exhibition, but then a better return than usual is made for the money. The notion of a loan exhibition is more of a novelty in Paris than in England; indeed, it may be said that this is the first that has been carried out successfully. It was suggested, it is said, by the Duc d'Aumale, who no doubt took the idea from our Manchester, Bethnal Green, and Old Masters' Exhibitions, but the Comte d'Haussonville has been the principal agent in carrying it into execution. Its success is even greater than was anticipated. Besides the tapestries, rare old furniture, and other curiosities and antiquities, there are more than a thousand paintings exhibited, and many of them very fine works.

A CONTEMPORARY states that M. Ferdinand Heilbuth is about to return to London from Rome, and that he will bring with him several paintings, among them one representing a party assembled at an excavation made on the site of the palace of the Caesars. Less than a century ago M. Heilbuth would have had to pay a heavy duty for importing these fruits of his genius and industry into England. In that gossipy little book called *A Book for a Rainy Day*, by J. T. Smith, is printed a letter from the fair Angelica Kauffman to Lord Camelford, in which she begs his lordship to assist the English artists then studying in Rome in their endeavour to obtain the free importation into England of the studies, models, and designs made during their stay abroad:—

"The heavy duty," she writes, "set upon articles of that nature causes that the artist whose circumstances do not permit him to pay, perhaps, a considerable sum, must either be deprived of what he keeps most valuable, or buy his own works at the public sale at the custom-house. This I have myself experienced in coming to England—and I mention it here in consequence of the opinion of some of my friends who think that my assertion, added to what other artists have reported to that purpose, may be of some use to obtain their object."

The letter is dated 1787.

A VERY fine collection of modern bronzes is being exhibited at the Institute. The great superiority of the ancient Japanese bronzes at the recent Oriental Exhibition in the Palais de l'Industrie induced MM. Bouillet and Christoffe to make researches in the hope of finding out the secret of this superiority, and the result has been very satisfactory. They have recovered, it is said,

the three fundamental colours—black, red, and brown—used by the Japanese, and altogether the works they now exhibit are admirable reproductions of ancient Oriental bronzes.

THE STAGE.

THE ACTING IN "LE SPHINX."

Paris: May 12, 1874.

M. OCTAVE FEUILLET has good reason to be grateful to his actors, and not to Mademoiselle Croizette alone; for it is they who have made his *Sphinx* so genuinely successful that on the twenty-seventh night of its representation—which is much, be it remembered, for the Théâtre Français—the audience was not only as densely packed, but as closely attentive as on the first. Not but that something is due to M. Feuille himself, whatever criticism may have to say of his deficiencies. The play itself would have been less abused had it been less successful. Then many a critic would have proclaimed the interest of the story who now busies himself with proclaiming its faults. There must be something in a play which lasts three hours without provoking a yawn; and supposing even, as I do indeed here suppose, that the acting counts for very much in exciting and sustaining this interest, it must still be conceded that for so much good acting there must be some little foundation in the dramatist's own work. The truth is, that out of a striking novelette M. Feuille has made a play, which somehow, owing to changes here and there, some small, some very important, is not striking as one reads, but is nevertheless capable of profiting by the kind of acting which, though one looks for, one does not always get, even at the Théâtre Français.

You leave the theatre with the impression that you have been made the confidant in a family secret, and that the stage characters, with one or two exceptions, are people whom you know. You read the play, and the colour, the vividness, and the reality, have gone from the characters. It is a mere story, and the people are puppets, and they are cleverly pulled, but with their fortunes you have nothing to do. M. Feuille has drawn faint outlines, and his merit is, that such as they are, they are drawn clearly, without confusion, so that there is room for elaboration. Put them into the hands of Coquelin *cadet*, of Joumard, of Febvre—bit by bit the colour will come, and this dry dust be made flesh. So it is with the secondary characters. One or two of the principal characters are made real also, very real, by the skill of the actors; but, though real, they are never strongly marked—types it is possible to believe in: not individuals we met yesterday and shall meet again to-morrow. Of such is one of the two heroines, Blanche de Chelles; who is, I think, a worse woman at heart than the author himself believes her to be, and who is represented just now in London by Mme. Favart; in Paris by Croizette.
